

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# ORGANIZATION OF THE STAFF.

## EDITOR-IN-CHIEF.

**CHARLES KENDALL ADAMS, LL. D.,**

PRESIDENT OF THE UNIVERSITY OF WISCONSIN,  
**History, Politics, and Education.**

## ASSOCIATE EDITORS.

**LIBERTY H. BAILEY, M. S.,**  
Professor of Horticulture, Cornell University.  
**Agriculture, Horticulture, Forestry, etc.**

**WILLIS J. BEECHER, D. D.,**  
Professor of Hebrew Language and Literature,  
Auburn Theological Seminary.  
**Presbyterian Church History, Doctrine, etc.**

**HENRY A. BEERS, A. M.,**  
Professor of English Literature, Yale University.  
**English Literature, etc.**

**CHARLES E. BESSEY, Ph. D.,**  
Professor of Botany, State University of Nebraska.  
**Botany, Vegetable Physiology, etc.**

**DUDLEY BUCK,**  
Composer and Organist, Brooklyn, N. Y.  
**Music, Theory of Harmony, Musical Terms, etc.**

**FRANCIS M. BURDICK, A. M., LL. B.,**  
Dwight Professor of Law, Columbia College, New  
York.  
**Municipal, Civil, and Constitutional Law.**

**GEORGE P. FISHER, D. D., LL. D.,**  
Professor of Church History, Yale University.  
**Congregational Church History, Doctrine, etc.**

**GEOVE K. GILBERT, A. M.,**  
Geologist, U. S. Geological Survey.  
**Physical Geography, Geology, and Paleontology.**

**BASIL L. GILDERSLEEVE, LL. D.,**  
Professor of Greek, Johns Hopkins University.  
**Grecian and Roman Literature.**

**ARTHUR T. HADLEY, A. M.,**  
Professor of Political Economy, Yale University.  
**Political Economy, Finance, and Transportation.**

**MARK W. HARRINGTON, A. M., LL. D., F. L. S.,**  
Chief of the U. S. Weather Bureau.  
**Geography, Meteorology, Climatology, etc.**

**WILLIAM T. HARRIS, LL. D.,**  
U. S. Commissioner of Education, and

**J. MARK BALDWIN, Ph. D.,**  
Professor of Experimental Psychology, College of  
New Jersey.  
**Philosophy, Psychology, Ethics, etc.**

**JOHN F. HURST, D. D., LL. D., Bishop (M. E.),**  
Chancellor American University, Washington.  
**Methodist Church History, Doctrine, etc.**

**SAMUEL MACAULEY JACKSON, D. D., LL. D.,**  
Editor of A Concise Dictionary of Religious Knowl-  
edge, and associate editor of the Schaff-Herzog En-  
cyclopædia, New York.  
**General Church History and Biblical Literature.**

**HENRY E. JACOBS, D. D., LL. D.,**  
Professor of Systematic Theology, Evangelical Lu-  
theran Theological Seminary, Philadelphia, Pa.  
**Lutheran Church History, Doctrine, etc.**

**DAVID S. JORDAN, LL. D.,**  
President Leland Stanford Junior University.  
**Zoology, Comparative Anatomy, and Animal Physi-  
ology.**

**JOHN J. KEANE, D. D., LL. D., Bishop (R. C.),**  
Rector of the Catholic University of America.  
**Roman Catholic Church History, Doctrine, etc.**

**CHARLES KIRCHHOFF, M. E.,**  
Editor of the Iron Age, New York.  
**Mining Engineering, Mineralogy, and Metallurgy.**

**STEPHEN B. LUCE,**  
Rear-Admiral, U. S. Navy.  
**Naval Affairs, Naval Construction, Navigation, etc.**

**ARTHUR R. MARSH, A. M.,**  
Professor of Comparative Literature, Harvard Univ.  
**Foreign Literature, etc.**

**JAMES MERCUR,**  
Professor of Mil. Engineering, West Point Mil. Acad.  
**Military Engineering, Science and Munitions of War,  
etc.**

**MANSFIELD MERRIMAN, C. E., Ph. D.,**  
Professor of Civil Engineering, Lehigh University.  
**Civil Engineering, etc.**

**SIMON NEWCOMB, LL. D., M. N. A. S.,**  
Editor of the U. S. Nautical Almanac.  
**Astronomy and Mathematics.**

**EDWARD L. NICHOLS, Ph. D.,**  
Professor of Physics, Cornell University.  
**Physics, Electricity and its Applications.**

**WILLIAM PEPPER, M. D., LL. D.,**  
Provost of the University of Pennsylvania.  
**Medicine, Surgery, and Collateral Sciences.**

**WILLIAM S. PERRY, D. D. Oxon., LL. D., Bishop (P. E.),**  
Davenport, Iowa.  
**Episcopal Church History, Doctrine, etc.**

**JOHN W. POWELL,**  
Director of the U. S. Geological Survey.  
**American Archaeology and Ethnology.**

Professor of International Law, Yale University.  
**Public Law, Intercourse of Nations.**

## MANAGING EDITOR.

**ROBERT LILLEY, M. R. A. S.,**

ONE OF THE EDITORS OF THE CENTURY DICTIONARY.

## ASSISTANT TO THE EDITOR-IN-CHIEF.

**CHARLES H. THURBER, A. M.,**

PROFESSOR OF PEDAGOGY, COLGATE UNIVERSITY, AND PRINCIPAL OF COLGATE ACADEMY.

# JOHNSON'S UNIVERSAL CYCLOPÆDIA.

VOL. VII.

## CONTRIBUTORS AND REVISERS.

- \***ABBOT, EZRA, S. T. D., LL. D.,**  
Professor of New Testament Criticism and Interpretation, Cambridge Divinity School, Cambridge, Mass.
- ABBOT, HENRY LARCOM, LL. D., M. N. A. S.,**  
Colonel U. S. Engineers; brevet brigadier-general U. S. army, New York.
- ADAMS, CHARLES KENDALL, A. M., LL. D.,**  
President of the University of Wisconsin, Madison, Wis.
- ADAMS, CYRUS C.,**  
Editorial staff of *The Sun* (New York); President of Department of Geography, Brooklyn Institute, Brooklyn, N. Y.
- ADAMS, HENRY C., Ph. D.,**  
Professor of Political Economy and Finance, University of Michigan, Ann Arbor, Mich.
- ALEXANDER, JOSEPH H.,**  
Cashier, Union Savings-bank, St. Charles, Mo.
- ALGER, PHILIP R.,**  
Professor of Mathematics, Bureau of Ordnance, Washington, D. C.
- ALLEN, CHARLES H.,**  
Formerly principal of State Normal School, San José, Cal.
- ALLEN, FREDERIC STURGES, A. B., LL. B.,**  
Member of the New York Bar, New York; one of the editors of *Webster's International Dictionary*.
- AMES, JAMES BARE, A. M.,**  
Bussey Professor of Law, Harvard University, Cambridge, Mass.
- ANDERSON, HON. RASMUS B.,**  
Formerly Professor of Scandinavian Languages, University of Wisconsin; ex-U. S. minister to Denmark; Madison, Wis.
- ANTHONY, SUSAN B.,** Rochester, N. Y.
- ARMSTRONG, SAMUEL T., M. D., Ph. D.,**  
One of the collaborators of *Foster's Encyclopædic Medical Dictionary*, and editor of an American Appendix to *Quain's Dictionary of Medicine*; New York.
- ASHHURST, JOHN, JR., A. M., M. D.,**  
John Rhea Barton Professor of Surgery and Professor of Clinical Surgery in the University of Pennsylvania, Department of Medicine, Philadelphia, Pa.
- ATTEBURY, WILLIAM W., D. D.,**  
Secretary of the New York Sabbath Committee, New York.
- ATWOOD, ISAAC M., D. D.,**  
President of the Canton Theological School, St. Lawrence University, Canton, N. Y.
- BAILEY, LIBERTY H., M. S.,**  
Professor of General and Experimental Horticulture, Cornell University, Ithaca, N. Y.
- BAKER, IRA OSBORN, C. E.,**  
Professor of Civil Engineering, University of Illinois, Champaign, Ill.
- BALDWIN, J. MARK, Ph. D.,**  
Stuart Professor of Experimental Psychology, College of New Jersey, Princeton, N. J.
- BARTON, CLARA,**  
President of the American National Red Cross, Washington, D. C.
- BEACH, O. B.,**  
With R. Hoe & Co., printing-press manufacturers, New York.
- BEADLE, WILLIAM H. H., LL. D.,**  
President of the State Normal School, Madison, S. D.
- BEAVER, W. J.,** of Roe & Beaver, San Bernardino, Cal.
- BEECHER, REV. WILLIS J., D. D.,**  
Professor of Hebrew Language and Literature, Auburn Theological Seminary, Auburn, N. Y.
- BEERS, HENRY A., A. M.,**  
Professor of English Literature, Yale University, New Haven, Conn.
- BELKNAP, LIEUT.-COM. CHARLES, U. S. navy,**  
Head of Department of Mechanics and Applied Mathematics, U. S. Naval Academy, Annapolis, Md.
- BENJAMIN, MARCUS, Ph. D., F. C. S.,**  
Editorial staff of the *Standard Dictionary*, and of *The Annual Cyclopædia*, New York.
- BESSEY, CHARLES E., Ph. D.,**  
Professor of Botany and Horticulture, University of Nebraska, Lincoln, Neb.
- BIGELOW, FRANK H., A. M.,**  
Professor of Meteorology, U. S. Weather Bureau, Washington, D. C.
- BIRGE, EDWARD ASAHEL, Ph. D.,**  
Professor of Zoölogy and dean of the College of Letters and Science, University of Wisconsin, Madison, Wis.
- BLAKE, WILLIAM P., A. M.,**  
Geologist and mining engineer, Shullsburg, Wis.; formerly Professor of Mineralogy and Geology, College of California, Oakland, Cal.
- BLAND, RICHARD P.,**  
Ex-Member of Congress from Missouri; Lebanon, Mo.
- BLUNT, CAPT. STANHOPE E., U. S. army,**  
Watervliet Arsenal, West Troy, N. Y.

- GEORGE, HENRY,  
Author of *Progress and Poverty*, etc., New York.
- GIDDINGS, FRANKLIN H., A. M.,  
Professor of Sociology, Columbia College, New York.
- GILBERT, GROVE KARL, M. N. A. S.,  
Geologist, U. S. Geological Survey, Washington, D. C.
- GILDERSLEEVE, BASIL L., Ph. D., LL. D., D. C. L.,  
Professor of Greek, Johns Hopkins University, Baltimore, Md.
- GILL, THEODORE N., A. M., M. D., Ph. D., LL. D., M. N. A. S.,  
Professor of Zoölogy, Columbian University, Washington, D. C.
- GILLET, REV. CHARLES R.,  
Librarian, Union Theological Seminary, New York.
- GILMORE, JOSEPH HENRY, A. M.,  
Professor of Logic, Rhetoric, and English, University of Rochester, Rochester, N. Y.

## PECULIAR PHONETIC SYMBOLS

### USED IN THE WRITING OR TRANSLITERATION OF THE DIFFERENT LANGUAGES.

- |  |   |
|--|---|
| <p>ā, ē, etc.: long vowels; in the Scandinavian languages the accent (á, é, etc.) is used to denote length.</p> <p>ą: a nasalized <i>a</i>; so used in the transliteration of the Iranian languages.</p> <p>å: labialized guttural <i>a</i> in Swedish.</p> <p>æ: open <i>a</i> of Eng. <i>hat</i>, used chiefly in O. Eng.</p> <p>af: used in Gothic to denote <i>e</i> (open), in distinction from <i>ái</i>, the true diphthong.</p> <p>au: used in Gothic to denote <i>o</i> (open), in distinction from <i>áu</i>, the true diphthong.</p> <p>bh: in Sanskrit a voiced labial aspirate (cf. <i>ch</i>).</p> <p>b̥: voiced bilabial (or labio-dental) spirant, used in discussions of Teutonic dialects.</p> <p>ç: voiceless palatal sibilant, similar to Eng. <i>sh</i>, used especially in transliteration of Sanskrit.</p> <p>č: frequently used, e. g. in Slavonic languages, to denote the sound of Eng. <i>ch</i> in <i>check</i>.</p> <p>c: voiceless palatal explosive, commonly used in transliteration of Sanskrit and the Iranian languages.</p> <p>ch: as used in the transliteration of Sanskrit, a voiceless palatal aspirate, an aspirate being an explosive with excess of breath; as used in German grammar, the symbol for a voiceless palatal or guttural spirant.</p> <p>dh: voiced dental aspirate (cf. <i>ch</i>) in Sanskrit.</p> <p>ḍ: voiced cerebral explosive, so used in transliteration of Sanskrit.</p> <p>ḍh: voiced cerebral aspirate (cf. <i>ch</i>) in Sanskrit.</p> <p>ṭ: voiced dental (interdental) spirant, equivalent to Eng. <i>th</i> in <i>then</i>; so used in the Teutonic and Iranian languages and in phonetic writing.</p> <p>ē: a short open <i>e</i>, used in Teutonic grammar, particularly in writing O. H. G.</p> <p>ə: the short indefinite or "obscure" vowel of Eng. <i>gardener</i>; used in the reconstruction of Indo-Eur. forms, and in transliterating the Iranian languages.</p> <p>gh: in Sanskrit a voiced guttural aspirate (cf. <i>ch</i>).</p> <p>g: voiced velar (back-guttural) explosive, used most frequently in Indo-Eur. reconstructions.</p> <p>ǵ: voiced guttural (or palatal) spirant, equivalent to Mod. Greek <i>γ</i>, and used in transliteration of Iranian languages and O. Eng.</p> <p>h̥: a voiceless breathing, the Sanskrit <i>visarga</i>.</p> <p>hv: a labialized <i>h</i>, similar to <i>wh</i> in Eng. <i>what</i>; used in transliteration of Gothic and the Iranian languages.</p> <p>h̥: voiceless guttural (or palatal) spirant, equivalent to German <i>ch</i>, and used in transliteration of the Iranian languages.</p> <p>ĭ: the semi-vowel <i>y</i>, or consonant form of <i>i</i>; used in phonetic writing and reconstructions of Indo-Eur. forms.</p> | <p>j: in the transliteration of Sanskrit and the Iranian languages a voiced palatal explosive; in the Teutonic languages a semi-vowel (= <i>y</i>), for which in Indo-Eur. reconstructions <i>i</i> is generally used.</p> <p>jh: in Sanskrit a voiced palatal aspirate (cf. <i>ch</i>).</p> <p>kh: in Sanskrit a voiceless guttural aspirate (cf. <i>ch</i>).</p> <p>l: the guttural ("thick" or "deep") of the Slavonic and some of the Scandinavian languages.</p> <p>l̥: vowel <i>l</i>; used in transliterating Sanskrit, in reconstructing Indo-Eur. forms, and in other phonetic writing.</p> <p>ṇ: nasal vowel; used in reconstruction of Indo-Eur. forms and in phonetic writing.</p> <p>ṇ̥: in Sanskrit the cerebral nasal.</p> <p>ñ: in Sanskrit the guttural nasal (see following).</p> <p>ṇ̥: the guttural nasal, equivalent to Eng. <i>n</i> in <i>longer</i>; used in transliteration of Iranian languages.</p> <p>ñ̥: palatal nasal, similar to <i>gn</i> in Fr. <i>regner</i>; used in transliterating Sanskrit and in phonetic writing.</p> <p>ō: palatalized <i>o</i>; used in German and in phonetic writing.</p> <p>Q: short open <i>o</i> in Scandinavian.</p> <p>ø: short palatalized <i>o</i> (ø) in Scandinavian.</p> <p>ph: in Sanskrit, voiceless labial aspirate (cf. <i>ch</i>).</p> <p>q: voiceless velar (back-guttural) explosive; used in reconstructions of Indo-Eur. forms and in other phonetic writing.</p> <p>r̥: vowel <i>r</i>; used in transliterating Sanskrit, in reconstructions of Indo-Eur. forms, and in other phonetic writing.</p> <p>ś: voiceless cerebral sibilant, equivalent to Eng. <i>sh</i>; used in transliterating the Iranian languages and in phonetic writing.</p> <p>ṣ: voiceless cerebral spirant; used in transliterating Sanskrit.</p> <p>th̥: in Sanskrit a voiceless dental aspirate (cf. <i>ch</i>).</p> <p>th̥: in Sanskrit a voiceless cerebral aspirate (cf. <i>ch</i>).</p> <p>ṭ̥: in Sanskrit a voiceless cerebral explosive.</p> <p>ṭ̥: a form of dental spirant used in transliterating the Iranian languages (represented in Justi's transliteration by <i>ṭ</i>).</p> <p>ṭ̥: voiceless dental (interdental) spirant, equivalent to Eng. <i>th</i> in <i>thin</i>; used in Teutonic dialects and in phonetic writing.</p> <p>u̥: consonant form of <i>u</i>; used in phonetic writing.</p> <p>z̥: voiced cerebral sibilant, equivalent to <i>s</i> in Eng. <i>pleasure</i>, and to <i>j</i> in Fr. <i>jardin</i>; used in Iranian, Slavonic, and in phonetic writing.</p> <p>z̥: a symbol frequently used in the writing of O. H. G. to indicate a voiced dental sibilant (Eng. <i>z</i>), in distinction from <i>z</i> as sign of the affricata (<i>ts</i>).</p> |
|--|---|

## EXPLANATION OF THE SIGNS AND ABBREVIATIONS USED IN THE ETYMOLOGIES.

>, yielding by descent, i. e. under the operation of phonetic law.

<, descended from.

=, borrowed without change from.

:, cognate with.

+, a sign joining the constituent elements of a compound.

\*, a sign appended to a word the existence of which is *inferred*.

## KEY TO THE PRONUNCIATION.

|   |   |
|---|---|
| aa..... as <i>a</i> in <i>father</i> , and in the second syllable of <i>armada</i> .                | ö..... as in <i>Göthe</i> , and as <i>eu</i> in French <i>neuf</i> , <i>Chintreuil</i>  |
| ä..... same, but less prolonged, as in the initial syllable of <i>armada</i> , <i>Arditi</i> , etc. | ü..... as in <i>but</i> , <i>hub</i> .  |
| a..... as final <i>a</i> in <i>armada</i> , <i>peninsula</i> , etc.                                 | û..... obscure <i>o</i> , as final <i>o</i> in <i>Compton</i> .   |
| ä..... as <i>a</i> in <i>fat</i> , and <i>i</i> in French <i>fin</i> .                              | ü..... as in German <i>süd</i> , and as <i>u</i> in French <i>Buzançais</i> , <i>vu</i> .   |
| ay or ä.. as <i>ay</i> in <i>nay</i> , or as <i>a</i> in <i>fate</i> .                              | y or l.... see <i>l</i> or <i>y</i> .   |
| äy or ä.. same, but less prolonged.   | yu..... as <i>u</i> in <i>mule</i> .  |
| ë..... as <i>a</i> in <i>welfare</i> .  | yü..... same, but less prolonged, as in <i>singular</i> .   |
| aw..... as <i>a</i> in <i>fall</i> , <i>all</i> .   | ch..... as in German <i>ich</i> .   |
| ee..... as in <i>meet</i> , or as <i>i</i> in <i>machine</i> .                                      | g..... as in <i>get</i> , <i>give</i> (never as in <i>gist</i> , <i>congest</i> ).  |
| ëë..... same, but less prolonged, as final <i>i</i> in <i>Arditi</i> .                              | hw..... as <i>wh</i> in <i>which</i> .  |
| e..... as in <i>men</i> , <i>pet</i> .  | kh..... as <i>ch</i> in German <i>nacht</i> , <i>g</i> in German <i>tag</i> , <i>ch</i> in Scotch <i>loch</i> , and <i>j</i> in Spanish <i>Badajos</i> , etc. |
| e..... obscure <i>e</i> , as in <i>Bigelow</i> , and final <i>e</i> in <i>Heine</i> .               | ñ..... nasal <i>n</i> , as in French <i>fin</i> , <i>Bourbon</i> , and nasal <i>m</i> , as in French <i>nom</i> , Portuguese <i>Sam</i> .                     |
| é..... as in <i>her</i> , and <i>eu</i> in French <i>-eur</i> .                                     | ñ or n-y.. Spanish <i>ñ</i> , as in <i>cañon</i> , <i>piñon</i> , French and Italian <i>gn</i> , etc., as in <i>Boulogne</i> .                                |
| i..... as in <i>it</i> , <i>sin</i> .   | l or y.... French <i>l</i> , liquid or mouillé, as (-i)ll- in French <i>Baudrillart</i> , and (-i)l in <i>Chintreuil</i> .                                    |
| ī..... as in <i>five</i> , <i>swine</i> .   | th..... as in <i>thin</i> .   |
| ī..... same, but less prolonged.  | th..... as in <i>though</i> , <i>them</i> , <i>mother</i> .   |
| ō..... as in <i>mole</i> , <i>sober</i> .   | v..... as <i>w</i> in German <i>zwei</i> , and <i>b</i> in Spanish <i>Cordoba</i> .   |
| ō..... same, but less prolonged, as in <i>sobriety</i> .  | sh..... as in <i>shine</i> .  |
| o..... as in <i>on</i> , <i>not</i> , <i>pot</i> .  | zh..... as <i>s</i> in <i>pleasure</i> , and <i>j</i> in French <i>jour</i> .   |
| oo..... as in <i>fool</i> , or as <i>u</i> in <i>rule</i> .   |   |
| ōō..... as in <i>book</i> , or as <i>u</i> in <i>put</i> , <i>pull</i> .                            |   |
| oi..... as in <i>noise</i> , and <i>oy</i> in <i>boy</i> , or as <i>eu</i> in German <i>Beust</i> . |   |
| ow..... as in <i>now</i> , and as <i>au</i> in German <i>haus</i> .                                 |   |

All other letters are used with their ordinary English values.

### NOTE.

The values of most of the signs used in the above Key are plainly shown by the examples given. But those of ö, ü, ch, kh, ñ, and v, which have no equivalents in English, can not be sufficiently indicated without a brief explanation, which is here given.

- ö. The sound represented by this symbol is approximately that of -u- in *hurt* or -e- in *her*, but is materially different from either. It is properly pronounced with the tongue in the position it has when ä is uttered and with the lips in the position assumed in uttering ö.
- ü. This vowel is produced with the lips rounded as in uttering oo and with the tongue in the position required in uttering ee, into which sound it is most naturally corrupted.
- ch and kh. These are both rough breathings or spirants made with considerable force, ch being made between the flat of the tongue and the hard palate, and kh between the tongue and the soft palate. ch approaches in sound to English sh, but is less sibilant and is made further back in the mouth; kh is a guttural and has a hawking sound.
- l or y. These are both used to represent the sound of French *l* mouillé, in (-i)ll- and (-i)l, which resembles English -y- in *lawyer*. Final *l*, that is, (-i)l, may be approximated by starting to pronounce *lawyer* and stopping abruptly with the -y-.
- ñ or n-y. The consonants represented by ñ (Spanish *ñ*, French and Italian *gn*, etc.) are practically equivalent to English -ni- or -ny- in *bunion*, *bunyon*, *onion*, etc., and, except when final, are represented by n-y. Final ñ, as French -gn(e), may be produced by omitting the sound of -on in the pronunciation of *onion*.
- v. This may be pronounced by attempting to utter English *v* with the use of the lips alone.

See PREFACE (vol. i., p. xxiv.) and the article PRONUNCIATION OF FOREIGN NAMES.

was wounded, June, 1596; was readmitted at court May, 1597; sailed with the Earl of Essex to the Azores in the same year and took Fayal, but quarreled with his commander and contributed to the ruin of Essex; obtained a grant of the fine manor of Sherborne, Dorsetshire; went as ambassador to the Netherlands 1600; became governor of Jersey 1601; lost favor at court on the accession of James I., was accused of conspiring to raise Lady Arabella Stuart to the throne, committed to the Tower in July, and condemned to death at Winchester, Nov. 17, 1603; suffered confiscation of his estates, which were given to Carr, the new favorite; was kept thirteen years in the Tower, during which time he wrote and published his principal work, *The History of the World* (1614); recovered his liberty, though not his pardon, through the influence of Villiers, Jan. 30, 1616; obtained from James a commission as admiral, and sailed with a fleet of fourteen ships for the discovery of his promised El Dorado in Guiana Mar. 28, 1617; had several engagements with the Spaniards, in one of which he lost his oldest son; lost several vessels, and was foiled in his objects; landed at Plymouth on his return June, 1618; was imprisoned on complaint of the Spanish ambassador, Gondomar, in consequence of his conduct in Guiana, and it having been decided by the judges that the sentence of death pronounced in 1603 was still valid, he was executed at the palace yard, Westminster, Oct. 29, 1618. Raleigh was a man of splendid genius and extensive attainments, wrote many miscellaneous, literary, and political essays, and a few poems of high order. His *Complete Works* were edited at Oxford in 8 vols. (1829). Biographies have been written by William Oldys, Arthur Cayley, P. F. Tytler, James A. St. John, and Edward Edwards, the two latter having appeared almost simultaneously in 1868. Revised by C. K. ADAMS.

**Rallidæ** [Mod. Lat., named from *Rallus*, the typical genus, from the Fr. *râle*, rail. See RAIL]: a family of birds including the rails and gallinules. The neck is moderately elongated; the head rather small; the bill more or less elongated, compressed, and with the culmen advancing to a greater or less extent upon the forehead and decurved toward the apex; the nostrils are lateral, rather inferior, and in a membranous groove; the wings moderate and rounded, rather short; the tail rather short, inclined upward, and rounded; the tarsi rather long and slender, and in front covered with transverse scutellæ; the toes three in front, and well developed, the hinder comparatively short and rather elevated; the claws curved and sharp.

Revised by F. A. LUCAS.

**Ralph, JAMES**: poet and pamphleteer; b. in Philadelphia, Pa., about 1698; became a schoolmaster in his native city, where he made some pretensions to literary ability; was an early friend of Benjamin Franklin, with whom he sailed for England 1724, abandoning his wife and child; published in 1728 a poem entitled *Night*, which was sufficiently bad to merit notice by Pope in the *Dunciad*; sought favor with the Whig politicians by writing pamphlets and plays; was patronized by Frederick, Prince of Wales, and received a pension on the accession of George III. D. at Chiswick, Jan. 24, 1762. Author of *Zeuma*, a poem (1729); *The Use and Abuse of Parliaments* (2 vols., 1744); *History of England* (2 vols. folio, 1744-46); and *The Case of Authors by Profession or Trade Stated* (1758). Revised by H. A. BEERS.

**Rāma**: See RĀMĀYĀNA.

**Ramadan**: Arabian form for RAMAZAN (q. v.).

**Ra'mah** [from Heb. *Rāmāh*, liter., lofty place]: the name of several places in Palestine, two of which are historically interesting and important. One of these, first mentioned in Josh. xviii. 25, and identified by Robinson in 1838, is on the top of a high hill about 5 miles N. of Jerusalem. It belonged to the tribe of Benjamin. The other, where Samuel was born (1 Sam. i. 1), has not yet been identified with certainty.

**Rāmā'yana** [Sansk. adject. *rāmāyana*, concerning Rāma, sc. noun *ākhyāna*, story]: the name of a celebrated poem of ancient India. It is the first great Indic literary or personal epic, as distinguished from the popular epic, exemplified in the *Mahābhārata*. Much critical work is yet to be done ere all the specific problems concerning the genesis of the poem can be solved; but their ultimate solutions are sure to be most illuminating for the student of the genesis of epic poetry. Respecting the general theory of the origin of the poem, see EPIC POETRY. The original nucleus of the *Rāmāyana* differs wholly from that of the *MAHĀBHĀRATA* (q. v.) in two most important respects: First, it is the work of

one man; and, second, it is of unitary design and character. The man is called Vālmiki—a fact quite bare of significance, as compared with the fact that he is namable; and whereas the *Bhārata* is inordinately episodic, and is in effect a great cyclopædia of Indic legend, the *Rāmāyana* concerns itself with the legends clustering about the one great name of Rāma.

Vālmiki's material (like that of the *Bhārata*) is truly popular. It consists of the legends of Rāma of the race of Ikshvāku in the land of Kosala. These were the subject of many little epic songs sung by the bards (*sūtas*) at the courts of the Ikshvāku princes. A Brahman, Vālmiki, of pre-eminent poetic gifts, made himself master of these songs, transfused them into a consistent whole, and so created an epos. This was learned by the professional rhapsodists, and by them recited in public. The date of the written reduction we do not know; but it was doubtless made while the institution of wandering minstrels or professional reciters of the poem was still in full vogue, and while their oral traditions of the poem possessed as much authority as the then extant written copies. It is probable that the fixation of the poem in writing took place independently in different localities, and that each of the now extant recensions is an independent reflex of one of the locally or otherwise varying oral traditions.

The most important recensions are three: One is the Bengali recension, edited by Gorresio; and another, the so-called "northern," which has the widest currency, and is the basis of the Bombay editions. The poem, like some mediæval cathedral, has suffered additions and changes at the hands of successive generations, but not in such wise as greatly to obscure its original compass and design. In its present form the *Rāmāyana* consists of seven books, of which, however, the first and last are doubtless later additions. The seven books contain about 25,000 double verses—say about twice as much as the *Iliad* and *Odyssey* together; but Jacobi believes that a reconstructed text would contain, after casting out all provable additions, some 8,000 or 10,000 double verses.

*Story of the Poem* (after Monier-Williams).—To Daśaratha, King of Ayodhyā, by his three wives, are born four sons: Rāma, the eldest; and, by Kaikeyi, Bharata. Rāma is taken to the court of King Janaka, and by his strength, shown in bending a wonderful bow, wins for his wife Sītā. He returns, and preparations are made to install him as successor to his father's throne. Kaikeyi now demands of Daśaratha—by way of fulfillment of an old promise that he would grant her any two requests she might make—that Rāma be banished, and her own son Bharata be made king. Rāma dutifully goes into exile with Sītā. The king dies in grief. Bharata goes and proffers Rāma the kingdom, and is refused.

Sītā is carried off by Rāvana, the demon-king of Lankā. The ape Hanumant seeks and finds her. Rāma makes alliance with Sugriva, king of the apes, and with his aid, and that of Vibhishana, brother of Rāvana, he invades Rāvana's capital, slays him, and recovers Sītā. He then returns to Ayodhyā and assumes his crown.

Here are two parts fundamentally different. Up to Rāma's refusal of the kingdom all is natural, human, and possible. From the rape of Sītā on, all is unnatural and fantastic to the last degree. This instructive combination is an instance of what has taken place also among other peoples—the mingling of heroic-legendary elements with mythological elements. The first part gives us the story of Rāma as a popular hero; the second blends the conceptions of Rāma the hero with those of Rāma the divinity. As early as the Rig-Veda, Sītā appears as the personified Furrow. She is a genius of the corn-field and wife of the rain-god. The battles of Rāma and Rāvana are only another form of the battles of the rain-god Indra with the demon of drought. What to the nomad herdsman of Vedic times was a penning up of the heavenly waters, that was to the husbandman of epic times a carrying away of the goddess of their corn-fields. Hanumant, son of the wind-god, is a rain-god, the genius of the monsoon, who recovers Sītā, i. e. brings back to life the dead and parched fields.

*Place and Date*.—The place of the human part of the poem is Kosala, the region about Ayodhyā (Oudh). There is not the slightest allusion to the most important fact in the pre-Christian political history of India, the empire of the great Mauryan dynasty of the neighboring Magadha, founded by contemporaries of Buddha, nor to its capital Pataliputra. In short, the whole political and geographical

**Hemiphaedusa** is the first statistical Unit within the prefecture of the Province of Coimbra. It is the North-eastern Portuguese Unit, between 38° 20' N and 25° 00' E, and between 78° 50' and 91° 00' E, the first group of N. Iberia, and 7° E. It is a first, first, and unclassified region. Area, 945 sq. miles. Pop., 1991, 591,245. The number of the units, in a considerable number of units, and is the first in the first group. Pop., 1991, 10, 10.

12. 94. 11. 8. 6. 5. 4. 3. 2. 1. 0.

**HUMPHRY, ALFRED**: poet; b. at Edinburgh, Leith-ship, Scotland, Oct. 15, 1836; was in early life a magazine and Edinburgh advertiser (from a book-keeper, and printed many poems Scottish and English, usually on "brotherhood" or "sisterly" clients. He obtained a respectable competence, and his bookkeeping having become a law unto itself at the literary men of Edinburgh he enlarged his law-bookkeeping a publisher and started his first circulating library in Scotland. The first collected volume of his poems appeared in 1870; others were more actual, of which the most popular were *The Everlasting Membership* (1874), *The Scottish Songbook, or Scots National Songs* (1875), and *A Collection of Scotch Poets* (1876). To him must be credited the preservation of many relics of ancient Scottish literature. In 1874 he published *The Fugitives*, an important collection of old Scotch songs. D. in Edinburgh, Jan. 7, 1898. The best edition of his poetical works is that of George Chapman (London 2 vols. 1890) now ed. Panchy (1914).—His son, ALFRED, b. in Edinburgh in 1873, was an eminent portrait painter at London; became principal painter to George III, 1867, and was at one time considered (though without reason) a rival of Sir Joshua Reynolds; the figure in literary circles as a friend of Dr Johnson, and published some pamphlets and an *Essay on the Poet*. At Dover, Aug. 6, 1894. (Revised by H. A. Murray.)

Report to the House

**Canaway, Sir Aylmer** Christian, F.R.S., geologist. B. in Glasgow, Scotland Jan. 31, 1844; educated in Glasgow; appointed a member of the Geological Survey of Great Britain, 1861; Director of Geological Laboratory, London, 1868; lecturer at Oxford School of Mines, 1867; was president of the Geological Society of London, 1892-94, and of the British Association for the Advancement of Science, 1893; became Honorary-General of the Geological Survey, 1892; was knighted in 1891. He was the author of numerous papers on the stratigraphical geology of the rocks in the province of Ayr (1844), North Wales (1856) and Scotland (1863); of *Palaeontological and Geological Notes of Great Britain* (1865); and of a large *Geological Map of England and Wales* (1865). D. Dec. 1, 1901.

Approved by C. S. Thompson.

**Ramsay, David, M. D.:** physician and author; b. in Lancaster co., Pa., Apr. 2, 1749; graduated at Princeton 1765; studied medicine at the University of Pennsylvania; settled as a physician at Charleston, S. C., 1773; served in the war of the Revolution as a field-surgeon, participating in the siege of Savannah; was a leading member of the South Carolina Legislature 1776-83, and of the council of safety at Charleston, on the capture of which city he was treated by the British as a hostage and kept eleven months in close confinement in St. Augustine, Fla., 1780-81; was a member of the Continental Congress 1782-84, and again 1785-86; was acting president of Congress during most of the latter period, on account of the sickness of Hancock; published a *History of the Revolution of South Carolina* (2 vols., Trenton, 1785), *History of the American Revolution* (2 vols., Philadelphia, 1789), a *Life of Washington* (New York, 1807), a *History of South Carolina* (Charleston, 1809), and *History of the United States 1607-1808* (3 vols., Philadelphia, 1816-17), besides medical and other essays. His first wife was a daughter of President Witherspoon, of Princeton; his second was Martha, daughter of Henry Laurens, and of her he published a memoir in 1811. During the last fourteen years of his life Dr. Ramsay was a member of the South Carolina Legislature, and for much of the time president of the Senate. D. at Charleston, May 8, 1815, from a wound inflicted by a lunatic two days before.

**Ramsay, William Mitchell, D. C. L.:** scholar; b. in Glasgow, Scotland, Mar. 15, 1851; was educated at the Universities of Aberdeen, Oxford, Göttingen, and Berlin; held the traveling studentship of Oxford University in 1879; was fellow of Exeter College in 1882; resided and traveled in Asia Minor 1880-84, and made frequent excursions to that land 1885-91; was Lincoln Professor of Classical Art and Archaeology in Oxford 1885; and since 1886 has been Professor of Humanity in Aberdeen University. Dr. Ramsay has published numerous articles in magazines of Europe and the U. S.: *Historical Geography of Asia Minor* (1890); *The Church in the Roman Empire before 170 A. D.* (1893); and *St. Paul's Travels: the Narrative, its Author, and Date*; Morgan lectures in Theological Seminary, Auburn, N. Y. (London, 1895). C. K. Horr.

**Ram'ses, or Ram'seses** (Egypt. *Rā-messu*): the name of thirteen Kings of Egypt belonging to the nineteenth and twentieth dynasties. **RAMESSES I.**, the first king of the nineteenth dynasty, ascended the throne at the close of a period of confusion consequent upon the religious reforms attempted by KHUNATEN (*q. v.*), during which the Nubians and the Shasu or Eastern nomads had thrown off the yoke of Egypt. All that is known of him is that he waged war in a small way in Nubia, where he left memorial stelæ; that he made a treaty with the Hittites; and that he did some building at Thebes, where he commenced the great hypostyle hall at Karnak. His chief claim to distinction is that he was the father of Seti I., one of the greatest of Egyptian warriors and conquerors, who claimed to have extended his sway till it included all that Thothmes III. had held. Seti thus handed on a united and powerful kingdom to **RAMESSES II.**, whom he had already associated, in his twelfth year, with himself as king. **RAMESSES II.** ruled for sixty-six or sixty-seven years. He was a powerful monarch, a great builder, and a liberal patron. The Greek writers ascribed to him many wonderful deeds under the name of Sesostris, but this name was a sort of conglomerate in which the personalities of several kings were combined, such, e. g., as Useraten II. of the twelfth, Ramses II. of the nineteenth, and Ramses III. of the twentieth dynasty. The name of Ramses II. is found on monuments or buildings from Beirut to Napata and from one end of Egypt to the other, as well as throughout the length of Nubia. (See *IPSAMBUL*.) In many cases, however, his name was inserted in the inscriptions of other kings by a process of usurpation in which he was the worst offender in Egyptian history. His principal residence appears to have been at Tanis, where he erected a granite temple which he adorned with a colossal statue of himself. At Thebes he erected the Ramesseum, besides extending the buildings of his predecessors. He built also at Abydos (see *MEMNONIUM*), at Memphis, and Heliopolis, besides a multitude of other places. The Ramesseum, a large temple on the W. of the Nile opposite Karnak, was devoted to the worship of the manes of the great Ramses. On its walls were inscribed the accounts of his wars, especially the account of the expedition against the Hittites which is commemorated in the famous poem of Pentaur.

His warlike operations began while he was coregent with Seti I., when he led expeditions into Nubia and Libya. Near Beirut are inscriptions which record his advance to that point in his second and fourth years. In his fifth year he marched against the Hittites, whose principal seat was in the region about Carchemish. With them were allied all the peoples of the entire region. At Kadesh, on the Orontes, battle was joined, and in the conflict Ramses was successful over Mäutenure, the Hittite king, largely by reason of his personal daring and prowess, if we may credit the monumental record. In his eighth year another expedition was undertaken against certain cities in Palestine, Ascalon being the principal place captured. In his twenty-first year Ramses entered into an offensive and defensive alliance with Chetasar, the Hittite king, and to confirm this treaty, which remained in force during the rest of his reign, he took to wife the daughter of the Hittite. In consequence, more intimate relations of friendship and trade were established between Egypt and the East. After a reign of sixty-seven (Josephus, sixty-six) years, Ramses died, and was succeeded by his son Menephtah (Egypt. *Mer-en-Ptah*, beloved of Ptah), who is usually regarded as the Pharaoh of the Exodus, under whom the kingdom rapidly lost prestige.

**RAMESSES III.** was the second king of the twentieth dynasty, and ten others bearing the same name followed in immediate succession. The period which preceded the reign of Ramses III. was almost one of anarchy, and in it even a Syrian appears to have succeeded in gaining temporary royal power. During the period following his death the power exercised by the priests was such as to lead to a speedy deterioration of the kingdom, and to a final usurpation of the throne by Hex-Hor (*q. v.*), the priest-king. Ramses III. waged war with the Libyans and with his neighbors to the N. E., the Hittites and their allies, while Punt and Ethiopia were forced to pay tribute. His reign was brilliant, and was commemorated on the walls of Ramses's memnonium at *MEDINET HABU* (*q. v.*), at Thebes, which in its various extensions presented the annals of the king. For ethnological purposes its mural decorations, giving life-like portraits of prisoners taken in war, are very valuable. See *Petrie's Racial Types from Egypt* (1887).

The most notable events of the following reigns were the thefts practiced in the necropolis at Thebes and elsewhere, in the times of Ramses IX. and X., which were made the subject of investigations. The results of these inquiries have come down to us, showing the extent of the depredations.

The mummies of the first three Ramses are at the Gizeh Museum, having been among those found in 1881 near Deir el-Bahri, W. of Thebes. CHARLES R. GILLET.

**Ramses, or Raamses:** the name given in Ex. i. 11 to one of the "store-cities" built by the Israelites for the Pharaoh of the Oppression, who usually has been identified with the great Ramses II. of the nineteenth dynasty. Its location is unknown, but it was probably a frontier town like PITHOM (*q. v.*). By some it is supposed to have been located in the Wadi Tumilat, W. of Pithom, while others identify it with Tanis, which in some inscriptions bears the name Pi-Ramses, dwelling or house of Ramses. C. R. G.

**Ramsgate:** town; in the county of Kent, England; on the southeast coast of the Isle of Thanet; 72 miles E. by S. of London (see map of England, ref. 12-L). It is an important fishing-station, with a harbor of refuge 51 acres in extent inclosed between two piers. Among its features are an iron promenade-pier, a beautiful Roman Catholic church designed by Pugin, a Benedictine monastery, and a Jewish college. It is much frequented as a watering-place by Londoners. Pop. (1891) 24,876.

**Ramus, Petrus** (Fr. *Pierre de la Ramée*): humanist and mathematician; b. at Cuth, department of Somme, France, in 1515, in humble circumstances; studied under great difficulties at the University of Paris, and published in 1544: his *Animadversionum in Dialecticam Aristotelis Libri XX.* and *Institutionum Dialecticarum Libri III.*, in which he attacked Aristotle and the scholastic method of philosophizing with great boldness. The university, the Church, the Parliament, took great offense; the books were condemned, and the author forbidden to teach. By the favor of the king he was nevertheless afterward appointed at the university, and continued till his death his opposition against the empty subtleties of the philosophy of his time. Among other works were *Geometria* (1569) and *Scholæ Mathematicæ* (1569). In 1561 he embraced Protestantism.

committee of vigilance chosen Mar. 10, 1773, and an efficient worker in promoting through correspondence a concert of action with the other colonies; presided over the Virginia convention at Williamsburg, Aug., 1774; was chosen a delegate to the Continental Congress; was first president of that body upon its meeting at Carpenters' Hall, Philadelphia, Sept. 5, 1774, though from ill-health he soon resigned that post; presided over the second Virginia convention at Richmond, Mar. 20, 1775; was again chosen president of the Continental Congress when it reassembled at Philadelphia, May 10, 1775, but resigned May 24, returning to Virginia to preside over the house of burgesses; resumed his seat in Congress a few months later. D. in Philadelphia, Oct. 22, 1775.

**Randolph, Thomas:** poet; b. near Daventry, England, in 1605; d. 1635. He was educated at Westminster and at Trinity College, Cambridge, of which he became a fellow. His plays include *Amyntas*, a pastoral comedy, and *The Muses' Looking-glass*, a morality in defense of stage-plays. His best-known poem is his *Ode to Sir Anthony Stafford*. He was a friend and disciple of Ben Jonson. II. A. B.

**Randolph-Macon College:** an educational institution chartered in 1830 and opened in 1832, endowed and sustained by the Virginia and Baltimore conferences of the Methodist Episcopal Church South. It was first located in Mecklenburg co., Va.; suffered severely during the civil war, and was removed in 1866 to Ashland, Hanover County, and re-endowed.—**RANDOLPH-MACON WOMAN'S COLLEGE**, Lynchburg, Va., is an endowed institution for women with courses of instruction parallel to those for men at Ashland. It was founded in 1891.—**RANDOLPH-MACON ACADEMY**, Bedford City, Va., was established in 1889 as a fitting school for the college; and **RANDOLPH-MACON ACADEMY**, at Front Royal, Va., practically a duplicate of the one at Bedford City, was established in 1891.—These institutions are all controlled by the board of trustees, and under the supervision of President William W. Smith, A. M., LL. D.

**Rangoon:** chief city of Burma, and third port in importance in British India; on the eastern arm of the Irawadi delta, 20 miles from its mouth (see map of S. India, ref. 4-L). It is in unimpeded connection with the main stream and with the coast, and is accessible for large craft. It is the center of a system of canals, and the terminus for two railways running northward, one to Prome, the other to Mandalay. It is provided with street-cars, fire brigades, and other modern improvements; but is badly built and unsanitary, with the houses often on bamboo piles, and the narrow streets intersected by canals. The teak forests in the region about it and the excellent character of the port early caused the development of a considerable ship-building industry, which has latterly declined. The principal exports are rice, teak, cotton, spices, and skins. Rangoon is the chief port of importation for the trade of Upper Burma and Yunnan. The city has few noteworthy buildings or monuments, but near by is the Shway-Dagon Pagoda, a massive and imposing structure, with a tower 321 feet high capped by an enormous gilded crown and containing a bell weighing 30 tons. The pagoda is the repository of eight hairs from the head of Gautama Buddha, and is a favorite object of pilgrimage and seat of an annual fair.

Rangoon was in 1753 selected by Alompra as capital of Pegu, and given its present name *Ran-kun*, or "end of the war." Before that it was named after the pagoda, which was built, according to tradition, about 585 B. C. The city was occupied by the British in 1821, but soon returned to the Burmese. It was again taken in 1852, and has since been held by the British. It has prospered under their rule, and the population increased from 25,000 in 1852 to 180,324 in 1891. The city forms a separate administrative district of 22 sq. miles. The population is chiefly Buddhist.

MARK W. HARRINGTON.

**Rangpur:** district of Bengal, British India; between 25° 16' and 26° 21' N., and bounded E. by the Brahmaputra. Area, 3,486 sq. miles. Pop. 2,100,000. The surface is very low, and in the wet season entirely inundated. Cotton does not succeed. Indigo is the principal product; fifty large factories are in operation, M. W. H.

**Ran'idæ** [Mod. Lat., deriv. of Lat. *ra'na*, frog]: the family of anurous batrachians which contains the true frogs.

**Ranke, Johannes, M. D., Ph. D.:** physiologist and anthropologist; b. at Thurnau, Bavaria, Aug. 23, 1836; studied at the Universities of Munich, Tübingen, Berlin, and

Paris, graduating M. D. in 1861 at the first named, from which he received Ph. D. in 1882. He was appointed Extraordinary Professor of Physiology in the University of Munich in 1869. He was the co-editor of the *Beiträge zur Anthropologie und Urgeschichte Bayerns* (1877); and has been editor of the *Archiv für Anthropologie* since 1882. His principal work is *Grundzüge der Physiologie des Menschen*.

S. T. ARMSTRONG.

**Ranke, Leopold, von:** historian; b. at Wiehe, Thuringia, Dec. 21, 1795; studied at Halle and Berlin; was appointed teacher at the gymnasium of Frankfort-on-the-Oder in 1818, and Professor of History at the University of Berlin in 1825. His principal writings are *Geschichte der romanischen und germanischen Völker von 1494-1535* (1824); *Fürsten und Völker von Südeuropa im 16. und 17. Jahrhundert* (1827); *Die serbische Revolution* (1829), one of his most brilliant productions; *Ueber die Verschwörung gegen Venedig im Jahre 1683* (1831); *The Popes of Rome, their Church and State* (3 vols., 1834-37; translated into English by Mrs. Austin in 1840, by Scott in 1846, and by E. Foster in 1848); *History of Germany in the Time of the Reformation* (6 vols., 1839-47; translated into English by Mrs. Austin); *Memoirs of the House of Brandenburg, and History of Prussia during the Seventeenth and Eighteenth Centuries* (3 vols., 1847-48; translated into English by Sir A. Duff Gordon); *Jahrbücher des deutschen Reichs unter dem sächsischen Hause* (3 vols., 1837-40); *Französische Geschichte vornehmlich im 16. und 17. Jahrhundert* (5 vols., 1852-55); *A History of England principally in the Seventeenth Century* (6 vols., 1859-68; English translation 1875); *Geschichte Wallensteins* (1869); *Weltgeschichte* (1881-88). The complete edition of his works comprises forty-seven volumes. His very first productions immediately attracted great attention, both on account of the high merit of their style and composition, and on account of the ingenuity evinced in gathering and sifting the materials. It is also to this latter point that the expression "the school of Ranke" principally refers—to the method of studying history rather than to the method of writing it. D. in Berlin, Germany, May 23, 1886.

**Rankine, William John Macquorn:** physicist and engineer; b. in Edinburgh, Scotland, July 5, 1820. In his early education his father, a retired lieutenant of the rifle brigade, was his chief instructor. He early displayed fondness for the natural sciences, and was fortunate in having the eminent Prof. J. D. Forbes as his tutor in natural philosophy. To him he dedicated his earliest and a somewhat remarkable paper, advocating the use of cylindrical wheels for railway carriages. Civil engineering naturally attracted his attention, and from 1841 to 1851 he was employed on the railways of Scotland. One of the most noticeable of his physico-mathematical researches was based on an hypothesis of "molecular vortices," by which was deduced the laws of elasticity, and of heat as connected therewith; from this he took at once prominent rank as an original investigator. His theoretical results, conforming closely to those subsequently obtained experimentally by Regnault and Dr. Ure, were in their ultimate form published in *The Philosophical Magazine*, Dec., 1851 (*On the Centrifugal Theory of Elasticity as applied to Gases and Vapors*). Important papers on kindred subjects succeeded this, among which are *On the General Law of the Transformation of Energy* and *On the Lines of the Science of Energetics*. In 1855 Rankine became Regius Professor of Civil Engineering and Mechanics in the University of Glasgow. Soon after taking the chair he turned his attention to the production of a series of manuals for engineering students and practical men. D. in Glasgow, Dec. 24, 1872.

**Ransom, Matthew Whitaker:** U. S. Senator; b. in Warren co., N. C., Oct. 8, 1826; graduated at the University of North Carolina 1847; admitted to the bar in the same year; became a planter and politician; attorney-general of North Carolina 1852-55; member of the Legislature 1858-60; peace commissioner to the Montgomery convention 1861; entered the Confederate service as lieutenant-colonel; rose to be major-general, serving through the war; surrendered at Appomattox Court-house; elected as a Democrat in Jan., 1872, to the U. S. Senate for the term expiring in 1877; re-elected for 1877-83, 1883-89, and 1889-95.

**Ransom, Robert:** officer; b. in North Carolina, Feb., 1829; graduated at the Military Academy, and promoted brevet second lieutenant of First Dragoons July 1, 1850; became captain First Cavalry Jan., 1861, resigned May 24, 1861, and

**Raphides**: See RHAPHIDES.

**Rapidan' River**: a stream of Virginia which rises by several head-streams at the base of the Blue Ridge, and flows between Green and Orange Counties on its right, and Madison and Culpeper on its left. Ten miles above Fredericksburg it joins the Rappahannock, after a course of about 80 miles.

**Rapid City**: city; capital of Pennington co., S. D.; on the Rapid river and the Fremont, Elkhorn, and Mo. Valley Railroad; 45 miles S. E. of Deadwood, about 140 miles W. by S. of Pierre (for location, see map of South Dakota, ref. 7-B). It is in the famous Black Hills; is the seat of the State School of Mines, created by act of the territorial legislature in 1885; and contains 2 national banks with combined capital of \$125,000, a State bank with capital of \$50,000, and a daily and 5 weekly newspapers. Pop. (1880) 292; (1890) 2,128.

**Rapid-fire Guns**: See MACHINE AND RAPID-FIRE GUNS.

**Rapp, GEORGE**: founder of the sect of HARMONISTS (q. v.); b. at Iptingen, Württemberg, Germany, Oct., 1770; founded in early manhood a communistic religious association to restore the practices of the primitive Christian Church; came into conflict with the authorities; emigrated to the U. S. in 1808 with a number of his associates; founded the town of Harmony, Butler co., Pa., and later the town of Economy, now Harmony, in Beaver co. D. at Economy Aug. 7, 1847.

**Rappahannock River**: a stream which rises in the foothills of the Blue Ridge, near the northwest border of Fauquier co., Va., and flows southeast, generally parallel to the Potomac, reaching Chesapeake Bay through a broad estuary. Its largest branch is the Rapidan. At its rapids at Fredericksburg a fine dam affords extensive water-power. Below Fredericksburg it is a noble tidal stream, the navigation of which is important. It is about 250 miles in total length.

**Raptores**, sometimes **Raptatores** [Mod. Lat. pl., from Lat. *raptor*, a robber]: a group, or order, of birds containing the birds of prey, comprising the hawks (*Falconidae*), owls (*Strigidae*), secretary-bird (*Gypogeranidae*), and American vultures (*Cathartidae*). These last differ from the others in many important particulars, and should, very likely, be placed apart. The *Raptores* are birds of powerful flight, characterized by a hooked, cere beak, and, with few exceptions, powerful feet and sharp, curved claws. The palate is desmognathous, there are two carotids, the oil-gland is present, as are also caeca, except in *Cathartidae*. The female is generally larger than the male; the young are helpless when hatched. There are about 500 species, distributed throughout the world. *ACCIPITRES* (q. v.) is by many authors restricted to the hawks or diurnal birds of prey. F. A. LUCAS.

**Raritan River**: a river in New Jersey, which rises in two branches in Morris co., flows S. E. through Somerset and Hunterdon Counties, and falls into Raritan Bay at Perth Amboy. It is navigable as far as New Brunswick.

**Raschid**: See HAROUN AL RASCHID.

**Rash**: a popular name for the acute exanthematous or eruptive diseases, or more frequently for the eruption itself which attends such diseases. Nettle-rash or urticaria, scarlet rash (roseola), and canker-rash (scarlet fever) are the diseases generally called by this name, which, though convenient for nursery use, is of no scientific value.

**Rashi** [a combination of the initial letters of his title and name]: the celebrated Jewish commentator Rabbi Solomon Ben Isaac; b. at Troves, in Champagne, France, in 1040. Little is known about his life, except that he studied at the theological schools of Mayence and Worms. He died July 13, 1105. He wrote commentaries on all the books of the Bible except Chronicles; which, though they contain much of the traditional rabbinic exegesis, seek to determine the simple meaning (*Peshat*) of the text. They have been held in the highest esteem not only by Jewish writers, but also by Nicolaus de Lyra, Luther, Sebastian Münster, etc. His commentary on the Pentateuch was the first Hebrew book printed (1475). He also wrote a commentary on twenty-three of the treatises of the Babylonian Talmud, which is printed in every edition of that work. Among his other writings may be mentioned a commentary to *Bereshith Rabba*; *Happard's*, containing decisions on ritual and legal matters; and a few hymns. In his commentaries Rashi cites a large number of Provençal words which have been collected by Arsène Darmesteter, and which are of value in determining the pronunciation of the particular dialect used by the Jews in that part of Provence. See ZUNZ, *Zeitschrift*

*für die Wissensch. des Judenthums* (Berlin, 1822, iii., p. 277); Graetz, *History of the Jews* (Philadelphia, 1894, p. 286); Siegfried, *Raschi's Einfluss auf Nicolaus von Lira und Luther* (in Merx, *Archiv*, i., p. 428); Maschkowski, *Raschi's Einfluss auf Nikolaus von Lyra* (in *Zeitschrift für alttest. Wissenschaft*, xi., p. 268); Clément-Mullet, *Documents pour servir à l'histoire de Raschi* (Troyes, 1855); Arsène Darmesteter, *Glosses et Glossaires Hébreux-Français du Moyen Âge* (in *Romania*, i., pp. 146, seq.).

RICHARD GOTTHEIL.

**Rask, RASMUS KRISTIAN**: scholar; b. at Brøndekilde, on the island of Fünen, Denmark, Nov. 22, 1787; studied at the University of Copenhagen. In 1808 he published his *Introduction to the Study of the Icelandic Language*, which, with his edition of the *Eddas* (1818), the first critical and complete one published, forms the foundation for the study of Icelandic literature and language. In 1818 he began his extensive travels. He spent first two years in Iceland, the result of which was his celebrated *Researches concerning the Origin of the Icelandic Language* (1818), which received the gold medal of the Danish Scientific Society, and in which the first observations of the transpositions of sounds in the Teutonic languages were published. He next spent two years in Stockholm, where he published a grammar of the Anglo-Saxon language (1817), translated into English by B. Thorpe (1830), and studied Finnish, and then, in 1817, he proceeded by St. Petersburg, where he remained over a year, studying the Slavonic dialects, to Astrakhan, through Persia, and to India, which he traversed in its whole length from 1820 to 1822, returning home, by Ceylon, in 1823. He brought to Copenhagen a great number of rare Oriental manuscripts, one of the greatest treasures of the Royal Library; but incomparably greater was his working knowledge of most of the languages composing the Indo-European family, from the English to the Manchchu. But his health was broken, and the results of his enormous linguistic acquisitions were fragmentary. He wrote essays on the Zend language, the genuineness of the *Zend-Avesta*, the ancient Egyptian and Hebrew chronology, and published grammars of the Spanish (1824), Frisian (1825), Italian (1827), and English (1832) languages. His richest and most original work is his *Introduction to a Scientific Orthography of the Danish Language* (1826), in which he gave comparative philology a new and powerful impulse, and foreshadowed many ideas later established as truths. He undoubtedly anticipated Grimm in the discovery of the law of the permutation of consonants. D. in Copenhagen, Nov. 14, 1832. *Samlede Afhandlinger* (vols. iii., 1834-38). Revised by D. K. DODGE.

**Rasköl'niks** [from Russ. *raskolenik'*, schismatic, heretic]: members of the *Rasköl'*, or schism, which dates officially from the year 1666. During the long period of the Mongol yoke numerous errors crept into the ritual and liturgical books of the Russian Church. In the seventeenth century, during the reign of Alexis Mikhailovich, the patriarch Nikon introduced numerous reforms, which were met by great opposition. Nikon fell, but the council which deposed him in May, 1667, confirmed his reforms. From that time the schism in the Russian Church became established. The Rasköl'niks objected to the alterations in and the printing of the church-books, to the form of the cross, and to various other matters. Thence they took the name of *Starobryadtsy*, or Old Ritualists (from *stary*, old, and *obryad*, a rite); but, as they professed to be the preservers of old faith, as well as of old rites, they called themselves also *Starovertsy*, or Old Believers (from *vera*, faith). When Peter I. introduced his reforms into Russia the Rasköl waxed stronger, its old religious opposition being fortified by a political resistance to the census, to military conscription, to shaving, to giving up the national dress. Peter I. vainly endeavored to crush their opposition. Since his time their treatment has fluctuated. Peter III. was their avowed protector. Catherine II. treated them leniently for a time, granting them the official designation of *Edinovertsy*, or Like-Believers, and allowing them to retain their old ritual. After the insurrection of Pugachev, an outbreak of schismatic and rebellious fury, they met with less favor. Nicholas I. in vain tried severe measures. Toward the end of his reign advances were made to them by the Poles and the Russian socialists, but the only result was the installation in 1846, at Belokrinitsa in Bukovina, of a Rasköl'nik metropolitan, Ambrose, formerly Metropolitan of Bosnia. His successor, Cyril, visited Moscow in 1863, and there held

**Ratafi'a** [Fr.; Malay, *araq*, arrack + *tafa*, a spirit distilled from molasses]: a name given to a large class of liqueurs, or sweet alcoholic drinks strongly flavored with aromatics.

**Ratel**: any one of three carnivorous mammals of the family *Mustelidae* and genus *Mellivora*, found in Africa and India, and sometimes known from their habits as honey-badgers. The typical species, *M. ratel* or *capensis*, a native of South Africa, has a stout, badger-like body and short tail; its total length is about 3 feet. The back is iron-gray, with a white crown and streak down each side. The other species, *M. indica* and *M. leuconota*, differ only in size and amount of white in their pelage. F. A. L.

**Ratio** [= Lat. *ra'tio*, reckoning, account, calculation, relation, deriv. of *re'ri*, *ra'tus*, reckon, believe, think, judge]: the numerical measure of the relation which one quantity bears to another of the same kind. The only way in which two quantities can be compared is by division. The operation of dividing one quantity by another of the same kind consists in dividing the number of times that any assumed unit is contained in the former by the number of times the same unit is contained in the latter. The operation of finding a ratio is therefore purely numerical, and the resulting ratio is consequently an abstract number. If the terms of the ratio are commensurable, their ratio is *exact*; if the terms are incommensurable, the expression of their ratio by quotient of two abstract numbers is only *approximate*; but it is to be remarked that the approximation to the true value may be made to any desirable degree of exactness.

*Prime and ultimate ratios* were used by Newton as the method of analysis in his *Principia*. It is a simplification of the method of exhaustion as used by ancient geometers. To conceive an idea of this method, let us suppose two variable quantities whose values approach each other so that their ratio continually approaches *a*, and finally differs from *a* by less than any assignable quantity; then is *a* the ultimate ratio of the two quantities. Again, if two variable quantities simultaneously approach two other quantities, which on the same hypothesis remain constant, the ultimate ratio of the variable quantities is the same as that of the constant quantities. The ratios are called *prime* or *ultimate*, according as the ratio of the variable quantities is receding from or approaching to the ratio of the constant quantities. Revised by S. Newcomb.

**Rationalism** [from Lat. *rationalis*, rational, reasonable, deriv. of *ratio*, *ra'tionis*, reckoning, thinking, judgment, reason, deriv. of *re'ri*, *ra'tus*, reckon, think, judge]: that tendency in modern thought which claims for the unaided human reason the right of deciding in matters of faith. It asserts the prerogative of the intellect to be supreme arbiter in all departments of revealed truth. It requires certainty as the condition of its favor, and promptly rejects what does not come before it with all the exactness and clearness of a mathematical demonstration. Like naturalism, supernaturalism, and other terms expressive of the relation of reason and faith, the term rationalism was first used in its present sense by the philosopher Kant. The scene where rationalism has exerted its chief sway is Germany. The sources were various, not only embracing different countries, but likewise different departments of investigation. The deism of England, one of the most polished and powerful of all forms of free thought, was industriously propagated in Germany, where the works of Lord Herbert, Hobbes, Shaftesbury, Tindal, Woolston and Wollaston were circulated in the language of the people and read by wide circles. In Holland the philosophy of Descartes and Spinoza was very powerful, and its influence was very decided east of the Rhine, particularly in the universities of Germany. The pantheism of Spinoza was very attractive to many minds, and was regarded as a welcome relief from the cold and heartless banishment of God from his own creation. France, however, was the chief foreign country which contributed to the rise and sway of German rationalism. The influence of Voltaire and the Encyclopædists was very great, and Berlin became as much a home to these men as Paris had ever been. The domestic causes were, first of all, the philosophy of Leibnitz, popularized and simplified by Wolf at Halle University; the destructive theology of Semler; the influence of the skeptical court of Frederick the Great, with its French surroundings; the *Wolfenbüttel Fragments*, published by Lessing; and the *Universal German Library*, issued by Nicolai. Rationalism was in the ascendant in Germany from 1750 to 1800, but with the beginning of the new century it began to lose its hold upon the best minds. Schleiermacher was the

transitional theologian from the old rationalistic to the new evangelical faith of Protestant Germany. His *Discourses on Religion: Speeches to its Cultured Despisers* (Eng. trans. London, 1893) diverted public attention from the rationalistic criticism to the necessity of feeling and a sense of dependence on God. Jacobi was really the first to introduce the sense of dependence into the domain of religious philosophy, but Schleiermacher was the first to apply it to the man of general culture. Neander, the Church historian, was the first positive theologian of the so-called "mediatory" school. His historical works breathe a fervent and devout spirit, at the same time that they evince the profound scholarship of the original student. In 1835 a new impulse was given to rationalistic criticism by Strauss's *Life of Jesus* (n. e., Eng. trans. London, 1893)—a work proceeding directly from the Hegelian school. It advocated the mythical origin of the Gospels. This work was promptly replied to by Neander, Ullmann, Tholuck, and many other representatives of evangelical thought. The most recent phase of rationalistic thought is materialistic. The views of Büchner, Carl Vogt, Moleschott, and others have gained a wide influence. Evangelical theology is, however, in the ascendant again in most of the German universities. On the literature of rationalism compare Farrar, *Critical History of Free Thought* (Bampton lectures, 1863); Lecky, *History of the Rise and Influence of the Spirit of Rationalism in Europe* (2 vols., London, 1865); Hurst, *History of Rationalism* (New York, 1865; 9th ed., rev., 1875); Fisher, *Faith and Rationalism* (New York, 1879); Pfeiderer, *The Development of Theology in Germany since Kant* (London, 1890). J. F. HURST.

**Rat'isbon**, or **Regensburg**: town of Bavaria; on the right bank of the Danube, opposite the influx of the Regen; 82 miles by rail N. N. E. of Munich (see map of German Empire, ref. 6-F). It is surrounded with walls pierced by six gates, and has a Gothic cathedral begun in 1275, but not finished till the middle of the seventeenth century; a town-house, in which the imperial diet assembled from 1662 to 1806; a magnificent stone bridge over the Danube, 1,100 feet long, connecting the town with the suburb of Stadt-am-Hof; and a monument of Kepler, who was born here. Gold, silver, brass, iron, steel, earthen and porcelain ware, leather, tobacco, and glass are manufactured, and there is an active trade in wheat and salt. Originally a Celtic town (Radasbona), it was made a frontier fortress by the Romans. In 1245 it was made a free imperial city. It was stormed by both the French and the Austrians in 1809, and was ceded to Bavaria in 1810. Pop. (1890) 37,635.

**Rat'itæ** [Mod. Lat., liter., fem. plur. of Lat. *ra'titæ*, marked with a raft (sc. *a'væ*, birds), deriv. of *ra'tis*, raft]: an order or sub-order of birds, considered by many authorities as a sub-class, contrasting with all the other living forms of the class, and containing the ostriches, cassowaries, and kiwis. It is distinguished, according to Huxley, by the sternum being devoid of a crest, and ossifying only from lateral and paired centers, the parallelism or identity of the long axes of the adjacent parts of the scapula and coracoid, and the non-development of an acromial process to the scapula, and of a clavicular process to the coracoid; the vomer has a broad cleft; the hinder and posterior ends of the palatines and the anterior ones of the pterygoids are very imperfectly or not at all articulated with the basisphenoidal rostrum. It may be further added that in all the living representatives the feathers are characteristic, the barbs being disconnected. The group embraces the largest of birds, all of which are incapable of flight, and progress by running. The species, though comparatively few, represent several well-defined families—viz., *Struthionidae*, embracing the African ostriches; *Rheidae*, including the South American ostriches or nandus; *Casuaridae*, with the cassowaries and emus of the Papuan Archipelago, Australia, etc.; and *Apterygidae*, including the kiwis of New Zealand; the order was also well represented in former geological epochs, especially in New Zealand, by the gigantic *Dinornithidae*, which seem to have been destitute of true wings.

Revised by F. A. LUCAS.

**Raton**: town; Colfax co., N. M.; on the Atch., Topock and S. Fé Railroad; 111 miles N. by E. of Las Vegas (for location, see map of New Mexico, ref. 8-T). It is in a coal-mining region, and contains the machine-shops of the railway company, a national bank with capital of \$50,000, and three weekly newspapers. Pop. (1890) 1,255.

**Ratramnus**, also called **Bertramus** by an error of copyists: a learned monk of the famous abbey of Corbie, near

It continued part of the states of the Church (with the exception of intervals during 1797-1815) until it was incorporated in the kingdom of Italy in 1860.

No Italian city seems more apart from the currents of modern life. Ravenna is not so much a city as a museum. Here better than at Rome may be studied primitive Christian art from the fifth to the ninth century. In the Cathedral of Sant' Urso, partly of the fourth century but reconstructed in the eighteenth, are frescoes by Guido Reni; the original campanile still remains. Close by is the octagonal-domed baptistry of the fourth century, containing the famous fifth century mosaic, representing the baptism of our Saviour in the Jordan. Near the Church of San Francesco, built on the ruins of a temple of Neptune about 450, but completely modernized, is the mausoleum of DANTE ALIGHIERI (q. v.), who died at Ravenna in 1321. In SS. Nazario e Celso, erected (440) in the form of a Latin cross by Placidia, daughter of Theodosius the Great, are the sarcophagi of that empress (d. 450) and of Honorius I. and Constantius III. The round tower of St. Giovanni Battista was constructed in 438. Santo Spirito and Sta. Maria in Cosmedin, embellished with mosaics of the sixth century, were built by Theodoric for the Arian bishops. Sant' Apollinare Nuovo, erected by Theodoric about 500 as the Arian cathedral, is resplendent with mosaics, mostly of the sixth and ninth centuries. San Vitale (consecrated in 547), a work of Justinian, is a partial copy of St. Sophia in Constantinople. Its gorgeous mosaics, admirably preserved, give the whole New Testament story; especially interesting are those of Justinian and his suite, and of his empress Theodora and her retinue. In the Carthusian monastery is the library founded in 1714, with over 50,000 volumes and 700 MSS. Among the latter is an autograph MS. of Dante of the fourteenth century. Half a mile outside the Porta Serrata is the rotunda or mausoleum of Theodoric. The cupola, 36 feet in diameter, and weighing over 200 tons, is hollowed from a single block of stone. Also outside the walls is the imposing Sant' Apollinare in Classe, on the site of a temple of Apollo, dedicated in 549 and restored in 1779, a specimen of the purest early Christian art. Two miles from the city is La Colonna dei Francesi, the square pillar raised in 1557 to commemorate the battle of Ravenna (1512), in which Pope Julius II. was defeated by Gaston de Foix. S. of Ravenna toward Rimini extends the Pineta, the vastest and most ancient pine forest in Italy. It begins not far from Sant' Apollinare in Classe, on the site of the ancient harbor, and stretches 25 miles along the Adriatic, with a breadth of from 1 to 2 miles. Pop. (1881) of city, 18,571; of commune, 60,573.

E. A. GROSVENOR.

**Ravenna:** village (settled in 1799); capital of Portage co., O.; on the Penn., the Erie, and the Pitts. and W. railways; 16 miles E. N. E. of Akron, 38 miles S. E. of Cleveland (for location, see map of Ohio, ref. 8-1). It contains 6 churches, 3 large public schools, a Roman Catholic school, 2 national banks with combined capital of \$250,000, gas and electric light plants, water-works system owned by the village, and a semi-weekly and 2 weekly newspapers. The manufactories include glass-works, coach and harness factory, carbon-works, flour and planing-mills, foundry, machine-shop, novelty-works, large dyeing establishment, 2 brick and tile works, 2 shoe-factories, and basket, chair, sad-iron, and spoke and hub factories. Pop. (1880) 3,255; (1890) 3,417.

EDITOR OF "REPUBLICAN."

**Ravenscroft, JOHN STARK, D. D.:** bishop; b. near Blandford, Prince George co., Va., in 1772; taken to Scotland in infancy; received there a classical education; returned to Virginia 1788; studied at William and Mary College; admitted to the bar, but ultimately studied theology; took orders in the Episcopal Church 1817; a minister in Mecklenburg co., Va., 1817-23, and pastor of churches successively at Raleigh, N. C., and at Williamsburg, Va., when he became Bishop of North Carolina. D. at Raleigh, Mar. 5, 1830. Two volumes of his *Sermons* were edited by Dr. (afterward Bishop) J. M. Wainwright in 1830, preceded by a memoir. See biographical sketches in *American Church Review* and in Batterson's *Sketch-book of the American Episcopate*.

Revised by W. S. PERRY.

**Ravenstein, ERNEST GEORGE:** geographer and statistician; b. at Frankfort-on-the-Main, Germany, Dec. 30, 1834; son of an eminent local geographer and cartographer; educated chiefly in his native town; removed to London about 1852; held an appointment in the intelligence department of the War Office 1855-75; member of the coun-

cils of the Royal Geographical and Royal Statistical Societies; founded the German Gymnastic Society 1861, and for ten years was its president; has published *The Russians on the Amur* (London, 1861); *Geographie und Statistik des Britischen Reiches*, in Wappäus's *Handbuch der Geographie* (Leipzig, 1862); *London*, one of Meyer's *Handbooks for Travelers* (1872, subsequent editions); *Cyprus* (London, 1876); *The Laws of Migration* and other papers in *Transactions of the Royal Geographical and Statistical Societies: A Handbook of Gymnastics and Athletics* (London, 1864); also a map of Eastern Equatorial Africa (twenty-five sheets), published by the Royal Geographical Society (1882-83); a *Systematic Atlas* for private study and superior schools, fifty-two sheets (London, 1893); a topographical map of England and Wales (1893).

**Ravignan, rā'vén'yan', GUSTAVE XAVIER DELACROIX,** de; pulpit orator; b. at Bayonne, France, Dec. 2, 1795. He first studied and practiced law, but in 1822 entered the Jesuit seminary at Montrouge and was ordained priest in 1828. After some years of teaching his talent as orator revealed itself, and in 1836 he succeeded Père Lacordaire at Notre Dame, Paris, where he remained till 1848. He was also an ardent champion of the Jesuits in pamphlets, and active in charitable works and foundations. D. Feb. 26, 1858. See his *Life*, by Père de Pontlevy (2 vols., Paris, 1860; Eng. trans., New York, 1873). A. G. CANFIELD.

**Rawal Pindi:** a district of British India, in the Northern Punjab. It lies on the south slopes of the Western Himalayas; is noted for its fertility and salubrity; embraces 4,681 sq. miles, and since the extension of the railway has carried on considerable trade with Afghanistan (see map of North India, ref. 3-C). Pop. over 1,000,000. Its largest town is Rawal Pindi; pop. (1891) 73,460; best known in recent times for the great durbar held there (1885) by the Viceroy of India, in honor of the Amir of Afghanistan.

Revised by C. C. ADAMS.

**Rawdon-Hastings, FRANCIS, Marquis of Hastings:** soldier and statesman; b. in Ireland, Dec. 7, 1754; was educated at Oxford; entered the army 1771; was sent to America in 1773; was present at the battle of Bunker Hill; became aide-de-camp to Sir Henry Clinton; participated in the battles of Long Island and White Plains and the attacks upon Forts Washington and Clinton; soon afterward raised in New York a corps called the Volunteers of Ireland, of which he took command; distinguished himself at Monmouth; was made general and sent to the Southern States with re-enforcements for Cornwallis 1780; took a prominent part at the battle of Camden Aug. 16; remained in the Carolinas after Cornwallis's return northward; attacked and defeated Gen. Greene at Hobkirk's Hill Apr. 25, 1781; relieved Fort Ninety-six; fortified himself at Orangeburg; incurred much obloquy on account of the execution of Col. Isaac Hayne July 31; sailed for England Aug., 1781; was captured by a French cruiser and taken to Brest; was made Baron Rawdon and aide-de-camp to the king 1783; succeeded his father as Earl of Moira in 1793; was given command of a force of 10,000 men sent to the relief of the Duke of York in Flanders in 1794; was intrusted with the direction of the expedition to Quiberon in 1795; was made lord-lieutenant of Ireland in 1805; made an unsuccessful effort to form a cabinet on the assassination of Mr. Perceval in 1812; was honored with the order of the Garter and appointed Governor-General of British India in 1813; successfully conducted the Nepaul, Pindaree, and Mahratta wars; was created Marquis of Hastings in Dec., 1816; retired from the government of India after a successful administration of nearly ten years in 1823; and became Governor of Malta in 1824. D. on board the *Revenge* in the Bay of Baia, near Naples, Nov. 28, 1826.

**Rawlins:** city; capital of Carbon co., Wyo.; on the Union Pac. Railroad; 136 miles W. N. W. of Laramie, 710 miles W. of Omaha (for location, see map of Wyoming, ref. 11-1). It is in a mining and stock-raising region, has an elevation of 6,540 feet above sea-level, and contains a valuable sulphur spring, quarries of limestone and building-stone, a national bank with capital of \$75,000, and two weekly newspapers. The city has large trade, especially with Northwest Colorado. Pop. (1880) 1,451; (1890) 2,235.

**Rawlins, JOHN AARON:** soldier; b. at East Galena, Ill., Feb. 13, 1831; the son of a farmer and charcoal-burner. He had but limited opportunities for obtaining an education, and at the age of twenty he began to attend school; in Nov., 1854, began the study of law, and in 1855 was a. l.

special attention to promoting legislation for the improvement of the school and canal systems; retired from *The Courier and Enquirer* 1850; on Sept. 18, 1851, issued the first number of *The New York Times*. Raymond took an active part in the Baltimore Whig convention of 1852; elected lieutenant-governor of New York 1854; prominent in the organization of the Republican party 1856, having been the author of the *Address to the People* issued by the Pittsburg convention; warmly urged Seward for the presidential nomination 1860, but gave efficient support to Lincoln when nominated and during his administration, though often differing from him on questions of war-policy; elected a member and Speaker of the New York Assembly 1861; presided over the Union convention at Syracuse 1862; defeated by Gov. Morgan in his candidacy for the U. S. Senate 1863; chairman of the New York delegation in the national Republican convention 1864; elected to Congress in 1864, but separated from the majority of his party in that body by giving a partial support to the policy of Johnson; took part in convoking the Philadelphia "Loyalists' convention" of 1866, and wrote its *Address and Declaration of Principles*; refused to be a candidate for re-election to Congress 1866; declined the mission to Austria offered him by President Johnson 1867. D. in New York, June 18, 1869. He published a *History of the Administration of President Lincoln* (New York, 1864), which in a revised edition was entitled *The Life and Public Services of Abraham Lincoln* (1865), and a few other works.

**Raymond, JOHN T.** (original name, *John O'Brien*): actor; b. in Buffalo, N. Y., Apr. 5, 1836. He was educated in the common schools; made his first appearance at the Rochester (N. Y.) theater as Lopez in *The Honeymoon*; afterward appeared at Charleston, S. C., as Asa Trenchard in *Our American Cousin*, with Edward Sothern as Lord Dundreary. On July 1, 1867, he played with Sothern the same character in the same piece at the Haymarket theater, London, and afterward made a tour of the British provinces. He returned to the U. S. in the autumn of 1868, and appeared in New York as Toby Twinkle in *All that Glitters is not Gold*. His artistic triumph was achieved in 1874, when he brought out at the Park theater, New York, *The Tilded Age*, founded on Mark Twain's novel. As Col. Mulberry Sellers, he acted with much humor and originality. The piece did not prove popular in England. He appeared on the stage for the last time in Hopkinsville, Ky. D. at Evansville, Ind., Apr. 10, 1887. B. B. VALLENTINE.

**Raymond, MINER, D. D., LL. D.**: minister and educator; b. in New York, Aug. 29, 1811; spent childhood and youth in Rensselaerville, N. Y.; studied 1830-34, and taught 1834-41 at Wilbraham Academy, Mass.; joined the New England conference of the Methodist Episcopal Church 1838. He was principal of Wilbraham Academy from 1848 to 1864, then became Professor of Systematic Theology in the Garrett Biblical Institute at Evanston, Ill.; published *Systematic Theology* (3 vols., 1877-79). Revised by A. OSBORN.

**Raymund Lully**: See LULI, RAIMON.

**Raynal, rā'naal', GUILLAUME THOMAS FRANÇOIS**: historian; b. at St.-Geniez, department of Aveyron, France, Apr. 12, 1713; studied theology at the college of the Jesuits at Toulouse; entered their order and began to preach, but went in 1747 to Paris, and, enjoying the company of Diderot, Holbach, Helvetius, etc., he entered on an entirely opposite course. Of his numerous historical works, *Histoire du Divorce de Henri VIII. avec Catherine* (1763) attracted some attention, and his *Histoire philosophique et politique des Établissements et du Commerce des Européens dans les Deux-Indes* (first published anonymously in 4 vols., 1770, then in an enlarged edition under his name, 5 vols., 1780) was condemned by the parliament of Paris, and a warrant of arrest issued against the author. He fled to Switzerland, lived subsequently at the court of Frederick II., but was allowed to return to France in 1788; received several marks of distinction from the authorities. D. at Chaillot, near Paris, Mar. 6, 1766. He also wrote *Tableau et Révolutions des Colonies anglaises dans l'Amérique septentrionale* (2 vols., 1781), which was translated into English, and sharply criticised by Thomas Paine.

**Raynouard, rā'noo'ar', FRANÇOIS JUSTE MARIE**: poet and philologist; b. at Brignolles, Provence, France, Sept. 18, 1761. He was bred a lawyer, elected to the Legislative Assembly in 1791, and was a deputy in 1806 and 1811. His poem, *Socrate dans le temple d'Aglaure* (1803), and his trage-

dies, *Calon d'Utique* (1794), *Les Templiers* (1805), and *Les États de Blois* (1814), gave him a literary reputation, and he was chosen to the Academy in 1807. He is best remembered as a philologist. He did much to revive the interest in the older literature of France, and contributed to a better knowledge of the Provençal language by his important works, *Choix de Poésies originales des Troubadours* (6 vols., 1816-21); *Lexique roman, ou Dictionnaire de la Langue des Troubadours* (6 vols., 1838-44); *Grammaire romane* (1816); *Recherches sur l'ancienneté de la langue romane* (1816). D. at Passy, Paris, Oct. 27, 1836. A. G. CANFIELD.

**Razor-clam**: the common name of various bivalves of the genus *Solen*, given in allusion to the shape of the shell.

**Razzionere, PABLO DE**: See C'ESPEDES.

**Ré, rā**: an island of France, department of Charente-Inférieure; in the Bay of Biscay, in front of the harbor of La Rochelle. It is 18 miles long, 4 miles broad, treeless, with steep coasts; is strongly fortified, and has about 15,000 inhabitants, who are mostly employed in fisheries, oyster-farming, wine-cultivation, and the manufacture of salt.

**Read, GEORGE**: jurist; b. in Cecil co., Md., Sept. 18, 1733; became a lawyer at Newcastle, Del., 1754; attorney-general of Delaware and member of the Delaware Legislature for many years; a member of the Continental Congress 1774-77, and one of the signers of the Declaration of Independence; president of the constitutional convention of Delaware 1776; member of the convention that framed the Federal Constitution; appointed judge of appeals 1782; U. S. Senator 1789-93; and chief justice of Delaware from 1793 to his death, at Newcastle, Sept. 21, 1798.

**Read, JOHN MEREDITH, JR.**: diplomatist; b. in Philadelphia, Pa., Feb. 21, 1837; graduated at Brown University 1854, and at the Albany law school 1859; adjutant-general of New York during the civil war; published *An Historical Inquiry concerning Hendrick Hudson* (1866); wrote much for periodicals; appointed consul-general at Paris in 1868; also acted as consul-general of Germany during the Franco-German war, and afterward for nearly two years directed all the consular affairs of that empire, including the protection of German subjects and interests during the first and second sieges of Paris; appointed U. S. minister to Greece in 1873, but returned in 1879, the office having been abolished by Congress. He was president of the Social Science Congress at Albany, N. Y., in 1868, and vice-president of the one at Plymouth, England, in 1872. Revised by JAMES MERCUR.

**Read, THOMAS BUCHANAN**: poet and painter; b. in Chester co., Pa., Mar. 12, 1822; studied sculpture at Cincinnati, but soon turned his attention to painting, which he practiced at New York (1841), and soon afterward at Boston; removed to Philadelphia 1846; went to Florence, Italy, in 1850, and resided there with few intermissions until 1872, when he returned to the U. S. D. in New York, May 11, 1872. Author of *Poems* (1847); *The New Pastoral* (1855); *The Wagoner of the Alleghanies* (1862); and *A Summer Story, Sheridan's Ride and Other Poems* (1867). Among his paintings are the well-known portraits of Mrs. Browning and of Longfellow's children; the portraits illustrating his compilation, *Female Poets of America* (1848); and the painting illustrating his *Sheridan's Ride*.

Revised by H. A. BEERS.

**Reade, CHARLES**: novelist; b. at Ipsden, Oxfordshire, England, in 1814; educated at Magdalen College, Oxford, and graduated 1835; was elected to a Vinerian fellowship at Oxford 1842; was called to the bar at Lincoln's Inn 1843; published in 1852 *Peg Woffington*, a novel which gave him an immediate reputation, and afterward issued many novels and tales, among which are *Christie Johnstone* (1853); *Never Too Late to Mend* (1856); *Love me Little, Love me Long* (1859); *The Cloister and the Hearth* (1861); *Hard Cash* (1863); *Griffith Gaunt* (1866); *Put Yourself in his Place* (1870); *A Terrible Temptation* (1871); *A Woman Hater* (1878); and *The Jilt and Other Tales* (1884). Reade displayed great skill in plot and incident, had a picturesque style, and often wrote with a social or political object in view. Most of his novels were successfully dramatized by himself or by Boucicault, and he wrote several independent plays. He gained some note from his lawsuits on questions connected with the rights of authors and the limits of permissible literary criticism, and from his vigorous advocacy of international copyright with the U. S. D. at Shepherd's Bush, London, Apr. 11, 1884. Revised by H. A. BEERS.

another, its successor. Hence each individual thing is only a momentary phase of some process which has many potentialities; these potentialities it realizes in the series of individual things, each thing realizing some of them. Thus the process, as embracing the rise and dissolution of many individuals, is generic or a universal; it possesses the potentiality of each thing, and at the same time possesses the reality of each; the reality of each thing is the reality of the universal process which causes it. Inasmuch as it—the process—annuls individual things, and likewise originates them, it includes in itself the total of reality, and is therefore real in a more complete sense than any individual thing. Again, it must be noted that what we call individual things are arbitrarily limited phases of processes. Each individual, so called, is identified by nominalism with only a portion of its history, as it were, for it can be traced by degrees back into another thing, in which it originated, and forward into another, in which it finally disappears. Moreover, it is correlated in space with other things, and it is arbitrary in the Nominalist to assume that he has an individual thing before him when he has only a dependent part of the whole process of interrelated things. Thus the word process, to which natural science in our day has arrived (Darwinism teaching that things are to be studied in their history and development, evolution and the correlation of forces being doctrines of the supreme reality of universals in the shape of a law or persistent force), interprets realism, and reinstates it as a more advanced stage of thinking than nominalism. Realism may be (a) psychological, holding in regard to artificial things—e. g. table or chair—that the general notion or name conventionally signifies the purpose or design which creates such things, and therefore corresponds to what reality they possess; (b) natural, a realism which recognizes the natural objective processes in nature and mind. Mind is considered immortal as individual (not as a thing), for the reason that it is a total process within one reality; each thinking being has potentially in his mind the universal reason, and is able to realize the same by his own activity. In thus realizing his possibilities by culture and education he does not annul his individuality (as the process of forces annuls things), but rather intensifies his consciousness of self, and deepens his subjectivity by the same act in which he realizes his universality. This doctrine is expressed by Aristotle's "entelechies." First entelechy (self-contained being)—"End-in-itself"—entire process in one reality) has all the possibilities and the power to develop them, but has not energized as yet (the man as infant or savage); second entelechy has developed its potentialities through self-activity (the man as cultured, civilized, and enlightened).—Realism, as contrasted with idealism in the school of common sense, is the theory that we cognize external objects by direct perception instead of by means of interposed ideas.

WILLIAM T. HARRIS.

**Realism in Fine Art:** the art or practice of expressing the real in contradistinction to the imagined, the ideal, or the traditional. Thus, in the choice of subject, the representation of a glory of angels may be called imaginative or imaginary. The frieze of the Parthenon is a strongly idealized treatment of a procession, very abstract indeed, and not at all a complete statement of the facts. The picture of a saint with his or her attributes is generally very traditional. In opposition to these, realism would choose religious enthusiasm seen among living and humble people, or a faithful portrait of a military or civic parade, or a sailor risking his life in the way of duty. That is to say, the realist paints what he has seen and known, and whatever ideas of dignity or humility he may wish to convey will be given to the common scenes and the actual persons of his own experience. Apart from the choice of subject, realism chooses a manner of representing men and things which will give them nearly as they are to ordinary human observation. A realistic study of slaves or poverty-stricken peasantry would insist on their dull and fatigued expression, their stooping and often malformed bodies, and their hard and hopeless toil. The same subject, the same scene and incident, might be treated so as to insist upon the close communion with nature, the healthful out-of-door life, the strength of body of both men and women. Also, to come still further away from the mere choice of subject, the peasants or the slaves in the realistic picture will be shown ugly because of monotonous work and poor food, ill-clothed and dirty, unpleasant and even repulsive to look at. The same men and

women may be invested with beauty of form and color, and may be so painted and so grouped as to give a very beautiful resulting composition, without obvious and admitted falsehood.

Realism in art is generally assumed to be a debasing theory and practice. The term is more often used in reproach, and applied to artists whose work is not approved. In this there is a constant though unconscious reference to the French term *réalisme*, which is commonly used in this evil sense. Some years ago a photograph from a drawing by Couture was handed about the studios; it represented a student of art seated on a cast of the head of an Apollo and drawing carefully from the head of a large hog, while cabbages and old boots lay about as further models for study. The title written below was *Un Réaliste*, and the idea was, of course, that realism turned away from the highest beauty to see truth in the ugly, or at least the indifferent; but this again is a mere satire of assumed vulgarity in choice of subject; and no one would have been quicker than Thomas Couture to state that choice of subject has little to do with fine art, and that it would be better to treat a group of swine ideally than a group of men of heroic stature and beauty realistically. In all the French horror of *le réalisme* there is the assumption that it is in some way opposed to *l'idéal*; that is to say, that realism is the antagonist of idealism. As all artists are in pursuit of the ideal in one form or another, this antagonism can hardly exist to the degree supposed. Rembrandt in his etchings was a realist as to the figures of men and women; he took them as he saw them, ill-grown, ill-nourished, clothed in hideous garments; but in light and shade and the composition of light and shade he was an idealist in the highest sense. The student who compares the *Adam and Eve* of Rembrandt with a photograph or a cast from the Parthenon frieze is free to say, as he is apt to feel, that the one is vulgar realism and the other is noble idealism; but a further consideration brings with it the sense that one is as idealistic as the other—it is only a question what the ideal is.

Again, a landscape painting may show the rocky structure of two low hills on the Newport coast, and the thin bed of morass which fills the hollow between them. It is perfectly traceable how the hills are built up and how they are wearing away; and the bit of swamp which separates them is as obviously there merely because the rock is impervious to water, and holds vegetable mould and pulverized rock together in a soft, spongy, saturated mass, as if we could sound it and take up a shovelful for examination. This treatment of the natural facts with a strong insistence on their true character is certainly realistic; but the means taken to show it are probably very idealistic, probably so because it is unlikely that the whole story would be as clear to the eye of the observer at any one point of the natural landscape as it is made to the student of the picture. The picture as a piece of coloring and line composition is an ideal work, of course, but it will be ideal also in the matter of this insistence on a high and important truth, which truth could only be shown in its fullness by a very decided abandonment of mere copying.

The conclusion is that in fine art there is none of that clear distinction between realism and idealism that is maintained in metaphysics. Idealism is merely the higher realism, the realism of very intelligent and clear-seeing men.

RUSSELL STURGIS.

**Reality:** the fundamental truth, underlying all things. See METAPHYSICS.

**Real Presence** (sc. of Christ in the Eucharist). **The Doctrine of the:** part of the professed belief of the Roman Catholic, Greek Catholic, and other ancient Churches. According to it "Christ is contained whole and entire under either species—i. e. that his body, blood, soul, and divinity are given both under the form of bread and under that of wine" (*Addis and Arnold*). In the Anglican Church the real presence is maintained, but so defined as to avoid the imputation of being a belief in the corporal presence—i. e. in "the presence in the holy sacrament of the Lord's Supper of the body and blood of Christ in a corporeal or materially substantive manner" (*Hook*). On the contrary, the real presence is not "to be sought for in the sacrament, but in the worthy receiver of the sacrament" (*Hooker*); but as, "with the natural bread in the sacrament, there is present the spiritual bread which is Christ's body," it is none the less real. See EUCHARIST and TRANSUBSTANTIATION.

SAMUEL MACAULEY JACKSON.

eral use. Several forms of rake, as Wood's chain-rake and Miller's table-rake, have been introduced into the U. S. and other countries. C. W. and W. W. Marsh invented and patented a machine in 1858 in which the cut grain was re-

FIG. 7.—Harvester.

ceived on an endless apron and carried thereby to another apron, which elevated the grain to a stand on the machine, where two men, while riding along, bound it into bundles. This machine (Fig. 7) considerably advanced the art of cutting grain. The automatic wire self-binder, marking a progressive step in harvesting machinery, followed the Marsh harvester. The wire bands proved to be objectionable in both wheat and straw. Magnets were required in the mills to remove the pieces of wire from the wheat, and cattle were injured by the wire when eating the straw. Marquis L. Gorham invented a cord-binding attachment which, with various improvements by J. F. Appleby, has been generally adopted by the manufacturers of binders, with one or two notable exceptions. All self-binding machines are now so perfected that they give universal satisfaction. In all this class of machines the grain is delivered by the elevating aprons upon a slanting table, where iron packers work continuously through slots in the table and rake the grain down to the knottor and upon a trip-finger, which automatically sets the knottor in motion when enough grain has accumulated for a bundle. The knot is tied in the cord by a single revolution of a bill-shaped hook with a hinged tongue that is moved by a cam. The self-binder (Fig. 8) has rapidly replaced the self-rake reaper (Fig. 9). Briggs and Carpenter, Feb., 1836, secured patents for a heading-machine; since then over 100 have been granted on these machines, which have proved to be well adapted to cutting large harvests in dry climates. The essential parts are a cutting device from 16 to 20 feet long, mounted upon wheels, a reel, an endless horizontal apron, which carries the severed heads to a second apron, extending 4 to 6 feet at an upward angle, whereby the heads are deposited in a large wagon-box, the side next to the header being low, the opposite side high.

FIG. 8.—New Osborne harvester and binder (the self-binder).

A large, long tongue extends to the rear, supported by a truck, and with wheel-steering device similar to that used

on steamboats. Four horses abreast, attached to the tongue near the trucks, push the machine. The cutting device is that shown in Fig. 10. Six men and ten horses are able to cut and stack the grain from 15 to 30 acres daily. The com-

FIG. 9.—A modern self-rake reaper.

bined harvester (Fig. 10) unites the header, the thresher and separator, the fanning-mill, the sacker, and straw-carrier in one machine. The large machines are propelled either by traction-engine or by thirty to thirty-six horses. If steam power is used, seven men are required; if horse-power, four. Of the combined harvesters 10 per cent. are steam-power, 90 per cent. horse-power. Either will cut from 60 to 125 ac-

FIG. 10.—Combined harvester (shown as at work in the field).

and thresh from 1,700 to 3,000 bush. daily. The average life of one of these harvesters is about eight years if used for fifty days each season. From the grain-cradle to the steam-harvester is a long way, yet the larger part of the harvests of the world is secured by the aid of the former or implements still more primitive.

The corn-harvester (Fig. 11) is the greatest improvement in the late inventions of harvesting machinery. It is the binder modified, strengthened, and adapted to the heaviest and most difficult work—that of cutting, elevating, and binding corn 8 to 14 feet high, weighing from 15 to 25 tons per acre.

Simultaneously with the reaper came the mowing-machine. At first it was practically the reaper dismantled of its platform and other parts not needed for cutting grass.

As it required a higher speed to cut grass than grain, no satisfactory combine mower was made until a device was invented for changing the knives from low to a high speed. Separate machines for mowing are now the rule; they are without reels or platforms. The cutter-bar is hinged at the inner end to allow to follow the inclinations of the ground. Levers are provided for elevating or depressing the cutter-bar and for controlling the dip or angle of the guards and knives. Cyrenus Wheeler produced a successful mower in 1853, which was soon followed by the Buckeye and others, which were modifications of Husey's and Wheeler's machines. Rear-end machines were most common prior to 1880; since that time front-cutting machines have come into general use (Fig. 12). In 1870 Rudolph Eichemeyer's oscillating gear mower converted, by means of cams in the main wheels, their rotary motion into reciprocating motion required by the knife, thus obviating the necessity of gear-wheels.

*política*; a version of the book of Job, called *La constancia victoriosa*, and one of Jeremiah, *Trenos de Jeremías* (both Cologne, 1855). He wrote also a poetical version of the Psalms, a life of Christ in verse, and several ballads and epigrams. D. in Madrid in 1876. His works were printed in three volumes, at Madrid, in 1778. A. R. MARSH.

**Récamier**, rā'kää'mi-ä', JEANNE FRANÇOISE JULIE ADELAIDE BERNARD, Madame: b. at Lyons, France, Dec. 4, 1777; a woman of great charm of person and mind, she married in 1798 Jacques Récamier, a Paris banker, three times her age, and made her house the gathering-place of a group of brilliant personages, among whom Chateaubriand and Ballanche were conspicuous. The reactionary political and religious ideas there current made her the object of Napoleon's displeasure, and in 1811 she was ordered to leave Paris. At the restoration she returned to Paris and established herself modestly in the old Abbaye-aux-Bois, where she again became the center of a brilliant intellectual circle. Her beauty and intelligence gained her many worshippers and suitors, among whom Chateaubriand and Prince August of Prussia are famous. D. May 11, 1849. See Madame Lenormant, *Souvenirs et correspondance tirés des papiers de Madame Récamier* (2 vols., Paris, 1860), and *Madame Récamier, les amis de sa jeunesse* (Paris, 1872), both translated into English by Isaphene M. Luyster (Boston, 1867 and 1879); also Chateaubriand, *Mémoires d'Outre Tombe*, vols. viii.-x. A. G. CANFIELD.

**Recanati**, rā-kää-naa'tē: town; in the province of Macerata, Italy; on a hill about 900 feet above the sea; 15 miles S. of Ancona (see map of Italy, ref. 4-E). The adjoining country is very productive, the grapes and figs being of the finest quality. The town has a Gothic cathedral dating from the fourteenth century. The Palazzo Comunale has on its façade a bronze representation of the translation of the Holy House to LORETO (q. v.). Leopardi was born here, and his monument adorns the principal piazza. Recanati was sacked by the French in 1799. Pop. 5,824. Porto Recanati, 6 miles N. E. on the coast, has 3,040 inhabitants.

**Recapture**: in international law, the recovery of a captured vessel by a cruiser of the same nation or of an ally. If retaken before any sentence of a prize-court of the captor's sovereign has decided upon the validity of the capture, and thus determined the ownership of the captured vessel, it goes to the owner; after such sentence, if retaken, it goes to the captor. The captor in the first of these two cases is entitled to a reward. (See SALVAGE.) This is the usage in the courts of the U. S., but a majority of the maritime states of Europe, including Great Britain, restore a recaptured ship to the original owner, even after she has been condemned by a prize-court and adjudged to the captor. It would seem that a neutral purchaser for value from the captor might thus lose his property. A French privateer is not compelled to restore a recaptured ship if an enemy has held it twenty-four hours, while a man-of-war must do so. Spain restores a recaptured ship to the neutral unless she is loaded with enemy's property. The amount of salvage payable to the recaptor by an owner differs. In Great Britain and the U. S. the usual rate is one-eighth of the value of ship and cargo, though the latter nation observes reciprocity in the matter, levying the same rate that would be applied to its ships by the state to which the recaptured vessel belongs. France charges one-tenth, but if recapture has taken place within a day only a thirtieth. Spain and Portugal charge one-eighth, but more if the recaptor is a privateer. Denmark and Sweden allow one-third and one-half respectively. The rate may be modified by treaty. Revised by T. S. WOOLSEY.

**Receipt** [from O. Fr. *receite* < Lat. *receptum*, liter., something received, neut. perf. partic. of *recipere*, receive]: the transaction by which property is delivered by one to another, or a writing acknowledging such a transaction. It is used in the first sense in the Statute of Frauds. (See FRAUDS, STATUTE OF.) A written receipt is to be distinguished from a RELEASE (q. v.) in that it does not destroy a subsisting right, but is merely evidence of a fact, and therefore may be explained or refuted. As it is merely evidence of a fact it is not a CONTRACT (q. v.), although the written instrument in which it appears may contain a contract also. A familiar example is a BILL OF LADING (q. v.), which sets forth a receipt of certain goods by a carrier and a contract to transport them. It is at times difficult to decide whether a particular instrument is a simple receipt or superadds to this a contract obligation. Even in the latter case the receipt is open to explanation, except in cases where the contradiction of the re-

ceipt would work a destruction of the contract. (*Basch vs. Humboldt Mutual Insurance Company*, 85 N. J. L. 429.) Whether the person delivering property or making payment pursuant to a legal obligation has the right to a simple receipt has not been settled by the courts, but statutes give such a right in certain cases. FRANCIS M. BURDICK.

**Receiver**: a person appointed by the court to receive rents, issues or profits of land, or other property which is in question between the parties to a litigation, or which belongs to one who is legally incompetent, as an infant. The appointment of receivers was resorted to by equity tribunals for the purpose of doing justice in cases where the jurisdiction and remedies of the common-law courts were inadequate. The general principles upon which a court of equity acts in appointing and controlling receivers are stated briefly by the U. S. Supreme Court as follows: "A receiver is appointed upon a principle of justice for the benefit of all concerned. Every kind of property of such a nature that, if legal, it might be taken in execution, may, if equitable, be put into his possession. Hence the appointment has been said to be an equitable execution. He is virtually a representative of the court, and of all the parties in interest in the litigation wherein he is appointed. He is required to take possession of property as directed, because it is deemed more for the interests of justice that he should do so than that the property should be in the possession of either of the parties in the litigation. He is not appointed for the benefit of either of the parties, but of all concerned. Money or property in his hands is in *custodia legis*. He has only such power and authority as are given him by the court, and must not exceed the prescribed limits. The court will not allow him to be sued touching the property in his charge, nor for any malfeasance as to the parties or others without its consent; nor will it permit his possession to be disturbed by force nor violence to be offered to his person while in the discharge of his official duties. In such cases the court will vindicate its authority, and, if need be, will punish the offender by fine and imprisonment for contempt." *Davis vs. Gray*, 16 Wallace 203.

Whether a receiver should be appointed in a given case is a matter of judicial discretion, which is exercised cautiously by the courts, especially in the case of a CORPORATION (q. v.). Modern legislation has given to law-courts authority to employ receivers, and has increased their powers and usefulness. The cases in which receivers are appointed fall into four classes: (1) Where there is no legal owner of the property, as in the case of an intestate's estate, or the owner is legally incompetent to manage it, as in the case of infants and lunatics. In the U. S., statutes often provide for a temporary administrator and give to guardians and committees an authority so wide as to render receivers unnecessary. (2) Where the litigants are legally competent to manage the property, but justice demands that neither party should control it, as in the case of winding up partnership affairs by judicial proceedings, or of the partition of property. (3) Where the legal title is held by one in a fiduciary capacity who is abusing his trust, as in the case of a suit against an executor, or a mortgagor, or of creditors' suits. (4) Where the proper enforcement of a judgment requires a receiver.

**Receivers' Certificates**.—Courts of equity are accustomed, at present, to authorize the receiver of a railroad company to borrow money for the operation of the road, and to issue therefor certificates which are made a first lien upon the property of the corporation. This extraordinary power is exercised because of the quasi-public character of railroads, and has been denied in the case of a private corporation, whose chief business was mining and selling coal. "A railroad corporation . . . is charged with the duty of operating its road as a public highway. If the company becomes embarrassed and unable to perform that duty the courts, pending proceedings for the sale of the road, will operate it by a receiver, and make the expense incident thereto a first lien. . . . Private corporations owe no duty to the public, and their continued operation is not a matter of public concern." (*Farmers' Loan and Trust Company vs. Grape Creek Coal Company*, 50 Federal Reporter 481.) Such certificates are non-negotiable securities; they do not pledge the general credit of the maker, but are payable out of a particular fund. Their validity depends upon the order of the court, and even a *bona-fide* purchaser will not be able to enforce them if the order has not been strictly followed in their issue. Their payment is not compelled by a suit at law, but by an order of the court. One who assigns or indorses them does not

of Bonn, Würzburg, and Berlin, graduating M. D. from the last in 1855; was assistant at the Berlin Pathological Institute from 1858 to 1864; in 1865 was appointed Professor of Pathological Anatomy at the University of Königsberg; in 1866 occupied the same chair at Würzburg; and in 1872 went to the Strassburg university. He has contributed many valuable papers to the literature of pathology. S. T. A.

**Reclus, re-klü', ÉLISÉE**: geographer; b. at Ste.-Foy-la-Grande, department of Gironde, France, Mar. 15, 1830; was educated in Rhenish Prussia, and studied in Berlin under Karl Ritter; traveled from 1852 to 1857 in England and America, and published after his return to Paris a number of valuable geographical works, partly in the *Revue des Deux Mondes*, partly in book-form, of which the most prominent are *The Earth* (2 vols., 1867) and *The Ocean, Atmosphere, and Life* (1872; translated into English by B. B. Woodward, New York, 1871 and 1872). His *Nouvelle Géographie universelle*, regarded as the most complete geographical survey of the world ever written, occupied him for twenty years (1874-94), and consists of nineteen volumes, of from 700 to 1,000 pages each. Among its illustrations are more than 8,500 maps. Holding extreme democratic views, when the revolution of Mar. 18, 1871, broke out he sided with the Commune, and later was sentenced to transportation for life, but upon the appeal of leading scientific men his sentence was commuted to banishment. He then resided in Italy, the U. S., and elsewhere. Having returned to Paris, he again became involved in communistic plots and fled to Switzerland. Though absent he was sentenced in 1894 to transportation for twenty years.

Revised by C. C. ADAMS.

**Reclus, PAUL, M. D.**: surgeon; b. at Orthez, Basses-Pyrénées, France, Mar. 17, 1847; studied medicine in Paris, graduating M. D. in 1876; in 1878 passed the *concours* for the hospitals; in 1880 was appointed associate and subsequently full professor of surgery. Among his writings are *Clinique et critique chirurgicales* (Paris, 1884); *Cliniques chirurgicales de l'Hôtel-Dieu* (Paris, 1887). S. T. A.

**Recluse** [from O. Fr. *reclus* < Lat. *reclusus*, shut up (in Mediæv. Lat., a recluse)]; in strict language, a monk or nun who from choice retired from communication even with members of the same order. The secluded person sometimes adopted this life by way of penance, sometimes as a means of spiritual progress. No one could be thus secluded without permission. The door was sealed in the presence of a superior officer, and could be unlocked only by the command of a bishop. The name "recluse" was given to the inmates of Port-Royal, the famous Jansenist retreat in Paris.

**Recognition**: the feeling of familiarity with which an image or object affects us. We say feeling, since the recognition, in itself, accompanies the act of knowledge in which the object or image is again presented; that is, reproduction is assumed in recognition. This feeling of familiarity is vague and often misplaced, and ordinarily goes unanalyzed. The means by which recognition arises vary as the recognition is of an object or of an image. In the case of the second perception of an object its recognition is probably accomplished by means of an image which is already recognized. We have a comparison between the percept and the image, and feel them the same or similar. This is seen to be the case in frequent instances in everyday life. If we are asked whether an object is the same as one seen before, we often say we do not know, for we do not remember how the former object looked; which means that we are unable to call up and recognize any image with which the object present may be compared. In the case of the recognition of an image such a procedure is impossible. It would presuppose another image still, and so on indefinitely. The question, therefore, is narrowed down to the means by which we recognize a reproduced image.

The recognition of an image depends upon the degree in which its apperceptive relations are re-established. The reproduction of an image consists in the reinstatement of the conditions, physical or mental, of the original perception. Such a reinstatement of the conditions suffices to bring an image back into consciousness; but it is not then necessarily recognized. It is only when some of the mental connections—the relations established among the perceptual elements by apperceptive attention—are again more or less consciously presented that the sense of familiarity is felt. It is necessary that there be some accompanying conscious elements to which the recognized elements are related. Often when an image arises in consciousness we do not rec-

ognize it till we bring back some association with it. Often, also, we see a face and in so far recognize it as to feel vaguely familiar with it, while we strive to bring up more of its apperceptive connections in order fully to identify it. This first vague recognition is probably due to the felt beginnings of the revival of the spatial proportions of the face. This is further proved by the fact that percepts which are not related in the first presentation—for example, single isolated sensations, as the stroke of a bell—are not generally recognized. We say of such presentations that there is nothing distinguishing or characteristic about them whereby they should be recognized; but this is only to say that there were no specific points of connection between this image and others, or between the parts which are separately apperceived. As soon as some sign is made of a peculiar kind in connection with the image it is recognized. Experiments by Lehmann on the recognition of differences of color strikingly confirm this view. Different shades of gray, which could not be recognized when seen alone, were recognized when they were given names beforehand, or when a number was attached to each in the first perception. Of nine shades without names or numbers only 46 per cent. gave true recognitions; while the same shades, with numbers, gave 75 per cent. of correct identifications. Here the introduction of a simple *local relation* in the perception gave the necessary clew. Further support is derived from the phenomenon of so-called psychic blindness, deafness, etc.—i. e. recognition is absent in animals deprived of the higher co-ordinating brain-centers.

This view of the case also enables us to take account of the subjective element of recognition, which is often overlooked. There is more in recognition than the sense of familiarity with an image. There is the feeling of ourselves as in familiar circumstances. This feeling of self develops largely in connection with active attention. Attention, however, is the organ of the process of apperception. Consequently, when by reinstatement of this process the fact of recognition is experienced, it carries with it essentially the feeling of an emphasized self: the self of the first apperception is again evident in the self of the reappearance, and the sense of sameness of the apperceptive content really arises with the sense of the sameness of the individual who has it. Recognition of the image, therefore, and sense of personal identity, both rest ultimately in differences in the amount, ease, facility, and good adjustment of the attention.

J. MARK BALDWIN.

**Recognizance** [from O. Fr. *reconnaissance* (> Fr. *reconnaissance*), recognition, deriv. of *reconnaître* (> Fr. *reconnaître*), recognize < Lat. *recognoscere*, know again, recognize]: in law, an obligation of record which a man enters into before some court of record, or magistrate duly authorized, with condition to do some particular act, as to appear and answer in criminal proceedings, to prosecute a case or an appeal, to keep the peace, etc. (2 Bl. Com., 341.) The recognizance is an acknowledgment (recognizing) of the existence of a debt or obligation appearing upon the record of the court, and need not be, like a bond, sealed and signed by the party. It is proceeded upon by a writ of *scire facias* or a summons, without the necessity of an action as in the case of a common bond. At common law it is a preferred debt, but in many States of the U. S. the preference has been abolished or modified. See Blackstone's *Commentaries*, and the *American and English Encyclopedia of Law* (under *Recognizance*). F. STURGES ALLEN.

**Recollet Friars and Nuns**: a name usually applied to one of the congregations of Franciscans of the strict observance, but sometimes designating reformed bodies of other orders. A congregation of Augustinian Recollets dates from 1530. The Franciscans who bear this name are especially those of the French congregation, founded in 1592 by the Duke of Nevers, Louis de Gonzaga (1530-95).

**Reconnaissance** [= Fr., liter., recognition, examination, deriv. of *reconnaître*, earlier *reconnoître*, recognize, examine, whence Eng. *reconnoiter*]: a preliminary or rough survey of a portion of country. A civil reconnaissance may be undertaken for the purpose of selecting suitable points for trigonometrical stations preparatory to a geodetic survey; for ascertaining the relative advantages and disadvantages of two or more routes preparatory to locating a line of railway, canal, or aqueduct; or for the purpose of acquiring a general idea of the features of an unexplored country. A military reconnaissance may be undertaken to ascertain the military resources of a tract of country; for determining

ing titles. This project is modeled on the Prussian law of May 5, 1872, which will therefore be taken as the basis of the following sketch of the modern German system.

The record (*Grundbuch*) is so arranged that all entries affecting a special parcel of land are made in one "folio." A special folio is regularly assigned, in the cities, to each lot, and in the rural districts to each farm or estate (*Gut*). In the latter case the several fields belonging to the estate are enumerated. The tax-number of each lot or field is given, with its area and its assessed rental value. (The tax-rolls and maps give the metes and bounds of the property as determined by governmental survey.) After the property has thus been described, the remainder of the folio is divided into three parts. In the first are noted all changes of ownership; in the second, all permanent charges upon the land, except taxes; all limitations of the owner's right (see *SERVITUDES*), and all restrictions upon the owner's power of alienation. In the third part are entered all mortgages, with the amount, the rate of interest, the date of their establishment, and the date at which payment is due. In parallel columns are entered assignments and payments, whether partial or in full.

The record is kept by the court of first instance in each judicial district. Entries are made only by order of the court, and on certain legally specified grounds, of which the most important are contract and judgment. In case of conveyance, the law requires a formal declaration from the recorded owner that he transfers the property to the conveyee and a demand from the conveyee that he be recorded as owner. The declaration and demand may be made in person or by attorney or in writing; but if by attorney or in writing the documents presented to the recording officers must be certified. Similar rules govern other entries based on the contract of the parties. If an entry is demanded on the ground of judgment, the judgment must be authenticated.

The recording officers determine the presence or absence of the grounds on which entries may legally be made, but they do not decide controversies. He who impugns the correctness of an entry already made, or protests against an entry which the recording officers are legally bound to make, must bring action in the proper court; but pending the judicial determination of the controversy, he may save his rights by securing the insertion of a "note" (*Vormerkung*). The same course is open to the person who demands an entry which the recording officers can not legally make until his claim is affirmed by a judgment. The "note" has about the same effect as notice of *LIS PENDENS* (*q. v.*) in the U. S. Where this safeguard seems insufficient, the court before which the controversy is pending may prohibit alienation, and such prohibition is then placed upon the record.

*Effect of the Record.*—The record enjoys *publica fides*. It is presumed to be accurate and complete. He who purchases from the recorded owner is therefore owner, unless it can be shown that he knew the record to be erroneous. In like manner, he who has taken a mortgage from the recorded owner, or an assignment of mortgage from the recorded mortgagee, has the rights of a mortgagee, unless it can be shown that he knew the record to be erroneous. Against the assignee of a recorded mortgage no defenses are admissible except those which are indicated on the record and those of which he can be proved to have had knowledge.

*Mistakes in the record*, it is claimed, are rendered extremely improbable by the rules governing entries. When they can be shown to exist, the record may of course be corrected, but no such correction will be permitted to prejudice the vested rights of third parties. The person who has suffered damage from a mistake in the record has therefore the following additional remedies: (1) An action, based on unjust enrichment (see *QUASI-CONTRACT*), against the person primarily benefited; (2) a subsidiary claim against the recording officers, when they are chargeable with willful wrong or negligence; and (3) if the recording officers are liable but insolvent, a claim against the State.

*Modifications of the Law of Mortgage.*—The German system of recording has led to important changes in the whole law of real property, some of which have already been indicated. Special innovations in the law of mortgage are as follows:

(1) *Specialty.*—No lien can be imposed upon the entire estate of a debtor, nor even on all his realty. Judgment liens, for example, can be made effective only by having special mortgages recorded against special pieces of property.

(2) *Owner's Mortgage.*—When the owner of property pays off a mortgage he may elect to have the mortgage assigned

to himself. In such case no *MERGER* (*q. v.*) takes place; the mortgage, whether it remains in the name of the owner or is assigned by him to a third person, retains its validity and its priority.

(3) *Land-debt.*—A lien on the land which operates like a mortgage may be created without any accompanying personal obligation upon the part of the mortgagor. Such a lien the Germans call a "land-debt" (*Grundschild*). No such defenses as are derived, in the case of the ordinary mortgage (*Hypothek*), from the invalidity of the personal claim can be pleaded against the land-debt, for it is not a collateral but an independent claim. On the other hand, the land-debt is not enforceable against the person who created it except while he holds the land.

(4) *Owner's Land-debt.*—The land-debt may be established in favor of the owner himself. This rule enables the owner of realty to give a second mortgage and at the same time to reserve a first.

(5) *A letter of mortgage* (*Hypothekenbrief*) is an authenticated extract from the record, issued by the recording officers, attesting a particular mortgage, and showing all the facts that are of importance to the holder. In the case of the ordinary mortgage such an extract may be issued with the consent of the mortgagor, and its issue is noted on the record. In the case of the land-debt such an extract is always issued (*Grundschildbrief*). The purpose of the extract is to facilitate assignment by avoiding the necessity of entering each successive assignment upon the record. Any person who presents the extract and shows that it has come into his hands in the manner provided by law (certified transfer) is entitled to receive interest, and, in case of default, to foreclose. The original creditor, of course, can exercise none of these rights unless he is still in possession of the extract. The extract is thus practically a secondary record, separated from the parent record but enjoying the same *publica fides*. The lien on the land is put into circulation after the fashion of a negotiable instrument. In the case of the land-debt, where most of the defenses available against the ordinary mortgage are excluded, the analogy to commercial paper is particularly obvious, and the German jurists describe the "letter of land-debt" as "a bill of exchange on the land."

It is claimed, and with apparent justice, that the German system makes the ascertainment of title simpler and the security of title greater than any other system yet devised; and that it therefore gives a safer basis to credit than any other system.

See Gide, *Le Régime Hypothécaire en Prusse* (1873); and Achilles, *Grundeigenthum und Hypothekenrecht* (1881).

MUNROE SMITH.

**Recoupment** [from Fr. *recouper*, cut again, cut off]: a species of defense in actions brought to recover damages for the non-performance of a contract, whereby the defendant alleges that he has himself sustained damages by the plaintiff's breach of the same contract, or by the plaintiff's fraud in procuring him to enter into it, which he seeks to cut off or "recoup" from the amount that would otherwise be recovered against him. The doctrine of recoupment has become established by judicial decision both in England and in the several States of the U. S., although there are some slight differences in the extent to which it has been carried by the various courts. Like the defense of set-off, it is confined to actions upon contract, and must itself arise from contract, but here all resemblance ends. A set-off must be for a debt, a certain fixed sum; recoupment is of damages often entirely unliquidated; a set-off is necessarily a demand arising upon a different contract from the one in suit; recoupment is necessarily of damages arising from a breach of the very same contract sued upon; in set-off the defendant may sometimes recover a balance from the plaintiff; in recoupment this can never be done. Recoupment (as is indicated by the etymology) can strictly be used only as a defense, and can do no more at most than defeat the plaintiff's recovery; even if the defendant's damages should exceed those of the plaintiff, he can have no judgment for such excess. In this last-mentioned particular the doctrine of recoupment has been greatly enlarged by the reformed system of procedure prevailing in the U. S. in many of the States, which permits the defendant by means of a counterclaim to recover an affirmative judgment for damages against the plaintiff when the grounds for such recovery have been established by the proofs. See Sedgwick on the *Measure of Damages*. Revised by F. STURGES ALLAN.

**Red Cross**: the name applied to the international treaty arranged by the Geneva convention of 1864, as well as to the various societies organized to carry out its aims. These center in the cause of humane and merciful treatment of wounded, sick, and dying soldiers in time of war. The Red Cross is the distinctive flag designated in the treaty, by which all hospitals (field or permanent), ambulances, persons, materials, and appliances employed in the relief service are known as such; and whenever the flag is displayed accompanied by the national flag to which the hospital, etc., belongs, it is treated, respected, and protected as neutral. Under the treaty soldiers disabled by wounds or sickness who have fallen into the hands of the enemy may be sent through the lines; if healed in the hands of the enemy and incapable of bearing arms, they must be delivered to the outposts to be sent to their homes, upon request; if capable of further military service, they may be sent to their homes on condition of not again bearing arms during the war. Thus the spirit of the Red Cross treaty makes of a wounded or sick soldier a neutral, a non-combatant. The Red Cross movement is civil in its origin, and the various national committees, societies, or associations organized to carry into effect the objects of the treaty are purely civil. They place themselves in communication with their respective governments, and in time of military activity they co-operate with, and become auxiliaries and aids to, the medical and surgical departments of the armies. In time of peace they variously employ themselves in preparing for emergencies.

At the battle of Solferino, Italy, June 24, 1859, the terrible and needless suffering and loss of life caused by days of neglect to care for the wounded and dying were witnessed by a philanthropic Swiss gentleman, Henri Dunant, of Geneva. He personally aided the insufficient medical forces of the armies, and realizing that such conditions ought not to exist, and need not, if the humanitarian impulse and efforts of the people could prevail, he conceived the idea of pledging the nations of the earth to regard and protect as neutral all sick and wounded combatants, and all persons and means engaged in giving them succor. He elaborated these ideas and feelingly described the scenes on the battlefield in a book which he wrote, *Un Souvenir de Solferino*. The cause was warmly espoused by La Société Genevoise d'Utilité Publique, of which Dunant was a member, and through the co-operation of the Swiss Federal Council an international conference was assembled at Geneva in Oct., 1863. This meeting was attended by delegates from sixteen governments, and continued in session four days. It was followed by a convention, to which all nations were invited to send representatives, and which convened in Geneva, Aug. 8, 1864. Twenty-five delegates representing sixteen governments attended. The session continued until Aug. 22, and culminated in the agreement to nine "articles of the convention for the amelioration of the condition of wounded in armies in the field." These articles were signed by twelve governments before the convention adjourned, and the treaty was left open for the accession of others. The signatory powers have reached forty in number.

The treaty designates "a red cross on a white ground" as the distinctive and uniform flag and arm-badge that shall be adopted for all hospitals, ambulances, and personnel; and provides that it must on all occasions be accompanied by the national flag; also that the delivery thereof (in time of action) shall be left to the military authority. The red cross on a white ground was adopted as a well-merited compliment to the Swiss confederation, whose national flag is the reverse—a white cross on a red ground.

The Geneva conference stipulated that each treaty nation shall have one national committee or society, civil in character and functions, which shall be the medium of communication with its government, and shall alone possess the right to use the red cross, and to authorize its use at its discretion. The national committees are usually composed of the most distinguished philanthropic persons in public and private life, with the chief magistrate or ruler frequently at the head.

To prevent desecration of the insignia by unauthorized use, severe governmental prohibitive measures have very generally been adopted.

A committee at Geneva, Switzerland, of which Gustave Moynier is president, is recognized as the international committee, through which all international communication is had. An international bulletin is published by that committee, and many other national committees publish journals or other literature of their work, which are inter-

changed. Many of the societies have been permanently endowed with large sums of money. Others receive the direct patronage of their royal heads or members.

Similar articles pertaining to naval warfare were formulated at Paris in 1866, but have not been generally adopted and ratified.

Upon the formation of the American National Red Cross, its president, Miss Clara Barton, perceiving a far wider usefulness for its work by applying it to the relief of great national calamities other than war, such as famine, pestilences, fires, or cyclones, incorporated such a feature into the charter of the association which she formed. The innovation received unanimous sanction by the international and other national committees, and the broader scope thus inaugurated was denominated the "American Amendment." Money, food, clothing, buildings, agricultural implements, seed, and other means aggregating over \$1,000,000 in value have been distributed on thirteen fields of relief by the American National Red Cross under the "American Amendment"; notably at Johnstown, Pa., after the flood, in Russia during the famine, and on the South Carolina Sea islands devastated by cyclone and tidal wave. No money estimate can be made of the practical benefits educationally, as particularly exemplified in teaching the colored sufferers on the Carolina islands the advantages of frugality, of concentrated action in reclamation of their ruined lands, and of self-reliance generally.

CLARA BARTON.

**Redding**: city; capital of Shasta co., Cal.; on the Southern Pac. Railroad; 170 miles N. by W. of Sacramento (for location, see map of California, ref. 8-C). It is in an agricultural, lumbering, and mining region, and contains 2 State banks with combined capital of \$175,500, and 2 weekly newspapers. Pop. (1880) 600; (1890) 1,821.

**Reddle, Raddle, or Red Chalk**: an argillaceous oxide of iron exported from Germany and England. It is used for carpenter's chalk, for marking sheep, for drawing on paper, and in the case of fine grades for polishing spectacle-lenses.

**Redemptionists**, called also **Mathurins, Fathers of Mercy, and Trinitarians** (*Ordo Sanctissimæ Trinitatis*): a brotherhood of the Roman Catholic Church founded by John de Matha and Felix of Valois at Cerfroi in France for the deliverance of Christian captives in Barbary. It was approved by Innocent III. in 1199.

**Redemptorist Fathers, or Liguorians** (*Congregatio Sanctissimi Redemptoris*): a congregation of missionary priests founded in 1732 by Alfonso de' Liguori at Scala in Italy. They are most numerous in Italy, Austria-Hungary, and the U. S. They devote themselves chiefly to the holding of "missions" for the increase of religious activity among the people. The original rules of the congregation were unusually severe, allowing only sacks of straw for beds, hard bread and soup at table, and imposing long seasons of worship every night, self-flagellations three times a week, and missionary activity among the very poorest classes. In addition to the usual vows of poverty, chastity, and obedience, a fourth vow was enjoined, by which the member was obliged to refuse all honors and benefices outside of the order, except upon the express command of the pope. In course of time, however, the rules have much relaxed. The congregation has twenty houses in the province of Baltimore, and seven in that of St. Louis.

Revised by J. J. KEANE.

**Redfield**: city; capital of Spink co., S. D.; on the James and Turtle rivers, and the Chi. and N. W. and the Chi., Mil. and St. P. railways; 41 miles S. of Aberdeen, 87 miles N. by W. of Mitchell (for location, see map of South Dakota, ref. 6-F). It is in a wheat and stock-raising region, and contains Redfield College (Congregational, chartered in 1887), a national bank with capital of \$50,000, and a monthly and two weekly periodicals. Pop. (1890) 796.

**Redfield, WILLIAM C., A. M.**: meteorologist; b. at South Farms, near Middletown, Conn., Mar. 26, 1789; was in early life a mechanic; conceived the fundamental idea of his famous "law of storms" as early as 1821; soon afterward established a line of steam towboats on the Hudson; issued many essays and pamphlets in favor of steamboat navigation; was subsequently an active promoter of railways, especially such as would connect the Hudson with the Mississippi; published at different times forty essays upon meteorology; promulgated his *Theory of Storms* in 1831, and his views upon hurricanes in 1833; devoted much attention to

slowly move up stream. In 1854 the lower end of such a raft was located at a point 53 miles above Shreveport, La., extended 13 miles up-stream, and was forming at the rate of  $1\frac{1}{4}$  to 2 miles a year. It is stated that at an earlier date this raft was 200 miles lower down the river. Vegetation takes root on the older portions of the rafts, and what are termed "floating forests" are formed. In 1873, when a navigable channel was opened in the raft above Shreveport, it was 32 miles long. This great raft, before it was disturbed, formed a dam, which checked the flow of the river, and produced a lake-like expansion from 20 to 30 miles long above it. When a channel was opened through it the water above was lowered 15 feet. In recent years the river has been patrolled by "snag-boats," and thousands of trees, stumps, and other obstructions removed annually.

Owing to the timber-dams formed naturally in Red river, and to the abundant silt deposits left on its immediate banks during high-water stage, natural levees are formed along its borders which deflect tributary streams and frequently cause them to form lakes.

Consult *Physics and Hydraulics of the Mississippi River*, by Humphreys and Abbot (1861), and the Annual Reports of the Chief of Engineers U. S. army. ISRAEL C. RUSSELL.

**Red River of the North:** a river which rises in Western Minnesota, near the source of the Mississippi, flows northward for 250 miles through the so-called Red river valley, and empties into Lake Winnipeg. Its source is at an elevation of 1,600 feet, where it enters Canada it is 767 feet, and at its mouth 710 feet above the sea. Its drainage area, not including that of the Saskatchewan with which it unites, is between 43,000 and 44,000 sq. miles, of which three-fourths are S. of the U. S.-Canadian boundary. The region it traverses is a nearly level plain, once the bed of Lake Agassiz, and is famed for the abundance and excellence of its wheat harvests. The river has cut a narrow channel from 20 to 50 feet deep through lacustral deposits, and furnishes a typical example of recent drainage on a nearly horizontal, new land area. The river is navigable from its mouth to near its source. During high-water stages it is connected by way of Lakes Traverse and Big Stone with the Mississippi, and steamboats can occasionally pass from the Mississippi to Lake Winnipeg. ISRAEL C. RUSSELL.

**Redroot:** See *CEANOTHUS AMERICANUS*.

**Red Sea, or Arabian Gulf:** a long, narrow inlet of the Indian Ocean; between Arabia on the E. and Abyssinia, Nubia, and Egypt on the W.; separated from the Mediterranean by the Isthmus of Suez, which is only 80 miles across, and communicating with the Indian Ocean through the Gulf of Aden and the Strait of Bab-el-Mandeb, which is only 14 miles broad. The entire length of the Red Sea is 1,450 miles; its greatest breadth is 230 miles; its depth varies from 1,054 fathoms in lat.  $22^{\circ} 30'$  N. to 3 fathoms in the harbor of Suez. It is called in the Old Testament "the sea of *soph*," a seaweed resembling wool. Why, in later times, it was called the Red Sea, writers are not agreed. Herodotus (*Hist.*, ii., 11) reports "a flow and ebb of the tide every day." Recent scientific surveys have shown a tide of 5 to 7 feet at Suez, but much less to the southward. Much, however, depends upon the strength of the wind, which blows from the S. S. E. from October to May, and is strongest in February; and from the N. W. the rest of the year, and is strongest in June and July. Near its northern extremity the sea forks into two branches—one, the Gulf of Akaba, length 100 miles and breadth 15, occupies a depression which is the continuation southward of the valley of the Jordan and Dead Sea; the other, the Gulf of Suez, length 200, breadth 20 miles. In the Sinaitic isthmus, lying between these arms, is Mt. Sinai. The Israelites (see Exodus) are supposed to have crossed in April the Gulf of Suez, near the existing town of that name, the sea at that time extending with small depth some 30 miles farther N. On account of the violence of its winds, and the great number of islands, shoals, and coral reefs which lie along its shores, the navigation of the Red Sea has always been considered very difficult; nevertheless, from the very earliest times it has formed one of the commercial highways of the world, being the shortest and most convenient road between Europe and India. After the discovery of the route around the Cape of Good Hope the traffic which first the Egyptians and Phœnicians, and then the Greeks, the Romans, and the Venetians, had carried on with India over the Red Sea, declined greatly, but the construction of the Suez Canal has once more led this commerce back into its old channel.

**Red Seaweeds:** the *Rhodophyceæ*; a class of aquatic plants (mostly marine) notable for their red or purple color. The many-celled plant-body is of various forms, from a simple flat thallus to a branching, leaf-bearing axis. Sexual reproduction takes place by the fertilization of a carpogone (by non-ciliated antherozoids), this resulting in the growth of carpospores, and sometimes of a pericarp (Fig. 1) also. Asexual reproduction takes place by the germination of tetraspores, which are produced in various places on the plant-body by the subdivision of cells into four parts. The class is equivalent to the *Rhodospirææ* of many authors, and includes but one order (*Florideæ*).

FIG. 1.—A red seaweed (*Lejolinia*): a, antherid; b, carpogone with slender trichogyne; c, sporocarp; d, sporocarp in vertical section; e, an escaped carpospore. Magnified 150 diameters.

According to Agardh, the known species are between 1,500 and 2,000, widely distributed in all seas, and to a limited extent in fresh water (e. g. species of *Batrachospermum*, *Hildenbrandtia*, *Lemanea*, etc.). The plants are never of large size, rarely attaining a length of more than a few inches, and in some cases they are minute. They are frequently of delicate texture and beautiful outline. The red or purple color is due to the presence in the cells of a soluble substance, phycoerythrin, which hides the chlorophyll. Upon immersion in fresh water the red color of many marine species is discharged, thus disclosing the underlying green.

Agardh has arranged the many families in six groups (which he terms "series") upon characters derived from the structure and development of the spore-fruit (cystocarp). Here only a few general characters will be given, to which there are many exceptions.

**Series I. GONGYLOSPERMEÆ.** Spore-fruits external or immersed in the substance of the thallus, surrounded by a gelatinous envelope; spores irregularly arranged; plant mostly filamentous, sometimes solid or compressed.

Two families, the *Ceramiceæ* and the *Cryptonemiaceæ*.

FIG. 2.—*Ceramium rubrum*: a, portion of plant; b, spore-fruit, magnified.

contain many beautiful species—e. g. *Ceramium rubrum* (Fig. 2), very common along the coasts of the U. S., *Phyllo-serrata*, and species of *Griffithsia* and *Callithamnion*, the latter often minute and of great delicacy.

**Red Snow**: real snow tinted by the presence of *Hematococcus lacustris* (or *Protothoccus nivalis*), microscopic algae of the order *Protothecaceae*. The cells are sub-globose, and about 50 micromillimeters ( $\frac{1}{100}$  inch) in diameter. In 1819 Ross found banks of red snow on the eastern shore of Baffin Bay extending for miles, and these were in some parts 12 feet deep.

Revised by CHARLES E. BESSEY.

**Red Sulphur Springs**: magisterial district; Monroe co., W. Va.; on Indian creek and a turnpike 12 miles from Lowell Station on the Ches. and O. Railway; 38 miles S. W. of White Sulphur Springs (for location, see map of West Virginia, ref. 11-G). It is in a beautiful valley of the Alleghany Mountains, is a fashionable watering-place, and is said to contain the only springs of their kind in the country. The water contains phosphorus and a peculiar sulphur compound or gelatinous substance, which is its distinctive feature. The curative properties of the water have been known for more than half a century. Pop. of district (1880) 2,557; (1890) 2,845.

**Reductio ad Absurdum**: a process of reasoning by which the statement in dispute is made one premise of an argument and an acknowledged truth the other, the conclusion drawn from them being so absurd that the falsity of the premise in dispute must be conceded.

**Reduplication**: the repetition or doubling of a syllable, a root, or even a complete word, as a method of word-formation. It is a widespread phenomenon of language, and serves a variety of purposes in expression; thus it expresses plurality, reciprocity, repetition, continuousness, intensity, superlative quality, completion, imitation of natural sounds, etc., and is characteristic of nouns as well as verbs. The Indo-European languages abound in traces of an extensive use of this method in the primitive stages of the mother-speech, and cases also occur of its use within the separate history of the languages. (1) The reduplication may consist of the doubling of a root; cf. Lat. *murmur*, a murmuring noise, *querquerus*, shivering cold; Gr. *μέρμερος*, marvelous, *βάρβαρος*, unintelligible in speech, *λάλᾶ*, battle-cry, *γάργαρα*, muddle. (2) The doubling appears as incomplete, or one syllable of the reduplicated form is weaker than the other; cf. Lat. *quisquiliæ*, scraps, *memor*, mindful, *momordi*, I have bitten; Gr. *διδασχῆ*, doctrine, *διδάσκω*, teach, *δεδόκη*, I have seen, *ἑώρα*, I have seen, *πορφόρου*, be in movement, *γύγυλος*, round, *ἀλλήλων*, one another, *γίγνομαι*, become (Lat. *gigno*). (3) A word is doubled; as Lat. *quisquis*, *quidquid*, *quaque*, *jamjam*, *quamquam*, *quotquot*, *meme*, *sese*; Gr. *πᾶν*, *πᾶν*, *πᾶν*, more and more; Sanskr. *āharahar*, day by day, *padē-padē*, step by step. See K. Brugmann's *Compar. Grammar of the Indo-Germanic Languages*, vol. ii., §§ 51-54, 465-476; A. F. Pott, *Doppelung, als eins der wichtigsten Bildungsmittel der Sprachen, beleuchtet aus Sprachener aller Welttheile* (1862).

BENJ. IDE WHEELER.

**Red Water, or Black Water**: a disease of cattle, sheep, and goats, characterized by the passage of reddish, brown, or black urine. This disease is most frequently observed among cattle at pasture on low lands, new fields, or soils imperfectly drained. It is thought to be caused by irritating plants which grow in such localities; it may usually be prevented by the amelioration of the soil.

L. P.

**Red Wing**: city (founded in 1853); capital of Goodhue co., Minn.; on the Mississippi river at the head of Lake Pepin, and on the Chi., Mil. and St. P., the Duluth, Red Wing and Southern, and the Minneapolis and St. L. railways; 41 miles S. by E. of St. Paul, 63 miles W. N. W. of Winona (for location, see map of Minnesota, ref. 10-F). It is situated on a plain between the river and bluffs that rise to a height of over 300 feet above tide-water, and is one of the most important wheat-shipping points in the U. S. It is substantially built; has water, sewerage, electric-light, and street-railway plants; and contains flour and saw mills, boot and shoe factories, stoneware, sewer-pipe, and lime works, and furniture-factories. There are 14 churches, 4 collegiate institutions, Evangelical Lutheran Seminary (chartered in 1878), State Reform School, Library of the State Board of Health (founded in 1873), a national bank with capital of \$100,000, 2 State banks with combined capital of \$111,000, a savings-bank, and a daily and 5 weekly newspapers. Pop. (1880) 5,876; (1890) 6,294; (1894) estimated, 8,300.

**Red-winged Blackbird**: See BLACKBIRD.

**Redwitz-Schmölz**, OSKAR, Freiherr von: poet; b. at Lichtenau, Bavaria, June 28, 1823; studied law at Erlangen

and Munich, and later on German philology at Bonn; was for a short time Professor of Literature at the University of Vienna, but resigned his position and devoted himself entirely to literature. He gained a wide reputation by his first work, *Amaranth* (1849), an epic poem written in praise of the Roman Catholic religion, and filled with sentimentality. His later works, *Das Lied vom Neuen Deutschen Reich* (1871), *Odilo* (1878), and his novels *Hermann Stark*, *deutsches Leben* (1869), *Haus Wartenberg* (1884), and *Hymen* (1887), are the productions of a genuine poet. He died July 16, 1891.

JULIUS GOEBEL.

**Redwood**: the *Sequoia sempervirens*, a noble coniferous timber tree of California, second in size to the *Sequoia gigantea*, or big tree, alone among North American trees. It occurs in great forests upon the coast mountains of California, and often attains a height of 275 feet and a diameter of 15 feet. It is extensively sawn for building purposes. When fresh its wood is of a fine red color, but it slowly fades when exposed to light. (See SEQUOIA.) The redwood sometimes used by dyers is from *Adenantha pavonina*, a large leguminous East Indian tree.

**Redwood City**: town (founded in 1849); capital of San Mateo co., Cal.; on Redwood creek, navigable for vessels of light draught to this point, and on the Southern Pac. Railroad; 28 miles S. of San Francisco (for location, see map of California, ref. 8-B). It is in an agricultural, lumbering, and grape-growing region; contains 4 churches, a public school, a State bank with capital of \$102,800, and 2 weekly newspapers; and is an important shipping-point for redwood lumber. Pop. (1880) 1,383; (1890) 1,572; (1894) estimated, 3,000.

EDITOR OF "TIMES-GAZETTE."

**Redwood Falls**: city; capital of Redwood co., Minn.; on the Redwood river, and the Chi. and N. W. and the Minneapolis and St. Louis railways; 26 miles N. N. W. of Sleepy Eye Lake, 110 miles S. W. of Minneapolis (for location, see map of Minnesota, ref. 10-C). It is in an agricultural region, and contains Methodist Episcopal, Protestant Episcopal, Presbyterian, Christian, Roman Catholic, and Adventist churches, a handsome graded school building, county court-house that cost \$30,000, 3 State banks with combined capital of \$100,000, and 2 weekly newspapers. In the vicinity are mines of coal, gold, and mineral paint. Pop. (1880) 981; (1890) 1,238; (1894) estimated, 2,200.

EDITOR OF "GAZETTE."

**Reed** [O. Eng. *hrēod* : O. H. Germ. *riot* > Mod. Germ. *ried*, *reed*] : a name proper to certain tall woody grasses smaller than canes and bamboos. The common reed (*Phragmites communis*) of North America, Europe, and Asia is employed on the Eastern continent as thatch, as a material useful in clay walls and floors, etc. The more extensively grown reed of Europe is *Arundo donax*, the woody stems of which are used for a great variety of purposes, especially by the horticulturist and in making musical instruments, fishing-rods, canes, etc. The smaller cane of the U. S. (*Arundinaria tecta*) is often called a reed. Its chief use is in making stems for tobacco-pipes.—REED is also the vibrating tongue or spring, fixed in a narrow slit, which produces musical tones in many wind instruments, such as the melodeon. It was once made of the reed (*Arundo donax*), whence the name. See REED INSTRUMENTS.

**Reed**, DAVID BOSWELL, M. D.: chemist; b. in Edinburgh, Scotland, in 1805; educated at the High School of Edinburgh, and in medicine at the university of that city, where he was an assistant to Prof. Sir John Leslie; was elected president of the Royal Medical Society and member of the Royal College of Physicians and of the Royal Society of Edinburgh; became instructor in chemistry in the university, teaching that science also to private classes; superintended the improvements in ventilation made in the House of Commons 1836, in the House of Peers 1839, and had charge of the ventilation department in the construction of the new houses of Parliament 1840-45; afterward applied his principles to public buildings in Liverpool and other large cities; visited Russia for a similar purpose; settled in the U. S. 1856; was for some time Professor of Applied Chemistry in the University of Wisconsin; became a resident of St. Paul, Minn.; became medical inspector to the U. S. Sanitary Commission 1863. D. at Washington, D. C., Apr. 5, 1864. He was the author of many books and publications upon chemistry and ventilation.

**Reed**, Sir EDWARD JAMES, K. C. B.: chief constructor of the British navy; b. at Sheerness, Kent, Sept. 20, 1830;

**Reeves, JOHN SIMS**: singer; b. at Shooter's Hill, in Kent, England, in Oct., 1822; son of the organist of the village church. At eight years of age young Reeves could read any music at sight. At the age of fourteen he himself became the organist and the choir-master of the village church. Under Calcott and Cramer and other masters he became proficient in harmony and counterpoint. Under the name of "Johnson," at Newcastle-on-Tyne, he made his first real public appearance in June, 1839, singing the part of the Gypsy Boy in *Guy Mannering*. His voice at this time was looked upon as barytone, and it was not until 1847 that he sang as a tenor. After studying in Paris and in Milan he made his Italian *début* at La Scala Opera-house, Milan. He appeared, Dec. 6, 1847, at Drury Lane, London, as Edgardo in *Lucia di Lammermoor*, and was enthusiastically received. In 1848 he was engaged with the company at her Majesty's theatre, London, but owing to a dispute with the management appeared but once. He then attempted sacred music, with which his fame and memory must always be associated. Singing in *Judas Maccabeus* at Exeter Hall he astonished the critics, who had not suspected his versatility. He afterward devoted himself entirely to concerts, sacred and secular. In July, 1892, he retired from the stage and accepted a professorship in the Guildhall School of Music, London. B. B. VALENTINE.

**Re-exchange**: in the usual application of the term, the loss resulting from the dishonor of a bill in a country different to that in which it was drawn or indorsed. (Chalmers's *Bills of Exchange*, 4th ed. 193.) A New York merchant wishes to pay a debt in London. He buys a bill on London; it is dishonored at maturity; he is entitled to the amount of money called for by the bill in London; he would not be indemnified by recovering in New York the amount of the bill with interest and protest fees; he has a right to draw in London a re-draft on the drawer or indorser in New York for an amount which will put him at once in possession of the money called for and promised to him by the original bill: this re-draft is called re-exchange. It will include not only the sum promised by the original bill, but the exchange on New York, the interest, and necessary expenses of the transaction. (*Suse vs. Pompe*, 8 Common Bench, N. S. 538; *Bank vs. U. S.*, 2 Howard 737.) Although this re-exchange bill is seldom drawn, the right to draw it fixes the damages recoverable by the holder in case of the dishonor of the original bill, unless the terms of the bill limit the damages, or a statute prescribes them. (See N. Y. Revised Statutes, 8th ed., p. 2501; Mass. Public Statutes of 1892, ch. 77.) The term re-exchange is used to signify, also, the loss on a particular transaction occasioned by the exchange being adverse, and the course of exchange itself. For further information, see Chalmers's *Bill of Exchange*, 4th ed., p. 194; Daniels, *Negotiable Instruments*, ch. xlv.

FRANCIS M. BURDICK.

**Referendum** [Lat., neut. of *referendus*, gerundive of *referre*, refer]: the practice of submitting legislative measures to the voters for ratification. It is observed in Switzerland, and favored by many political writers in the U. S., Great Britain, and Belgium. See LAW-MAKING, METHODS OF (*Switzerland*).

**Reflecting Circle**: an astronomical instrument for measuring angles by the reflection of light from two plane mirrors which it carries. It differs from the sextant chiefly in having an entire circle. See SEXTANT.

**Reflection** [from Lat. *reflec'tere*, reflect; *re-*, back + *flec'tere*, bend, turn]: the act of the mind whereby it examines itself or looks upon its own states as its objects. It is one of the most unique activities of the mental life. It is different from simple consciousness, in that in the latter there is no such thing as self-examination, and no act of setting up a conscious relation between the subject, or thinker, and the object, or what he thinks about. Reflection in its full sense seems to characterize man alone in the range of animal life; although wherever there is the beginning of the notion of self, there is also probably the beginning of this function of thinking about self which constitutes reflection.

This mental act is the great resource of self-observation and analysis, upon which the psychologist depends for most of his information. As a method, its use is called "introspection." In philosophy, reflection has always been the function upon which idealistic thought has based itself: for there is in nature nowhere else than in consciousness the fact of one kind of event setting itself over against another

and criticising it. The inference is that this relation can not be accounted for in terms of the play of objective forces in nature, and so must be an ultimate kind of activity or reality. The theory of reflection is closely allied to that of JUDGMENT and KNOWLEDGE (*qq. v.*). J. MARK BALDWIN.

**Reflection of Light**: that bending which occurs in the path of a light ray when it is turned back from a surface upon which it falls. When a light-ray falls upon an unpolished surface, it is irregularly reflected or scattered in consequence of the different inclinations of the innumerable facets of which such surfaces are composed, as may be seen under the microscope. Non-luminous bodies are made visible by the scattering of light from their surfaces. When a ray falls upon a perfectly smooth surface, it is regularly reflected, and a virtual image of the illuminating body is seen behind the reflecting surface. Most surfaces which reflect regularly also reflect irregularly to some extent. The two portions of a reflected light-ray, before and after bending, are called respectively the incident and reflected ray. If a perpendicular or normal be erected to the reflecting surface at the point of incidence, the angles made with this normal by the incident and reflected ray are called the angles of incidence and reflection. The law of reflection is: *The angles of incidence and reflection are equal, and the incident and reflected rays and the normal lie in one plane.*

From the law of reflection it is evident that all rays diverging from a point and reflected from a plane surface appear to emanate from another point situated at the other side of the surface, and at an equal distance from it. Hence when an object is placed in front of a plane mirror the apparent image is of the same form and magnitude and at an equal distance from the other side of the mirror; but all the parts are reversed, like the negative of a photograph, the right hand of the object appearing on the left in the image and *vice versa*. For parabolic reflection, see LIGHTHOUSE (*Lighthouse Illumination*).

The intensity of reflected light varies with the nature and the position of the reflecting surface, the reflecting powers of various substances being greater for small angles of incidence than for large ones, and depending upon the index of refraction between the surface and the medium in which the light is traveling. See REFRACTION.

The phenomenon of reflection takes place equally with ether vibrations of all kinds, such as those of radiant heat and electro-magnetic undulations, and its laws are the same as in the case of light. Revised by R. A. ROBERTS.

**Reflex Action** [*reflex* is from Lat. *reflexus*, perf. partic. of *reflec'tere*, bend or turn back; *re-*, back + *flec'tere*, turn]: direct response of the nervous system to external stimulation—for example, the winking of the eyes when an object approaches, moving when tickled, etc. These actions are contrasted in physiology and psychology with "voluntary actions," those which owe part of their stimulus at least to central processes. Reflex actions are regular, definite, beyond control, inherited, and presided over by the lower centers of the brain and spinal cord. J. M. B.

**Reformation**: the name usually given to the religious revolution of the sixteenth century which divided the Western Church into the two sections known as Protestant and Roman Catholic. This movement was not an isolated event, but was closely connected with the intellectual and social changes which marked the transition from the Middle Ages to the modern era of civilization. It was also long in preparation. The disaffection with the hierarchy which disclosed itself in the rise of sects like the Waldenses, and within the Church in the reforming councils of the fifteenth century held at Pisa, Constance, and Basel; the rise of radical reformers, "forerunners" of Protestantism, as Wickliffe and others; the spiritual doctrine of the Mystics; political opposition to the Roman see, dating from the old contests of the empire with the pope; and especially the influence of the revival of learning in promoting general culture, in hastening the downfall of scholastic theology, and in producing a diligent study of the Bible and of Christian antiquity—these are antecedents of Protestantism which deserve special mention. Under this last head the work of Erasmus is very important. Protestantism, as a religious system, had two main principles—viz., the exclusive authority of the Bible as the rule of faith, as opposed to the normative authority of the pope or the Church—a principle that involves the right of private judgment; and the doctrine of justification by faith alone, in contradistinction to salvation

VII. *The Reformation in France.*—A class of mystics, of whom Lefèvre was the most conspicuous, and among whom were Margaret, sister of Francis I. and Queen of Navarre, and Briçonnet, Bishop of Meaux, sympathized with the doctrine of justification by faith, though they were not averse to the traditional doctrine of the sacraments. Humanism was favorable to reform, and Francis I., who was proud of being styled the "father of letters," encouraged innovation up to a certain degree, when his interests prompted him to lend it assistance. On other occasions he was a cruel persecutor of Protestantism at home, even when, out of hostility to the emperor, he was giving help to Lutheranism in Germany. His vacillation was productive of great mischief. Yet Protestantism, mainly from the influence of Calvin and of Geneva, gained a foothold in France in his reign. His successor, Henry II., was inimical to the Reformed faith, especially after the Treaty of Cateau-Cambrésis with Spain. Nevertheless, Protestantism in his reign made great progress. In 1558 it was estimated that there were 2,000 places of Reformed worship scattered over France, and congregations numbering 400,000 organized after the German pattern. In 1559 they ventured to hold a general synod in Paris. The Huguenots, as they were called, became, by the force of circumstances, a political party. The family of Guise gained such ascendancy in the Government during the reign of the young Francis II., and eventually under Charles IX., as to come into inevitable conflict with the great houses of Bourbon and Châtillon, and at the same time the Guises set themselves up as intolerant champions of the old religion. The consequence was that the political and religious elements of opposition coalesced. The Protestants found leaders in Condé and Coligny, who adopted their faith, and the latter of whom honored it by a signally pure and elevated career. Anthony of Navarre first espoused, but finally deserted, the Protestant cause. His heroic wife, Jeanne d'Albret, the mother of Henry IV., was their steadfast defender. The history of the Reformation in France would include a full narrative of the civil wars. The edict of St.-Germain in 1562 granted a measure of toleration to the Huguenots; but the massacre of Vassy shortly after opened the long and bloody struggle which went on, with intervals of peace, down to the accession of Henry IV. and the Edict of Nantes (1598). The massacre of St. Bartholomew in 1572, when Coligny and thousands of his co-religionists were slaughtered, was due to Catherine de Médicis as its main contriver, and sprang out of the mingled motives of political, religious, and personal hostility. The Huguenots were always a minority of the nation, but, besides the nobles who were attached to their side, they comprised a multitude of the sober and intelligent middle classes and of the inhabitants of towns. The Edict of Nantes, following upon the abjuration of Henry IV., reduced them to the condition of a stationary or declining party, but one furnished as a means of defense with political privileges of an extraordinary character, which they continued to hold until the time of Richelieu. There were times in the course of the sixteenth century when the Protestant cause seemed likely to triumph in France. Its failure to achieve the victory in that country was the tragic event of the Reformation.

VIII. *The Reformation in the Netherlands.*—The inhabitants of the Low Countries were highly prosperous and intelligent. The contiguity of the country to Germany and France facilitated the incoming of Protestant opinions. Merchants and emigrants brought them over from England. In 1523 two persons were put to death at Brussels as heretics—an event that called forth a stirring hymn from the pen of Luther. The persecuting edicts of Charles V. led to the destruction of a great number of Protestants in the Netherlands. Grotius makes the whole number who perished in this reign 100,000—probably an exaggerated estimate. Philip II., who was unpopular in this part of his dominions, set about the strict enforcement of the laws against heresy. The cruelties of the Inquisition, in connection with the evident purpose to destroy the liberties of the country and subject it to Spanish absolutism, provoked armed resistance. The hero of the great revolt, which was a struggle for political and religious freedom, was William of Orange. In the course of the protracted conflict a Protestant state grew up in the north under the lead of Orange, while the southern provinces finally submitted to Spain and retained the old form of religion. The Dutch republic confronted the whole power of Spain and achieved its independence. At first, Lutheranism had been

introduced into Holland, but the Calvinistic type of doctrine and polity prevailed, and was incorporated in the ecclesiastical institutions of the country. The *Confessio Belgica* was composed in 1561, and was revised and adopted by a synod at Antwerp in 1566.

IX. *The Reformation in England and Scotland.*—The Lollards, a remnant of the followers of Wickliffe, were numerous in England at the beginning of the sixteenth century among the lower classes. The revival of learning prepared the ground for ecclesiastical change. The friends of the "new learning" had a spirited contest with the devotees of scholasticism. More, Colet, and Erasmus during his stay in England, exerted themselves in behalf of letters and against superstition. The writings of Luther found readers, especially among young men at the universities. Tyndale's translation of the Bible was eagerly perused, notwithstanding the efforts of the authorities to suppress it, and the martyrdom of its author. The Reformation in England had two distinct sources, which at times worked in conjunction with one another. The first was the moral and religious feeling, which was enlisted in favor of the Protestant movement. The second was the *quasi* political opposition to the foreign rule of the papacy, which was reinforced by the difficulties encountered by Henry VIII. in attempting to procure a divorce from Catharine of Aragon. The reluctance of Clement VII. to comply with the king's petition moved Henry to reduce the power of the clergy and to oblige them to declare him the head of the Church of England. Finally, he cut the knot by marrying Anne Boleyn without the papal permission in 1532. This was followed by the Act of Supremacy, which put an end to papal authority in England. In 1536 followed the act for abolishing the monasteries and confiscating their property. The king still professed the Catholic dogmas. There was a Protestant and a Catholic party in the Church, the leader of the former being Cranmer, Archbishop of Canterbury, a man of pure and upright intentions, but of a timid nature. The Protestants were led in the council by Thomas Cromwell, the king's vicegerent in ecclesiastical affairs. The Ten Articles (1536) were, on the whole, favorable to the Protestant side; but the bitter matrimonial experiences of the king, taken in connection with the Catholic rebellion in the North, led to the issuing of the Six Articles (1539), which were more in the Roman Catholic interest; and the same circumstances caused the fall of Cromwell (1540). Cranmer was saved from the vengeance of the opposing faction by the king's personal favor. On the death of Henry VIII. and the accession of young Edward VI. (1547) the Protestant party obtained complete control. In his brief reign, under the auspices of Cranmer and his associates, the Protestant Church of England received its constitution, liturgy, and creed. Evangelical theologians from the Continent filled the chairs of theology in the universities. Under Mary (1553–58), the successor of Edward, the old order of things, the papal supremacy included, was restored. Her matrimonial connection with Philip II. and subservience to Spain, and the popular sympathy excited by the martyrdom of Cranmer, Ridley, Latimer, and others, prepared the nation for the restoration of Protestantism under the auspices of Elizabeth, in 1558. During her long reign the Protestant religion took firm root in English soil. The defeat of the Spanish Armada (1588) rendered it certain that the authority of the papacy could not be reinstated by foreign intervention. The conservatism of Elizabeth in matters of religion provoked into activity the Puritan sentiment, which was anxious to assimilate English Protestantism to that of the Continent, where numerous English exiles had lived during the preceding reign. The Puritans likewise demanded a greater independence for the Church in relation to the state than the Tudor love of power and a widespread feeling of repugnance to ecclesiastical control would allow. The result was the division of the Church of England into two great parties whose contests fill many a page of English history for the century that followed the accession of Elizabeth.

In Scotland, at the outbreaking of the Reformation, the clergy were ignorant and vicious, and the Church was in possession of a great portion of the landed property of the kingdom. The evangelical doctrine, of which John Knox was the most effective apostle, gained a lodgment in the hearts of the people, and the co-operation of the nobles was founded partly in religious conviction and partly in the desire to appropriate to themselves the property of the Church. Protestantism in the Calvinistic and Presbyterian

The Reformed Church in the U. S. publishes 29 periodicals, of which 23 are English and 6 German. It is actively engaged in the work of missions, and has been especially interested in the evangelization of Japan. In the U. S. it has found an extensive field for missionary labor among immigrants from Germany and Switzerland. Several Hungarian churches have recently been founded. The Church sustains four orphanages and a home for deaconesses.

The following are the statistics for 1894: Synods, 8; classes, 55; ministers, 938; congregations, 1,646; communicant members, 221,473; benevolent contributions, \$257,947. See PRESBYTERIAN CHURCH. JOSEPH HENRY DUBBS.

**Reformed Church of America:** a religious denomination known prior to 1867 as the Reformed Protestant Dutch Church in North America, a name which exactly described it, as *Protestant vs. Roman*; *Reformed*—i. e. Calvinistic in doctrine and non-prelatical in order; *Dutch*, as descended from Holland and inheriting its religious type.

1. *Origin and History.*—The first settlers in New Amsterdam brought with them the schoolmaster and the visitor of the sick, and in 1628 a church organization was formed. The emigration from Holland followed the Raritan, the Hudson, and the Mohawk rivers and their affluents, and at first was considerable, but after the English conquest in 1664 fell off rapidly. Still, the Hollanders held the ground they had taken, and everywhere multiplied ministers and churches. Their subsequent growth was hindered by three great causes—too great tardiness in relinquishing the Dutch language in public worship; a bitter controversy among themselves on the question whether they should act independently of the mother-Church in supplying their pulpits; and the waste of the Revolutionary war, whose chief scenes of conflict in the Middle States lay in the territory occupied by the Dutch; but after the return of peace the denomination consolidated its institutions and set to work repairing the desolations of the past. It increased its funds for educational purposes, enlarged its corps of theological professors, prosecuted in various directions missionary enterprises at home, and also engaged in the same work abroad—at first, in connection with other denominations, afterward independently. It numbers (1894) 612 churches, 614 ministers, and over 100,000 communicants, who are organized into 34 classes, 4 particular synods, and 1 general synod. The strength of the denomination lies at the East, but seven classes have been formed among the many thousands of Hollanders who have settled in various Western States from Michigan and Illinois to the Dakotas.

2. *Doctrine and Worship.*—The Church is eminently confessional. It owns five creeds—the Apostles', the Nicene, the (so-called) Athanasian, the Belgic Confession, and the Canons of Dordrecht. It requires the Heidelberg Catechism to be taught in families and schools, and also to be regularly explained from the pulpit on the Lord's Day. A short compendium of this catechism is the standard of doctrine for all who seek full communion; and ministers are required to pledge themselves in writing not to promulgate any change of views they may make without previously consulting the classis to which they belong. There is a Liturgy, which is mostly optional, but the forms for the administration of the sacraments, of ordination, and of church discipline are of imperative obligation. No psalmody may be used unless it has been approved by the General Synod.

3. *Polity.*—The affairs of each congregation are managed by a consistory, consisting of elders and deacons chosen for two years, but in such a way that only half go out of office at once. The elders, with the pastor, receive and dismiss members and exercise discipline; the deacons have charge of the alms. Both together are trustees of the church, hold its property, and call its minister. Ex-members of this body constitute what is called the "great consistory," who may be summoned to give advice when necessary. The minister and one elder from each congregation in a certain district constitute a classis, which supervises spiritual matters in that district. Four ministers and four elders from each classis in a larger district make a particular synod, with similar powers, and representatives from each classis, proportioned in numbers to the size of the classis, constitute the General Synod, which has supervision of the whole, and is a court of the last resort in judicial cases.

*Educational and other Institutions.*—Rutgers College (1770), New Jersey, Hope College (1865), Michigan, Northwestern Academy, Orange City, Ia. (1883), and Pleasant Prairie College, German Valley, Ill. (1893), are controlled by

members of this Church, but are unsectarian in teaching and influence. The chief theological seminary, at New Brunswick, N. J., has five professors and a library of over 40,000 volumes. There are two others—one at Holland, Mich., the other at Palmaner, India—each with three professors and a respectable library. Foreign missions are maintained in Japan, China (Amoy), India (Madura), and Arabia. There are 23 ordained missionaries, 55 churches, 6,226 communicants, and an annual outlay of about \$112,000. The board of domestic missions aids in sustaining over 150 churches and expends about \$65,000 yearly. The board of education aids over 100 students in preparing for the ministry and expends \$30,000 yearly. A board of publication, organized in 1854, besides other good work, issues two monthly journals. The salient characteristics of the Church are zeal for doctrine, order, and a learned ministry, unyielding attachment to its own views and usages, and a large charity for all other Christians.

**Reformed Church of Scotland:** See SCOTLAND, CHURCH OF.

**Reformed Episcopal Church:** a religious body founded Dec. 2, 1873, by a few clergymen and laymen who left the Protestant Episcopal Church of the U. S. under the leadership of the Right Rev. George David Cummins, D. D. Unwilling longer to share responsibility for what he believed to be the Romeward tendencies of that church, he resigned his bishopric in it, and was chosen the first presiding bishop of the new Church under the following resolution: "That we, whose names are appended to the call for this meeting as presented by Bishop Cummins, do here and now, in humble reliance upon Almighty God, organize ourselves into a Church, to be known by the style and title of 'The Reformed Episcopal Church,' in conformity with the following declaration of principles, and with the Right Rev. George David Cummins, D. D., as our presiding bishop:

"I. The Reformed Episcopal Church, holding 'the faith once delivered unto the saints,' declares its belief in the Holy Scriptures of the Old and New Testaments, as the Word of God, and the sole rule of faith and practice; in the creed 'commonly called the Apostles' Creed'; in the divine institution of the sacraments of baptism and the Lord's Supper; and in the doctrines of grace substantially as they are set forth in the Thirty-nine Articles of Religion.

"II. This Church recognizes and adheres to episcopacy, not as of divine right, but as a very ancient and desirable form of Church polity.

"III. This Church, retaining a liturgy which shall not be imperative or repressive of freedom in prayer, accepts the Book of Common Prayer as it was revised, proposed, and recommended for use by the General Convention of the Protestant Episcopal Church, A. D. 1785, reserving full liberty to alter, abridge, enlarge, and amend the same, as may seem most conducive to the edification of the people, 'provided that the substance of the faith be kept entire.'

"IV. This Church condemns and rejects the following erroneous and strange doctrines as contrary to God's Word:

"(1) That the Church of Christ exists only in one order or form of ecclesiastical polity.

"(2) That Christian ministers are 'priests' in another sense than that in which all believers are 'a royal priesthood.'

"(3) That the Lord's Table is an altar on which the oblation of the body and blood of Christ is offered anew to the Father.

"(4) That the presence of Christ in the Lord's Supper is a presence in the elements of bread and wine.

"(5) That regeneration is inseparably connected with baptism."

At its General Council in New York in May, 1874, it revised the Prayer-book of 1785 to meet the needs of the changed times, but without making any variations of principles or doctrines. The use of the Prayer-book was made obligatory at Sunday morning services and optional at other times. At the same time it adopted its first constitution and canons. At its third General Council at Chicago a year later it adopted its Articles of Religion, based substantially upon the Thirty-nine Articles of the Church of England.

The Reformed Episcopal Church is governed by a general council, its president being the presiding bishop for the time being, meeting annually, biennially, or triennially.

1. PARA 12. NÚMERO

Hickman, W. J. 1961.

**Deflection** (from Lat. *deflecto*, *deflexum*, bend up, bend down, deflect, etc., contra *deflexio*, break, fling, etc.) the change of direction in flight toward lower and away from the front into midline into midline.

... the ... a ... of it is ... of the ...  
... the ... of the ... the ...

and at the point of entrance he is after these entering a straight path (Fig. 3). The first medium is air. In the air the ray of refraction from  $P$  to  $A$  enters the eye. But the density increases in the medium through which travels the light from there. The straight path from the light source to the eye is protracted by bending, and the amount of the bending is proportional for each ray to the distance between  $P$  and the eye. This is the principle of least time, which is the basis of Fermat's law. If  $H$  and  $A$  be two opposite surfaces of a refractive medium of density  $\mu$  and  $\mu'$ . An object  $P$  of perpendicular distance  $H$  from  $A$  and for the incident ray  $PA$  meet  $M$  in  $A$ . The condition holds if  $A$  is a distant object then the distance of the ray  $PA$  is least and  $A$  is  $Q$  the point  $P$  is  $E$  the refracted ray  $PA$  in the region of refraction. And  $\mu' \sin E$  the angle of refraction. To determine the refractive index of the medium about  $E$  we can say that the  $\mu'$  is a function of  $\mu$  at the point  $E$  and is derived from  $\mu$  by  $M$  and  $N$ , from  $\mu$  by  $\mu'$  parallel to  $MA$  and  $NS$  perpendicular to  $PA$ . At  $E$  the angle of refraction is  $\mu'$  and  $\mu$  is the angle of incidence. The law of refraction, called Snell's law, is that for such refracting medium the sine of the angle is proportional to each other as the refractive index, while the incident ray, refracted rays and the normal lie in one plane. The index of refraction is the numerical ratio existing for the ratio of the sines. When a light ray passes from air into water the refractive index of the water is very nearly that of 4 to 3. The refractive index is denoted in this case, expressed by the function  $\mu$ , or more exactly by the constant  $\mu_0$ . Experiment shows that if the ray passes from the more refractive medium, water, into the less refractive, air, the direction will be bent the amount  $P'Q$ , and the refractive index will be nearly 4, or more exactly by the constant  $\mu_0$ . The ray in entering the more refractive medium is bent toward the normal, and in entering the less refractive medium is bent from the normal to the same amount. The ray and therefore always, except by the path of the arrival, the refractive index being in the one case the reciprocal of what it is in the other.

In looking at the figure, it will be seen that any ray, however oblique, which falls upon A from the air above will be refracted toward P Q. This process is not, however, infinitely true. If a ray passes upward through the water at certain angles refraction is impossible. Let the ray G C, following the law of the snail, just prove the surface of the water B A after being refracted from P Q, then any ray which enters the water between G and I from the direction F, is F' C, can not be refracted, for the point after bending at its proper angle would be within the water, when no change of direction would be possible. The rays which can not be refracted are therefore totally reflected. The critical angle is where total reflection begins to predominate, and that the same equals the complement of the index of refraction. Total reflection at times causes the bottoms of very shallow ponds to be invisible to an eye at a certain angle from them. Every ray of scattered light, by which objects upon the bottom, would become visible, reaches the surface of the water at an angle of total reflection and are all energy, and is turned downward again.

The variation in the refractive indices of different media shows that bodies have different capacities of receiving light through their bounding surfaces. This fact, according to the wave theory, results from the slower propagation of the vibrations of the vibrations in the denser medium. Optical density, however, does not necessarily coincide with density of mass. Brazilplate of carbon ( $C_2$ ) is lighter than crown glass, but has a greater index of refraction for each kind of light. The velocity of propagation varies inversely as the refractive index, and it is an important mathematical property of the propagation of light that, when a ray passes from one point to another through any number of different media, the time of transmission between the two points is the least possible.

From the law of refraction it is manifest that when a ray passes through a medium with parallel faces, as a pane of window-glass, its course after emergence is parallel to the original direction. All the rays which go to make up the image upon the eye of an object so viewed, therefore, assume their relative positions, and the proportions are perfect, though the whole object is slightly displaced, the amount of displacement being dependent upon the thickness of the glass. An object viewed through imperfect glass, where the faces are not strictly parallel, and its proper axis altered, because the emergent rays which go to form it are not parallel, but diverge, or converge, or cross each other, at one or more of angles. It will be found that the distortion in

comes more striking as the eye recedes from the glass, the divergencies being more noticeable at a distance. Most optical instruments are dependent upon refraction, and are constructed in accordance with its laws. See **ABERRATION, LENS, MICROSCOPE, and TELESCOPE**. For the different refrangibilities of each colored ray in the spectrum, see **ABERRATION, INTERFERENCE, LENS, LIQUIDS, SPECTRUM**. For the history of discovery, see **OPTICS**. Revised by R. A. ROBERTS.

**Double Refraction.**—That particular case of refraction in which a ray of light on entering a medium is divided into two rays. One of these, called the ordinary ray, is propagated in accordance with Snell's law. The other, called the extraordinary ray, is propagated in accordance with a much more complex law, which was first shown by Huyghens in 1690 to be a necessary consequence of the assumption that the luminiferous ether in the medium is unequally elastic in two directions, each perpendicular to the other. The phenomena of double refraction are seen to the best advantage in the mineral calcite, a crystalline variety of calcium carbonate. (See **OPTICS**.) In other double refracting bodies the separation of the two rays is not wide enough to be easily perceptible, but by special contrivances (see **POLARIZATION**) they may be made to interfere, and many of the most brilliant color effects are thus attained. By such means it has been ascertained that the property of double refraction is exceedingly common in transparent media, being absent only from those homogeneous bodies which are uniform in density, non-crystalline, or isometrically crystallized. (See **CRYSTALLOGRAPHY and MINERALOGY**.) The two beams are always polarized, the plane of polarization of one being perpendicular to that of the other, except in the case when they coincide in the direction of the principal optical axis of the crystal. In calcite this direction is equally inclined to the three faces whose intersection forms an obtuse trihedral angle. The widest separation of beams is in a plane perpendicular to this axial direction. Under this special condition each ray is propagated in accordance with Snell's law, the index of refraction of the ordinary ray being 1.658 for monochromatic yellow light (D line), while that of the extraordinary ray is 1.486. Since the velocity of propagation varies inversely as the index of refraction, the velocity of the ordinary ray is not quite nine-tenths of that of the extraordinary at maximum separation. In the case of quartz under similar conditions the velocity of the ordinary ray slightly exceeds that of the extraordinary. On this basis double refracting crystals are divided into two classes, negative and positive, calcite being a typical example of the negative and quartz of the positive. Calcite and quartz, moreover, have each but a single axis, along which there is no double refraction, while in many other crystals, such as niter, there are two such directions. On this basis, therefore, crystals are still further divided into two classes—uniaxial and biaxial. It was shown by Fresnel that in transmission through biaxial crystals both rays fail to meet the requirements of Snell's law; each therefore may be properly called extraordinary. In certain varieties of mineral, such as mica, some specimens are found to be uniaxial and others biaxial.

For Huyghens's determination of the direction of either ray in a double refracting medium, see **POLARIZATION**.

**Index of Refraction.**—The constant ratio of the sine of the angle of incidence to the sine of the angle of refraction when a ray of homogeneous light passes through the bounding surface between two media. Thus if a ray of monochromatic yellow light (D line) at a temperature of 15°C. pass from a vacuum into water at an incident angle of 60°, the angle of refraction will be found to be 40° 20'. The index of refraction,  $n$ , under these conditions is

$$n = \frac{\sin 60^\circ 00'}{\sin 40^\circ 20'} = 1.3339.$$

If the first of these media be air instead of a vacuum, since the index of refraction of air is 1.000294, the relative index of refraction of water with respect to air is found by dividing the former result by the latter, giving 1.3335. Since ordinary measurements are made in air rather than in a vacuum the refractive index referred to a vacuum is usually called the absolute index by way of distinction.

The index of refraction affords a convenient means of comparing the refracting powers of different media. For the indices of refraction of different kinds of glass and several liquids, see **LENS and LIQUIDS**. For a full table of refractive indices for various media, the reader is referred to Landolt and Börnstein's *Physikalisch-Chemische Tabellen* 2d ed., pp. 384 to 447. W. LE CONTE STEVENS.

**REFRACTION OF SOUND.**—The change in direction of sound-waves on passing from one medium into another. A beam of sound—regarded as any very small segment of an advancing spherical wave-front—moves normally in a radial line, but it is bent from its rectilinear course whenever it undergoes an unequal acceleration or retardation, necessarily turning toward the side of least velocity and from the side of greatest velocity. In other words, the direction of acoustic impulse is always perpendicular to the wave-front of sound, whether it continues as an expanding spherical surface, or, by reason of unequal velocity, becomes in any way deformed.

There are four ways in which sound-waves may be subjected to an unequal disturbance of velocity, and the sound-beams become thereby refracted: 1. By variation of *elasticity* in the medium. If the density be unchanged, the velocity of sound varies directly as the square root of the elasticity. 2. By variation of *density* in the medium. If the elasticity remain unchanged, the velocity varies inversely as the square root of the density. 3. By variation of motion, or *current*, in the medium. Sound traveling with the wind is propagated a little more rapidly than against the wind. 4. By variation of *temperature* in the medium. If other elements remain unchanged, the velocity of sound in air varies directly as the square root of the absolute temperature. The effect of heat on a gas is to increase its elasticity if confined, and to diminish its density if unconfined; in either case equally it accelerates the velocity of propagation.

(1) Perhaps the only practical example of acoustic refraction by differences of *elasticity* is furnished by the passage of sound from water into air or from air into water. Sound moves more swiftly through liquids (and still more so through solids), not in consequence of their greater density, but in opposition to their density, and by virtue of their far greater energy of resilience or elasticity, measured in intensity, not in quantity. The concentric sound-waves sent upward by a submarine explosion to the level surface of the water there suffer a large amount of internal reflection, with a reverse curvature, giving the sound-beams the same amount of divergence downward that they previously had upward. A portion of each of the sound-waves, however (with greatly diminished amplitude of vibration), is propagated into the air. These have their convex fronts very much flattened, by reason of being reduced to less than one-fourth of their previous velocity. The radii of these deformed surfaces, representing the directions of the sound-rays, are thus bent or refracted upward (or toward the vertical) at the surface of the air, and have a focus of divergence much more distant than the position of the origin of the sound-waves. In the case of an aerial sound, as the discharge of a gun, the descending sound-waves are largely reflected upward from the surface of the water; but a small portion of the impulse passing this plane, the convex wave-fronts, acquiring suddenly more than four times their previous velocity, are hurried into greatly increased convexity, and the sound-rays are refracted toward the horizon, with a divergence representing a much lower or nearer focus than the origin of the sound. Those sound-rays which by refraction would coincide with the horizontal plane or water-surface would necessarily suffer total reflection.

(2) The refraction of sound resulting from differences of *density* was first demonstrated by Carl Sondhauss in 1852 by means of a convex lens of carbonic-acid gas confined in an envelope of collodion film. The ticking of a watch was heard, with the lens interposed, most distinctly at a focal point where it could not be heard on the removal of the lens. (*Poggendorfs Annalen*, 1852, lxxxv., 381.) In this case the wave-front on entering the convex surface of the lens is so far retarded by the denser gas (commencing at the axis of the lens) as to have a concave form impressed upon it, and on emerging from the second surface of the lens in reversed order becomes still more concave by being accelerated first at the outer annulus. The normals of these concave waves converge to a focal point.

(3) The refraction of sound by inequality of *wind* was first suggested by Prof. Stokes in 1857. Winds, being ordinarily more retarded near the earth than aloft, would act unequally upon the concentric sound-waves advancing against them, by retarding the upper portion of the wave-fronts more than the lower portion. Being thus tilted backward more and more as they advanced against the wind, these wave-fronts would have their lines of impulse, representing the acoustic beams, bent gradually upward from the surface, so as to leave a sound-shadow at no great distance on a plane. **Self-organizing Processes:** the means of producing an order in the members for the purpose of ending the same and thus forming a new organization below that of their mother organization. Such processes found in the animal

**Compressing-Expanding Pump Circulation.**—Fig. 1 illustrates the essential features of a compressing-expanding for a cold-water circulation. It is a gas compressing pump, driven by any form of steam engine. E is a coil of pipe connecting with the outlet from the compressing pump, which is kept discharging at intermittent with cold water at about 60° F., penetrating the condenser. A is a closed tank communicating with this coil, from the condenser, constituting the liquid submergence vessel. C is a coil of pipe discharging at a bath of water or other fluid, non-compressible at the lowest tested temperature, constituting the cooler. The end of this coil of pipe connects with the reservoir B, the source of a vapor, B formed the expansion tank and the other end connects with the inlet, or suction end, of the compressing pump. It represents cold-water circulation as shown has been installed with water, while it is known to maintain a low temperature by circulating cold water through the coils of pipe E. This is accomplished by means of the brine-pump F, which draws brine from the bottom of the bath, and forces it through the pipes G, whence it returns to the top of the bath, or reservoir.

The operation of the apparatus is that as follows. The apparatus, having closed, a tank of liquid ammonia maintained at constant low pressure is discharged into the cooler, and the compressing pump is operated so as to prevent the accumulation of more than the desired pressure—say, 19 lb. above the atmosphere—in the cooler. The tank of liquid anhydrous ammonia in the condenser in which it is received from the manufacturing chemist is at the temperature of the atmosphere—say 70° F. As the compressor has suction on the tank, as a liquid only when it is under a pressure of about 110 lb. per square inch above the atmosphere. The ammonia then too flows from the tank into the cooler, but in the latter the pressure is only 19 lb., and at this pressure the ammonia can not exist as a liquid unless its temperature is about 5° F., which is the boiling-point corresponding to the pressure. Hence, as the temperature on entering the cooler is about 70°, it is in the condition of a liquid heated above the boiling-point due to its pressure. Vaporization will therefore occur until the latent heat of the portion vaporized equals the heat represented by the difference between 70 and 5°, when the ammonia will have

But...

The authors wish to thank a variety of the following individuals: (1) A. J. Reed, for the initial polymeric hydrochloride of acrylamide; (2) the staff of the

cool itself to the latter temperature. About 10 per cent. of the weight of ammonia will thus evaporate as a consequence of the fall of temperature, or, in technical terms, 10 per cent. of the ammonia is evaporized by free exposure.

sion. Ninety per cent. of the ammonia is therefore in the liquid state when it has attained the temperature of ebullition corresponding to the pressure existing in the cooler, and if no heat could be supplied from surrounding bodies it would remain liquid; but it is practically in direct contact with the brine, whose temperature is so much higher than that of the ammonia that the latter must receive heat from the brine, and, as the compression-pump by its suction prevents the pressure in the cooler from increasing, the effect of the heat received will be to evaporate the liquid ammonia without increasing its temperature. The brine may therefore be cooled by an amount equivalent to the latent heat of 90 per cent. of the total ammonia introduced into the cooler. All of the ammonia is not, however, allowed to vaporize in the cooler in some types of compression-machines, while in other systems particular care is taken to insure its complete vaporization. This difference of treatment gives rise to two classes of apparatus, one known as the wet or cold compression and the other the dry-compression type. In either case all of the ammonia is drawn into the compressing-pump, which forces it into the condenser, where sufficient ammonia is gradually accumulated to cause the pressure to equal that at which it will be liquefied, by means of the cooling water with which the condenser is supplied. When a sufficient amount has liquefied to fill the reservoir A to the desired extent, as shown by a gauge-glass attached to it, the charging of fresh ammonia to the cooler is discontinued, and the expansion-cock B is opened so that liquid ammonia flows into the cooler from the reservoir A at the same rate as the latter receives ammonia from the condenser. This ammonia undergoes free expansion and evaporation in the cooler, and the operations are then continuous, the temperature of the brine gradually approaching that corresponding to the boiling-point of ammonia at the pressure maintained in the cooler by the suction of the pump. When the desired brine temperature is reached its circulation through the cold-storage rooms is commenced. Generally the brine returns to the tank, after passing through the storage-rooms, at about 6° higher temperature than that at which it leaves the tank, and its mean temperature is from 6° to 16° higher than the boiling-point of the ammonia corresponding to the suction-pressure, according to the efficiency and extent of the pipe-surface in the brine-tank. The mean temperature of the brine is about 6° less than that of the storage-space required to be cooled. For the storage of beer a temperature of about 36° F. is required, and this is therefore afforded with a pressure of about 28 lb. above the atmosphere in the cooler. Slaughter-houses require about 25° F. in their storage-rooms, which may be afforded by about 24 lb. suction or cooler pressure; while for the storage of fish, requiring a temperature of about 0° F., a suction-pressure of about 5 lb. above the atmosphere must be used.

**Air and Chloride of Calcium Circulating Systems.**—Instead of brine chloride of calcium is used as a circulating medium, first, because the corrosion of iron pipes is thought to be less by its use than with brine, and, second, because at temperatures approaching 0° F. brine, unless made from the best qualities of rock-salt, is liable to partly congeal, whereas chloride of calcium is perfectly fluid at temperatures considerably below zero. In cold-storage practice at Boston air from centrifugal fans is blown over the surfaces of the cooler, and by a system of wooden conduits is circulated through storage-chambers. Pipes in the storage-chambers are thus avoided. The expenses of such a system are possibly a little greater than that of a brine system, but by its use a storage-chamber freshly filled with material can be more quickly cooled to a given temperature than by either a brine or a direct-expansion system.

**Direct-expansion Compression Systems.**—If instead of using cold brine in the pipes in the storage-chambers the liquid ammonia is circulated through them, we have what is called a direct-expansion system. The storage-chamber piping then constitutes the cooler. If it is desired to refrigerate spaces at long distances from the compressor, this system is necessary, as the liquid ammonia from the condenser can be conveyed to an expansion-cock at any point without the expensive insulation necessary on conduits for cold brine. In St. Louis and Denver, for example, areas of half a mile radius are successfully refrigerated by ammonia conveyed in underground pipes. Where, however, the refrigeration is confined to a part of a building near by or containing the compressor, the use of brine is by many regarded as a desirable safeguard against damage of stored

material by the accidental escape of ammonia from the circulating pipes, notwithstanding the fact that the cost for piping is less for the direct-expansion system, and that it saves in cost of operation to the extent of most of the power consumed by the brine-circulating pump, and by permitting the suction-pressure to be from 5 to 10 lb. higher to secure a given temperature in a storage-space than is possible with brine as a medium of transmission between the ammonia and the material to be cooled.

**"Wet" versus "Dry" Compression System.**—In the wet system, which is known also as the Linde system, the presence of some liquid ammonia in the compression-cylinder limits the highest temperature in the latter to about the boiling-point, corresponding to the highest pressure produced by compression, whereas with the dry system the maximum temperature in the compressing-cylinder is upward of 100° F. higher. If the compressing-cylinder was absolutely non-conducting, the wet process should be more economical than the dry method, but the influence of the cylinder-walls appears, by tests, to make the two systems practically equal in economy. See the table near the end of this article.

**Ammonia-absorption System.**—If instead of being drawn into the compressing-pump the ammonia gas leaving the cooler is led into contact with hydrate of ammonia surrounded by a bath of cooling water, it may be dissolved or absorbed by the hydrate as rapidly as it would enter the cylinder of a compressing-pump. The resulting hydrate of ammonia being then withdrawn by an ordinary pump from the vessel, called the absorber, in which the absorption has occurred, and forced into a still or closed vessel containing a steam-coil, the ammonia absorbed may be distilled from the hydrate as a gas at the same pressure which could be given it by the compressing-pump—that is, the liquefying pressure corresponding to the temperature of the cooling water available for the condenser, the hydrate resulting from the distillation being meanwhile returned to the absorber to react upon more gas from the cooler. The distilled gas being led to a condenser produces liquefied anhydrous ammonia, which can be used through an expansion-cock and cooler like that coming from a condenser of a compression system. Such a series of operations constitutes the ammonia-absorption system. In other words, for the compressing-pump, with its steam-engine in a compression system, there is substituted a vessel called an absorber, a common liquid-pump, and a steam-still. All the other elements, namely, the condenser, liquid-ammonia reservoir, expansion-cock, and cooler, Fig. 1, are identical for the two systems.

A section of a leading absorption refrigerating-machine is given in Fig. 2. G is the still or generator containing the steam-coil c, which is supplied with steam by pipe e and drained by a steam-trap, f. The distilled gas leaves the generator at J after passing over the baffle, or separating-plates K, to be freed of entrained water. It then passes to the condenser E, which is in two sections, arranged so that water-vapor condensed in the part L can be drained back to the generator. The hydrate or weak liquor resulting from the distillation sinks by its increase of specific gravity to the bottom of the generator, and thence passes by the pipe a to the absorber D to reunite with gas entering the latter by the pipe d from the cooler C. Simultaneously the recharged hydrate or strong liquor from the absorber is delivered to the generator by the pump P and pipe e. In the vessel called the interchanger the weak liquor at about 270° gives up heat to the strong liquor, which leaves the absorber at about 130°. The cooling water which is supplied to the condenser E acts afterward to cool the absorber, the chemical union of the gas and weak liquor being accompanied with generation of heat. A is the liquid-ammonia reservoir, B the expansion-cock, and C the cooler and brine-tank.

All the above remarks regarding the brine, chloride of calcium, air, or the direct-expansion methods of circulation apply as well to the absorption as to the compression system.

**Ammonia Compression versus Absorption System.**—If a compression system is driven by an ordinary non-condensing Corliss engine affording an indicated horse-power with 3 lb. of fuel, tests of performance show that its economy of fuel is about equal to the best absorption systems when the efficiency of the boiler is equivalent to the evaporation of 11.1 lb. of water per pound of combustible from and at 212° F., and the suction-pressure is about 20 lb. above the atmosphere—that is, when the temperature of the material to be refrigerated is required to be about 20° F. For higher temperatures or higher suction-pressures the compression-machine is superior in economy of fuel, but for lower tempera-

The absorption principle described above can be applied with water or brine as the refrigerating substance, and sulphuric acid as the absorbent. The water or brine is fed into a chamber or cooler in which a vacuum of about .16 inch of mercury, or less, is maintained by an air-pump. A portion of the liquid evaporates by free expansion, and temperatures

as improbable, and making use only of Fourier's mathematical theory of heat has arrived at some important results. He assumes that at a certain critical epoch a superficial layer of rocks became solidified, at a temperature of about 7,000° F., and shows that it is probable that the amount of heat of the crust went on diminishing by a quantity pro-

\* Temperature of air at entrance and exit of expansion-cylinder.

as low as 32° are produced with water, or as low as 14° with brine. The unevaporated liquid is frozen to ice if it is water, or circulated through the spaces to be refrigerated if it is brine. The vapor is drawn into a vessel or acid-chamber, adjoining the cooler, containing anhydrous sulphuric acid, which absorbs it. The resulting mixture, or dilute acid, is pumped into the still or generator, which frees it of water, and it is then returned to the acid-chamber to reabsorb the vapor. Experiments with the apparatus on a small scale indicate that the economy of the process for general refrigerating purposes may be superior to that in which ammonia is used, and that it may afford a means of making ice with considerably less expense and space for plant than by the use of any other of the refrigerating substances. This method is employed in one of the oldest forms of refrigerating-machines, where, by means of a hand-pump, a vacuum is produced in a glass bottle or caraffe filled with water, and ice is formed inside the bottle for table use. One-fourth of the water is vaporized and absorbed by sulphuric acid or other substances having a strong affinity for water, and the remaining three-fourths is converted into ice. D. S. JACOBUS.

**Refrigeration of the Earth:** the gradual cooling of the earth in the course of ages. According to the NEBULAR HYPOTHESIS (q. v.) the earth was originally a mass of fiery liquid, and known geological facts have established that its surface was at one period much hotter than it is now. The fact that the temperature increases from the surface inward implies that there is a continual loss of heat from the interior by gradual conduction through the outer crust and atmosphere to external space. (See ENERGY, DISSIPATION OF.) This loss is very small, in proportion, compared with that of the sun—owing, doubtless, to the existence of the crust. It has been suggested, however, that the internal heat might be kept up by chemical action—that is, by the transformation of chemical energy of combination into heat, or by the passage of the earth through a hotter region of space, a hypothesis due to Poisson. Lord Kelvin regards these views

portional to the square root of the time from the epoch. Further, his analysis would lead to the inference that during the last 96,000,000 years the rate of increase of the temperature from the surface inward has diminished from about  $\frac{1}{10}$ th to about  $\frac{1}{100}$ th of a degree F. per foot, and that the thickness of the crust through which any degree of state cooling has been experienced has increased up to its present thickness from a fifth of that thickness. Lord Kelvin believes also that the earth is not, as is commonly supposed, a mass of fiery liquid covered with a crust of from 30 to 10 miles thick, but on the whole more rigid than a solid globe of glass, or even of steel of the same dimensions, and he observes that a decided negative should be given to the suggestion that internal heat exerted any sensible effect on climate. See EARTH (Internal Temperatures). R. A. ROBERTS.

**Refuge, Cities of:** See CITIES OF REFUGE.

**Regal'di, GIUSEPPE:** poet; b. at Novara, Italy, in Nov. 1809; began the study of jurisprudence in the University of Turin, but failing in his first examinations, and having heard the improvisatore Giustiniani, he resolved to rival him. From 1833 to 1856 his course was a continual triumph; he improvised in all the principal cities of Italy, in France, in Switzerland, in Germany; visited Greece, Asia Minor, Mt. Lebanon, and Egypt, and there gathered fresh inspirations. In 1860 he was appointed Professor of History in the Lyceum of Parma; then (1862) in the University of Cagliari; and finally, in 1866, in the University of Bologna. D. at Bologna, Feb. 1883. Among his volumes of verse: *La guerra* (1832); *Poesie estemporanee e pensate* (1833); *Canti* (1840); *Canti nazionali* (2 vols., 1841); *La Bibbia* (1852); *Canti e prose* (1861-65); *Poesie scelte* (1874); *L'eroe* (1878). We have also a volume of travels, *Dora* (2d ed. 1881), and a collection of essays, *Storia e letteratura* (1879). F. Orlando, *Giuseppe Regal'di* (1880). Many illustrated French and Italian poets have written verses in his honor, among others Lamartine. Revised by A. R. MARSH.

**Regatta:** See ROWING and YACHTING.

fifth century B. C. it lost its republican organization; after an obstinate resistance it was captured by Dionysius the Elder, tyrant of Syracuse (387 B. C.). Under the Romans it became again wealthy and magnificent. The Castor and Pollux with St. Paul on board entered the harbor (63), and, according to tradition, St. Paul landed and founded a church. The ecclesiastical history of Reggio is interesting and somewhat important. The city shared all the vicissitudes of Southern Italy during the Middle Ages. It was burned by Alaric (410), captured by Totila, King of the Goths (549), by the Saracens (918), by the Pisans (1005), by Robert Guiscard (1080), and by the Ottomans (1552 and 1597). Nevertheless, it was flourishing and opulent when in 1783 it was utterly overthrown by earthquake. Though suffering from earthquakes often since, it has been partially rebuilt and presents a modern appearance with handsome and spacious streets. The city now rises in amphitheatrical form upon a gently sloping hill; its suburbs are attractive and it enjoys splendid sunset views over the strait, with Etna and Sicily in the foreground. It has a few manufactories and an inconsiderable maritime trade. Pop., with the suburban villages (1893), 43,000. E. A. GROSVENOR.

**Reggio nell' Emilia**, red'jō-nel-lā-mee'lē-ā (anc. *Rhegium Lepidi*): city of Italy, in the province of the same name; on the railway between Parma and Modena (see map of Italy, ref. 3-C). It is a walled town, with broad streets, many of which are lined with arcades. Some of the churches are imposing and contain precious objects of art. Over the altar of St. Prospero once stood the *Nativity* of Correggio, known as *La Notte*, now in the Dresden Gallery. Reggio contains a fine cathedral, partly of the twelfth century, a spacious theater, a library with 56,000 volumes, an academy of fine arts, and a museum with the natural historical collection of Spallanzani, born here in 1729. The small house in which Ariosto was born (1474) is still seen. The Asylum for the Insane, outside the town, is one of the best-managed philanthropic establishments in Italy. The origin of the town is uncertain, but it is often mentioned by Latin writers. It was captured by the Goths in 409, was oppressed by the Exarchs of Ravenna, and was rebuilt by Charlemagne in the ninth century. It suffered severely during the Guelph and Ghibelline wars. An independent commonwealth in the twelfth century, during the thirteenth it was prominent in mediæval learning. For several hundred years it was generally ruled by the Este and Austro-Este family, and joined the modern kingdom of Italy in 1859. Now it is the commercial center of a fertile province, carries on a large trade in country products, and has some industries of its own, as manufactures of carriages, brooms, and sailcloth. Pop. 18,634. E. A. GROSVENOR.

**Regiment** [from O. Fr. *regiment*, government, later a regiment of soldiers < Lat. *regimentum*, government, rule, deriv. of *regere*, rule]: a military organization made up of one or more battalions of infantry, squadrons of cavalry, or batteries of artillery. The organization being permanent, its history, records, and traditions become matters of regimental pride and a potent factor in preserving its *esprit de corps*. Regiments are generally designated by numbers; but they frequently have special names, derived from the locality of their enlistment or from some marked service rendered by them.

In the U. S. the infantry regiment is made up of ten companies and varies in strength from about 500 men on a peace footing to about 1,000 men on a war footing. In the more modern organization of the European armies it consists of three, or sometimes four, battalions, of about 1,000 men each on a war footing, reduced to about 600 on a peace footing. The cavalry regiment of the U. S. contains 12 troops, or 6 squadrons, and the artillery regiment 12 batteries. In European armies these numbers vary somewhat widely.

The regiment is commanded by a colonel, or in his absence by its lieutenant-colonel. Each battalion is commanded by a major, and each company by a captain. The regimental staff usually consists of an adjutant, quartermaster, commissary, and surgeon. Some regiments have also a chaplain.

The regiment is the *administrative unit* of the army, the battalion the *tactical unit*, and the company the *unit of combat*. See ARMY. JAMES MERCUR.

**Regina** [Lat., Queen]: town of Assiniboia, Canada, and capital of the Northwest Territories: station on the Canadian Pacific Railway, 357 miles W. of Winnipeg (see map of Canada, ref. 9-G). It contains fine public buildings, and is

the headquarters of the Northwest mounted police. It is well provided with churches and schools, and has the nucleus of a parliamentary library. Pop. 2,500.

**Regiomonta'nus**, JOHANN MÜLLER: astronomer and mathematician; b. at Königsberg in Franconia, June 6, 1436; studied mathematics under Purbach at Vienna, and astronomy at Padua; lived for some time at the court of Matthias Corvinus of Hungary, afterward at Nuremberg, and was invited to Rome in 1474 by Pope Sixtus IV. in order to reform the calendar. D. in Rome, July 6, 1476—some say by the plague, others by assassination at the hands of the sons of George of Trebizond, in whose writings he had pointed out some glaring errors. His *Ephemerides ab Anno 1475-1506* (continued by Bernhard Walther) made him very famous among astronomers. Among his numerous other works are *De Reformatione Calendarii* (1489) and *De Triangulis Omnimodis* (1533). See Alexander Ziegler, *Regiomontanus* (Langensalza, 1874).

**Registration** (of conveyances): See RECORDING.

**Regnard**, rān-yaar', JEAN FRANÇOIS: dramatist; b. in Paris, France, Feb., 1655. Of a wealthy family, he was well educated, and traveled extensively in Italy, Algiers, whither he was taken as captive by pirates in 1678, Scandinavia, Lapland, Germany, Poland, and Hungary. He settled in Paris in 1684, and began first to write for the Théâtre Italien, but after 1696 wrote entirely for the Théâtre Français. He followed Molière, but at a long distance, naturalness and delineation of character being sacrificed to the comic effect, for which his talent was great. *Le Joueur* (1696), *Les Ménéchmes* (1705), imitated from Plautus, and *Le Légataire universel* (1708) are his best-known comedies. D. Sept. 4, 1709. He also wrote an account of his *Voyages* and a partly autobiographical story, *La Provençale*. Editions of his works have been given by Michiels (2 vols., Paris, 1854-55) and Moland (Paris, 1875). A. G. CANFIELD.

**Regnault**, re-nō', ALEXANDRE GEORGES HENRI: historical, genre, and portrait painter; b. in Paris, France, Oct. 30, 1843. Pupil of Montfort, Lamothe, and Cabanel; grand prix de Rome 1866; painted in Italy and Spain 1866-69, and in Africa in 1870. He returned to France and enlisted in the Sixty-ninth Battalion of the National Guard at the outbreak of the war with Germany, and was killed in a skirmish at Buzenval, Jan. 19, 1871. His works are very fine in color and possess qualities of the highest order. Though only twenty-eight years of age at the time of his death, he had already painted a number of important compositions, one of the most famous of which is his equestrian *Portrait of General Prim*, now in the Louvre. In the Louvre also is his *Execution without Judgment—Granada*. In the Museum of Fine Arts, Boston, is a picture entitled *Automedon with the Horses of Achilles*, which, though not one of his most successful works, gives a fair idea of his power as draughtsman and his ability to handle a large canvas with unity of effect. WILLIAM A. COFFIN.

**Regnault**, HENRI VICTOR: physicist and chemist; b. at Aix-la-Chapelle, Germany, July 21, 1810; studied at the École Polytechnique of Paris; was appointed Professor of Chemistry at that school in 1840, in Physics at the Collège de France in 1841; chief engineer of mines in 1847, and director of the porcelain-works of Sèvres in 1854. The first work of his which attracted attention was his *Action de Chlore sur l'Éther chlorhydrique* (1840), but his physical researches, especially concerning heat, gained for him his great reputation. In 1848 he received the Rumford medal from the Royal Society of London for his *Experiments to determine the Laws and the Numerical Data which enter into the Calculation of Steam-engines*. His investigations in verification of the law of Mariotte and Boyle were communicated in vols. xxi. and xxvi. of the *Mémoires de l'Académie des Sciences*. His *Premiers Éléments de Chimie* (1850), an abridgment of his *Cours Élémentaire de Chimie* (1847-48) has been translated into several languages. His work on the practical treatment of steam-engines forms vol. xxi. of the *Mémoires de l'Académie des Sciences*. D. Jan. 19, 1878.

**Regnault**, JEAN BAPTISTE, BARON: painter; b. in Paris, France, Oct. 19, 1754; led for some time a roving life as sailor, and visited Africa and America; entered in 1771 the studio of the painter Bardin, whom he accompanied to Rome; gained in 1774 the great medal for his *Alexander and Diogenes*; became a member of the Academy in 1775, subsequently professor in the School of Art, and stood at the side of David at the head of the French school of paint-

**Reid, THOMAS**: philosopher; b. at Strachan, Kincardineshire, Scotland, Apr. 26, 1710. His father was a minister. He received his first instruction at home and in the parish school of Kincardine. In 1722 he was sent to Marischal College in Aberdeen, where he graduated in 1726, and occupied a position as college librarian and in studying mathematics and philosophy until 1737, when he was appointed minister at New Machar in Aberdeenshire. His parishioners are said to have opposed his appointment very strenuously, and he had so little confidence in his own powers that he never himself composed the sermons which he preached, but used such as were published by English divines, especially Tillotson and Evans. Nevertheless, his life as a minister at New Machar turned out to the satisfaction of all. In 1740 he married, and in 1748 he published his first philosophical essay, *On Quantity*, in the *Transactions* of the Royal Society of London. It was a criticism of the manner in which the mathematical terminology was used at that time in metaphysics and morals, especially by Hutcheson. In 1752 he accepted the position of Professor of Philosophy at King's College, Aberdeen, where he had to teach mathematics, natural philosophy, and moral philosophy; but in 1763 he moved to Glasgow as the successor of Adam Smith in the chair of Moral Philosophy. Here he published his *Inquiry into the Human Mind on the Principle of Common Sense*, in 1764, and read at the meetings of a philosophical society several papers, such as *Examination of Dr. Priestley's Opinion concerning Matter and Mind* and *Physiological Reflections on Muscular Motion*. In 1781, however, he resigned his office in order to devote himself exclusively to philosophical studies, and published *Essays on the Intellectual Powers of Man*, in 1785, and *Essays on the Active Powers of Man*, in 1788. D. Oct. 7, 1796. Originally, he was a disciple of Berkeley, but David Hume's *Treatise upon Human Nature*, published in 1740, showed him at once to what consequences idealism might lead, and roused him to independent speculation. In opposition to Hume's skepticism he tried in his *Inquiry into the Human Mind on the Principle of Common Sense* to establish a series of fundamental truths independent of experience and indisputable as primitive facts of the consciousness. On the Scottish school of philosophy, and more especially on the study of psychology, he exercised a powerful influence. This influence has extended to France (Royer-Collard and Victor Cousin); and to America and the British colonies, nearly all professors of philosophy in colleges for thirty years (1830 to 1860) being followers of Reid in all important respects. See **ENGLISH LITERATURE (Philosophy)**. Revised by W. T. HARRIS.

**Reid, WHITELAW**: journalist; b. near Xenia, O., Oct. 27, 1837; graduated at Miami University in 1856; after acting for a year or more as superintendent of the graded schools at South Charleston, O., bought and edited the *Xenia News*; joined the Republican party at its birth and made political speeches in support of Fremont in 1856; advocated in the *News* the nomination of Abraham Lincoln in 1860; became city editor of the Cincinnati *Gazette*; during the civil war served on the staff of Gen. Morris in West Virginia and later on that of Gen. Rosecrans, and was war correspondent of the *Gazette*, writing over the signature of "Agate"; in 1863 was appointed librarian to the House of Representatives; in 1865 accompanied Chief Justice Salmon P. Chase on a tour of the South, undertaken by the latter at the request of President Johnson for the secret purpose of studying the condition and interests of the white and black races, and published *After the War, a Southern Tour* (Cincinnati, 1866); during the next two years engaged in cotton-planting in Louisiana and Alabama, and published *Ohio in the War* (2 vols., Cincinnati, 1868); in 1868 became one of the editors of the Cincinnati *Gazette*; at the invitation of Horace Greeley joined the editorial staff of *The New York Tribune* in 1868, and in 1869 became managing editor. Upon the nomination of Greeley for the presidency in 1872 Mr. Reid became editor-in-chief, and when the former died in the fall of that year he became chief proprietor as well as editor of the *Tribune*. In 1878 President Hayes offered him the U. S. mission to Berlin, which he declined. The offer was renewed under the administration of President Garfield, and again declined. In 1878 he was elected by the New York Legislature regent of the State University, to succeed Gov. Dix. In Mar., 1889, Mr. Reid accepted from President Harrison the appointment of minister to France, and resigned the editorship of the *Tribune*. After securing the repeal of the French decree

prohibiting the importation of U. S. meats, and negotiating extradition and reciprocity treaties, he resigned office and returned to the U. S. in Apr., 1892. In June, 1892, he was nominated for the vice-presidency of the U. S. by the Republican national convention, but failed of election. His time since then has been divided between foreign travel and the direction of the *Tribune*. Among his occasional addresses, afterward published in book form, are *Schools of Journalism* (New York, 1871); *The Scholar in Politics* (1873); *Some Newspaper Tendencies* (1879); *Town-hall Suggestions* (1881). Revised by W. F. JOHNSON.

**Reid, WILLIAM, D. D.**: minister and editor; b. in the parish of Kildrummy, Aberdeenshire, Scotland, Dec. 10, 1816; was educated at the University of Aberdeen; went to Canada as missionary of the Established Church of Scotland; was pastor at Graton and Colborne, Upper Canada, 1840-48; was one of the founders of the Presbyterian Church of Canada 1843; was pastor at Pictou 1849-53; editor of *The Ecclesiastical and Missionary Record* 1853-75; since 1853 has been clerk of synod and treasurer of the schemes of the Church. Dr. Reid was moderator of the Synod in 1850 and 1873, and of the General Assembly in 1879.

C. K. HOYT.

**Reid, WILLIAM JAMES, D. D.**: clergyman; b. at South Argyle, N. Y., Aug. 17, 1834; was educated at Union College and Allegheny Seminary; corresponding secretary of the United Presbyterian board of home missions 1868-72; principal clerk of the United Presbyterian General Assembly since 1875; and since 1889 pastor of the First United Presbyterian church, Pittsburg, Pa., and editor of *The United Presbyterian*. Dr. Reid has published numerous sermons and pamphlets: *Lectures on the Revelation* (Pittsburg, 1878); and *United Presbyterianism* (1881; 2d ed. 1883).

C. K. HOYT.

**Reidsville**: town (founded in 1865); Rockingham co., N. C.; on the Southern Railway; 24 miles N. of Greensboro, and 24 miles S. W. of Danville, Va. (for location, see map of North Carolina, ref. 2-F). It is in the heart of the "bright" tobacco belt, and is a large leaf-tobacco market, selling about 8,000,000 lb. per year. There are 4 large warehouses for the sale of the leaf, tobacco, cigar, and cotton factories, flour and lumber mills, 8 churches, high school for boys, graded public schools, a female seminary, a State bank with capital of \$50,000, an incorporated bank with capital of \$50,000, and 3 weekly newspapers. Pop. (1880) 1,316; (1890) 2,969; (1894) estimated, 3,500.

EDITOR OF "REVIEW."

**Reigate**: town; in the county of Surrey, England; 21 miles S. of London (see map of England, ref. 13-J). The parish church of St. Mary (mixed Transition Norman and Perpendicular) dates from the reign of Henry VII. It contains a library with MSS. and rare books. Reigate carries on a considerable trade in fuller's earth and sand used in the manufacture of glass. Pop. (1891) 22,646.

**Reign of Terror**: the name given to that period of the French Revolution which lasted from Jan. 21, 1793, the day of the execution of Louis XVI., till July 27 (9 Thermidor), 1794, when Robespierre was guillotined and the committee of safety broken up. See **FRANCE, HISTORY OF**.

**Reims**: a city of France. See **RHEIMS**.

**Rein, rin, JOHANNES JUSTUS**: scholar and compiler; b. at Rauenheim, Hesse-Darmstadt, 1835; studied at the University of Giessen, and taught for several years. In 1873 he undertook a mission to Japan on behalf of the Prussian Government for the purpose of studying Japanese industries and commerce, and spent two years in that country. On his return he was appointed Professor of Geography at Marburg, and in 1883 was transferred to a similar post at Bonn, where he succeeded Baron von Richthofen. In 1893 Dr. Rein served as a judge of art industry at the Columbian Exposition in Chicago. The results of his Japanese researches were embodied in his valuable *Japan nach Reisen und Studien dargestellt* (2 vols., Leipzig, 1881, 1886), of which an English translation has appeared under the titles *Japan, Travels and Researches* (London, 1884) and *The Industries of Japan* (London, 1889). A later work treats of Columbus and Spanish subjects—*Geographische und naturwissenschaftliche Abhandlungen* (Leipzig, 1892). J. M. DIXON.

**Rein, WILHELM, Ph. D.**: professor of pedagogy; b. at Eisenach, Germany, Aug. 10, 1847; studied at Gymnasium, Eisenach, 1857-66, Jena University 1866-68, Heidelberg 1868-69, Leipzig 1870-71; teacher in Realschule, Barmen,

highly gifted of the pupils of Gottfried Hermann, and an inspiring teacher of great learning and critical talent. He died, after occupying the chair of Classical Languages at Halle for a few years, at Venice, Jan. 17, 1829. His principal works, which have not yet lost their value, are *Vorlesungen über Lateinische Sprachwissenschaft* (3d revised and enlarged ed. in 3 vols., 1888); *Coniectanea in Aristophanem*; critical and exegetical edition of Sophocles's *Edipus Coloneus* (2 vols., 1823). Cf. Fr. Ritschl, *Opusc.* (v., pp. 95 ff.); O. Ribbeck, *F. W. Ritschl* (i., pp. 34 ff.).

ALFRED GUDEMAN.

**Reiske, ris'ke, JOHANN JACOB:** Greek scholar; b. in Zörbig, Saxony, Dec. 25, 1716; matriculated in 1733 at the University of Leipzig, where he devoted himself especially to the study of Arabic. In 1738 he went to Leyden to study the Arabic MSS. in the university library, and eked out a spare living by correcting proof-sheets and by giving private lessons. Amid such hardships he still found time for the study of medicine, graduating in 1746. Soon afterward he returned to Leipzig, and here also he lived in abject poverty for twelve years, when he secured the rectorate of the famous Nicolai Gymnasium. This position he retained till his death Aug. 14, 1774. Reiske is one of the greatest Greek scholars that Germany has produced, and his genius, though depreciated in his lifetime, is now becoming ever more generally recognized. His productivity is astounding; his most celebrated works are editions, commentaries, and translations of Plutarch (12 vols., 1782); Dionysius of Halicarnassus (6 vols., 1777); *Oratores Graeci* (12 vols., 1770-75); Dion Chrysostomos (2 vols.); Libanius (4 vols.); Theocritus (2 vols.); Maximus Tyrius (2 vols.); and many other minor editions. To these must be added a collection of *Animadversiones in Græcos auctores* (5 vols., 1757-66). Many of his works were published posthumously by his wife, ERNESTINE CHRISTINE (1735-98; married 1764). See his *Autobiography*, pp. 818 (1783); M. Haupt, *Opuscula* (iii., pp. 137 ff.); Bursian, *Gesch. der classischen Philologie in Deutschland* (pp. 407-416). ALFRED GUDEMAN.

**Reisner-work:** See BUHL-WORK.

**Reiss, WILHELM:** traveler, ethnologist, and naturalist; b. at Mannheim, Germany, in 1838. He graduated at Heidelberg 1864; visited Greece 1866; and from 1868 to 1876 traveled in South America, generally in company with A. Stübel. Their most extended explorations were in Colombia, Ecuador, and Peru, where they ascended and measured many peaks of the Andes, and made valuable archaeological and geological studies. Their most important joint publication was *Das Totenfeld von Ancon in Peru* (3 vols. folio, 1880-87), a magnificently illustrated work on the Indian burial-grounds of Ancon, near Lima. They also published, jointly or separately, many papers in Spanish at Quito; and Reiss is the author of several works in German on South American geology and topography. H. H. SMITH.

**Relapsing Fever, also known as Famine Fever, and, technically, as Febris Recurrens** [*relapsing* is from Lat. *relabi*, *relapsus*, fall back, relapse; *re-*, back, again + *la-bi*, slide, fall]; a specific infectious and contagious disease due to the action of a micro-organism, the *Spirochæta obermeieri*, which flourishes in the blood. It occurs only at intervals of some years, and generally during seasons of privation and insalubrity, attacking chiefly the lower classes, ill fed and housed. The idea was formerly held that relapsing fever is a dietetic disease pure and simple. This is not the case, though famine makes large masses of people susceptible to the specific germ. Its formative or incubating stage is from four to ten days. Its onset is sudden; the patient, having been perfectly well at the time, is able to fix the exact time of the attack. It begins with an abrupt and severe rigor, or chill with nervous tremor, and immediate sense of extreme weakness. There is sharp frontal headache, pain in the back and limbs; then follow flushed face, thirst, dry tongue, high pulse, and a steady ascent of body heat. The facial expression and temperature are characteristic. The mind is unaffected, and the face, with the sunken but clear and full eyes, wears a pitiable, helpless, appealing look. The complexion has a bronzed hue, and may be slightly jaundiced. The temperature rapidly ascends and during four or five days remains 105°, 106°, 107°, 108° F.—an unusual fever heat unaccompanied by brain symptoms or danger of death. Physical examination may detect enlargement of the liver and spleen; the urine may contain not only albumin and urea in excess, but blood and casts indicative of acute congestion of the kidneys. The fever

and extreme depression last from five to seven days, when, with some critical evacuation, as profuse perspiration, diarrhoea, or urination, a sudden abatement and rapid convalescence set in. Appetite and strength are slowly returning, and the invalid is about, when, on the fourteenth day from the first attack, he is seized by a second or relapse resembling the first. Very rarely, a third, fourth, and even a fifth relapse, occurs. The mortality is not as high as in typhus fever, nor as great as the severe symptoms would indicate. The treatment during the active period is essentially antiphlogistic and expectant—cooling drinks, gentle salin-laxatives, sponging, light diet; during convalescence, free use of concentrated liquid diet, tonics, especially liberal use of quinine and brandy. Revised by W. PEPPER.

**Relativity:** the principle in psychology according to which all mental states are influenced by preceding and accompanying conditions of consciousness. The principle was formerly a theoretical doctrine of philosophy, and was discussed in all early English philosophy under the phrase "relativity of knowledge." According to this theory, no knowledge was of an object as it really existed outside of the mind, but was only of an "idea" of this object in consciousness, subject to all the modifying influences, both of the nervous system and of the come and go of other impressions and ideas. The historical development of the doctrine is due mainly to Stuart Mill and Sir William Hamilton. The Kantian theory of knowledge, which made the mind's object a construction in certain forms native to the mind, was a further and important development of the doctrine of relativity toward subjective idealism. In current thought the law of relativity has become an established psychological doctrine. It gets its first application in the theory of SENSATION (q. v.). It is found that none of the attributes of sensation is constant, but that they all vary with the condition in which consciousness already is when the sensation comes to it. Particular applications are found in the theory of "color-contrast," in the modifying influence of attention on all sensations, in the working of Weber's law (see PSYCHO-PHYSICS) upon the intensities of sensation-states, and in the influence of muscular states and strains at the time that the sensation in question makes its advent in the mind. See the *Psychologies* of James, Höffding, Baldwin, under the heading *Relativity*; Hamilton, *Lectures on Metaphysics*; Mill, *Examination of the Philosophy of Hamilton*; and Lotze, *Metaphysic*.

J. MARK BALDWIN.

**Release:** in law, the extinguishment of a pre-existing right. It may consist in an agreement upon a legal consideration, or in a sealed contract, or it may result from the acts of the parties or from the operation of law. While there is much authority for the statement that an obligation under seal can be released only by a contract under seal, the better modern view is that a release upon a legal consideration is equally effective in extinguishing an obligation with the common-law release under seal. The voluntary destruction of an obligation, or its surrender by the obligee to the obligor, with the intention of discharging the latter, will operate as a release. The law often works the discharge of an obligor in cases where the parties intended no such result. A contract for personal services is terminated by the death of either party. At common law the death of a joint contractor extinguished the obligation so far as he or his estate was concerned. Likewise the release of one joint obligor worked the legal release of his co-obligors, and the release by one joint obligee was binding on his co-obligees. The language of a release is to be dealt with according to the general rules of INTERPRETATION (q. v.).

The right which is extinguished by a release may be a title to real property; hence a release may be a form of conveyance. Here it is classed as secondary or derivative because it presupposes a preceding conveyance. It passes the releaser's right in land to one who has a former estate in possession therein. It is said to inure by way of enlarging an estate, or by way of passing an estate, or by way of passing a right, or by way of extinguishment, or by way of entry and coemption. (2 Blackstone's *Commentaries*, 324-325; *Miller vs. Emans*, 19 N. Y. 384.) See BARGAIN AND SALE, DOWER, JOINT OWNERSHIP, JOINTURE, and LANDLORD AND TENANT. For Roman law rules, see OBLIGATION.

FRANCIS M. BURDICK.

**Relief:** in sculpture and some decorative arts, the projection of figures from a background; also a work of sculpture in which the figures stand out from a background, instead of

shall now endeavor to classify the religions of the world first after the line or tendency, then after the degree of their development. To determine the line or tendency of development which a family of religions has followed in the course of history, the principal characteristics of such a family must be found out. That which really characterizes a religion or a group of religions is the notion they have formed of the relation between God and the world, God and man, and of the manner in which the Deity chooses to be worshiped. By applying this method to the religions with which we are best acquainted, some distinct families can be marked out with certainty even now, and by applying it to those which are not so well known, the documents and information from which they must be studied being less abundant, less clear, or less accessible, some probable hypotheses about their mutual relationship may be drawn.

Just as there are an Aryan and a Semitic family of speech, there are two corresponding great families of religions, which provisionally and only for convenience' sake may be called the Aryan and the Semitic religions. Studying these two groups we find that each of them develops, with marked and growing oneness, one of the fundamental ideas of religion without totally denying the other—viz., the Aryans the kinship between God and man, the Semites the eminence of God above man; the former regarding the Deity as the father of gods and men, the divine protector of the human race and of the same nature with it, though higher and mightier; the latter venerating their gods as lords, masters, and kings, whose obedient servants, nay, whose slaves, they are; the former laying the greatest stress on that which is dogmatically called the immanence, the latter on that which is dogmatically called the transcendency of the Godhead. The former or Aryan religions may be called theanthropic; the latter or Semitic may be called theocratic.

*Theanthropic Religions.*—The principal theanthropic religions are—(1) the Vaidic religion in India and its offshoots; (2) the religion of the ancient Iranians, Medes, Persians, and Bactrians, of which the Zarathustrian Mazdeism was a reform, protected by the Achaemenids and re-established under the latter Arsacids and the Sassanids, though perhaps partly altered under foreign influences. These two are branches of the same stem, as is proved by the many divinities, religious ideas and rites, especially the Soma-Haoma worship, which they have in common, but they have developed quite independently, and have really evolved into decided antagonists, the one led by uncontrolled theosophic speculation to the utmost limits of monistic pantheism, and even atheism, the other founding on a rather superficial dualism a practical system of religious observances and sober morality. Originally not less closely related are the religions of (3) the ancient Greeks and of (4) the Romans; but the Greek or Hellenic religion, under the high pressure of various Eastern creeds and cults, grew into that most attractive, but from a moral standpoint dangerous, humane polytheism, the worship of beauty and genius, while the Roman religion was organized to a cold and formalistic ritualism, till it was totally reformed by a gradual infiltration of Hellenic gods, ideas, and rites. Next come (5) the nearly allied Germanic religions, including the Scandinavian and the Teutonic, which, if the moral dualism of the *Edda* can be considered as old and original, show a great resemblance to the Iranian religious system; (6) the rather primitive but vaguely poetical Windic or Slavonic, and (7) the Celtic religions, which are still imperfectly known, but as far as they are known seem to represent the most ancient form of theanthropic religion, dissimulating its barbarous myths and bloody rites under a veil of magical mysticism.

*Theocratic Religions.*—The theocratic religions of Western Asia are much more closely related than are the theanthropic religions, the former covering a limited area, while the latter are spread from the Ganges to Iceland. The more primitive forms of worship belonging to this family must be sought among the Arabians and among other nomadic tribes of the desert. A marked theocratic character is shown by the Babylonian religious system, of which the Assyrian is an offshoot, only slightly differing from it in detail, though grafted on the really heterogeneous religion of the older inhabitants of the country, the so-called Sumerians (Accadians), and having borrowed from it not a few gods and rites. The same may be said of the religions of the Arameans, the Canaanites and Phœnicians, and the Hebrews. In the religion of Israel the same fundamental idea, combined with the conception of God's holiness—by which

originally is meant that the heavenly Sovereign is inaccessible—has been developed by the Mosaic reform and the preaching of the prophets into that ethical monotheism which stands unequalled among the religions of antiquity. Even Islām, the religion founded by Mohammed under the influence of imperfectly understood Judaism and Christianity, though semi-universalistic, must be regarded not only as a theocratic religion but as the one in which the conception of the Deity as an absolute sovereign has been worked out to its utmost consequences. In Christianity, on the contrary, the two currents meet; it is constantly struggling to maintain a kind of balance between the two principles, or even to combine them in a higher unity. It is only fair to say that the younger Judaism, which preceded it, had already prepared the way, as it had weakened the old, one-sided theocratic doctrine by its moral dualism and its belief in personal immortality.

*The Egyptian Religion.*—It might be expected, as the Egyptian language contains so many Semitic elements, that the religion would likewise be theocratic; but, though decidedly theocratic, it is theanthropic as well, and so represents a stage of development at which the two principles were still equally acknowledged. Perhaps the pre-Babylonian religions of Western Asia were more or less closely related to the Egyptian religion; certain it is that some of the oldest Egyptian gods and myths show a great resemblance to gods and myths probably borrowed by the Babylonians and other Western Asia nations from their predecessors. All this, however, is hypothetical.

*Some other Families of Religions.*—It would be impossible to give a complete classification of all religions with the present data. However, mention may be made of the *patriarchal* religions, in which the divine beings, worshipped as "elders, old ones, grandparents," are mutually related in the same way as the heads of different tribes or families, of whom one is superior to the other inasmuch as he is mightier, but each of whom exercises authority independently and in his own sphere. To these belong the religions of the Ural-Altaic peoples (Finns, Lapps, Estonians, and their relatives, though the first named have borrowed much from the Germans), and perhaps also some religions of North American nations. The Chinese religions that are known are of another kind. They might be called *anthropocentric*, as the human spirits (*shin*) constitute the middle class between the two other classes, viz., the heavenly and the earthly, strictly distinguished from both of them, but just as well venerated by the living. Probably also these have formed a group or family with the religions of some kindred peoples, but of the latter little is known.

As to the remaining religions only the classification which corresponds to the ethnological and the glottological one can be given.

*Classification after the Degree of Development.*—To classify the religions according to the degree of their development, which is usually, but not quite correctly, called the morphological classification, one must observe them at the highest standpoint they have reached—not in their growth nor in their decline. It is true that of some religions we must assume that, having had their development checked by adverse causes, they have remained stationary on a lower level than was possible for them to attain, and that of other religions we may suppose that they have fallen into decay through isolation, oppression, general degeneration of a people; but as it is no longer possible to gather information concerning their better state otherwise than by guessing from some vague traces, we are compelled to classify them only by what we know of them with certainty. According to this standard of comparison religions are divided into the two great categories of nature-religions and ethical religions.

*Nature-religions.*—By nature-religions we mean those whose highest divinities, be they spirits, fetishes, or man-like beings, are mighty powers of nature, connected in some way with a definite natural object or phenomenon. From these religions the ethical element is by no means excluded. On the contrary, from the remotest times moral qualities have been attributed to the gods or have been deified themselves, and this has been done more and more according as the deities have become more anthropomorphized. The ethical element, however, remains subjected to the nature-gods, and the latter are by no means bound by it.

*Different Degrees of Nature-worship.*—Among the nature-religions there is a great difference as to development, though all of them, even the highest, are still dominated by the same principle. On the lowest plane stands what has

*ligions of India* (F. Max Müller, 1878); *The Religion of Ancient Egypt* (Renouf, 1879); *Indian Buddhism* (Rhys Davids, 1881); *The Native Religions of Mexico and Peru* (Reville, 1884); *Celtic Heathendom* (J. Rhys, 1886); *The Religion of Ancient Assyria and Babylonia* (Sayce, 1887); *The Religion of the Persia* (Darmesteter, 1890); *The Religion of the Ancient Hebrews* (1892). General works in this department are: C. Hardwick, *Christ and other Masters* (3d ed., London, 1874); A. Kuenen, *National Religions and Universal Religions* (London, 1882); Tiele, *Outlines of the History of Religion* (London, 1884; 2d ed. 1888); A. Reville, *Prolegomena to the History of Religion* (Eng. trans., London, 1885); Chantepie de la Saussaye, *Lehrbuch der Religionsgeschichte* (Freiburg im Breisgau, 2 vols., 1887-89, trans. of vol. i. *Manual of the Science of Religion*, London, 1891). Readable are J. F. Clarke, *The Ten Great Religions* (2 vols., Boston, 1870-83; n. e. 1886); G. T. Bettany, *The World's Religions* (London, 1890); F. F. Ellinwood, *Oriental Religions and Christianity* (New York, 1892); *Religious Systems of the World*, by various authors (London, 1889; 3d ed. 1893).

**Remainder** [from O. Fr. *remaindre*, deriv. of *remanere*, remain < Lat. *remanere*; *re*, back + *manere*, stay, remain]: in law, a future estate in land to take effect immediately upon the termination of a prior, limited estate upon which it depends, and with which it was created. As is explained in the articles ESTATE and PROPERTY, the estate in fee simple is conceived of at common law as being susceptible of infinite subdivision. When a tenant in fee simple grants a present, limited estate, as an estate for years, for life, or in tail, the residual interest not thus disposed of is itself an estate capable of being separately dealt with. If by the same conveyance the grantor parts with this residual estate or any part of it to a third person, it is called a *remainder*; if he does not part with it, it "reverts" to him, and is known as a *reversion*. (See LANDLORD AND TENANT.) The present or "particular" estate, as it is called, may be followed by any number of future estates in remainder until the whole fee simple has been taken up. Thus if a tenant in fee simple gives lands, by deed or will, to A for ten years or for life, then to B for life, then to C in fee tail, then to D and his heirs, A is the particular tenant, and B, C, and D are remaindermen. If the last limitation (to D and his heirs) had been omitted the remaining estate in fee simple would have, after the termination of the last remainder (to C), reverted to the grantor and his heirs.

It was a peculiarity of the remainder at common law, which was inflexibly maintained by the courts, that it could be created only as a true remnant of a fee simple to follow a prior estate which was less than the whole estate of the grantor. In other words, a remainder could not take effect in derogation of or in substitution for a preceding estate. Thus if a tenant in fee simple should make a conveyance of his land to A in fee, but with the proviso that if A should die without surviving issue then the estate should go to B in fee, the limitation to B would be void and the estate belong absolutely to A. The whole estate of the grantor had become vested in A, and it could not be divested and transferred to any one else by the creation of a remainder. The result aimed at could, it is true, be secured by the creation of a shifting use (see USES), or by executory devise (see WILL), but it could not be accomplished by any form of limitation known to the common law. By legislation in many of the U. S. remainders have lost this artificial character. In the State of New York, for example, it is expressly provided by statute that any future estate which is dependent on a precedent estate may be called a remainder, and that a remainder may be limited upon a contingency which will operate to abridge or determine the precedent estate. 1 R. S. 723 (sec. 11), 725 (27).

In the remainder proper, as above described, the interest of the remainderman was said to be "vested"—that is, the remainder, although its enjoyment was postponed to a future time, and although it was described as a future estate, was really regarded as a present interest in the lands affected by it, and was accordingly real property, capable of alienation, or, if a remainder in fee, of transmission by will or descent. Like reversions, remainders were regarded as incorporeal interests, and were, like easements and other "incorporeal" rights in land, alienable only by grant. See HEREDITAMENTS (*Incorporeal*).

Originally this "vested" remainder was the only form of future or "expectant" estate which could be created at common law, but in the course of time a gift to take effect in the future in favor of a person not now existing, or not yet ascertained, or upon an event which might or might not happen, acquired recognition under the description of a "contingent" remainder. Such a remainder was not, properly speaking, an estate, inasmuch as it could not be alienated or devised, and would not descend to the heir of the contingent remainderman. It was, moreover, an interest of a most precarious character, as it was liable to destruction by any one of a variety of accidental or intentional circumstances. If the event upon which the contingent estate was limited to depend had not happened at the time when the preceding estate came to an end, the contingent remainder was destroyed. So also a release of the reversion to the particular tenant or the surrender of the estate of the latter to the reversioner, whereby the reversion and the particular estate were merged (see LANDLORD AND TENANT), had the effect of destroying the intervening contingent remainder. This process may be illustrated by supposing A to have a life-estate, with remainder to the (unborn) son of B for his life, with remainder to C in fee. If B's son has not come into being when A's life-estate comes to an end, the contingent remainder of the former is destroyed forever, and the estate vests at once in C. So if, before the birth of B's son, A should convey his life-estate to C, or C his vested remainder to A, the estate would be lost to the contingent remainderman forever. If, however, B's son should be born before any of the events above suggested have happened, his interest would at once become vested, and would from that time on be wholly unaffected by such contingencies. By legislation, whereby contingent remainders are preserved from destruction by the events above enumerated, and whereby they may be alienated or may descend to the heir of the contingent remainderman, these interests have been very generally assimilated to vested remainders both in England and in the U. S., and have thus in a greater or less degree acquired the character of true estates.

**Rembang:** a Dutch residency of Java, East Indies, comprising 2,600 sq. miles, with (1888) 1,241,093 inhabitants, of whom about 18,000 are Chinese and 700 Europeans. The capital, Rembang, on the flat, hot, northern shore of Java (see map of East Indies, ref. 8-E), has 25,000 inhabitants and some ship-building.

Revised by C. C. ADAMS.

**Rembrandt** (full name, *Rembrandt Harmenszoon Van Rijn*): painter and engraver; b. at Leyden, Holland, July 15, 1606. He first studied painting with Jacob von Swanenburgh, and then under Peter Lastman, at Amsterdam. He returned to Leyden in 1623 and gave himself up to studying from nature and painting portraits. About 1629 he settled in Amsterdam, where he remained till his death. His fame was great, his studio crowded with scholars, and his works in great demand, yet in 1656 he became insolvent. It is supposed this may have been owing to the impoverished state of the republic, and to his reckless extravagance in collecting works of art. Sufficient data exist contradicting the oft-repeated tales of his miserly habits. Rembrandt was the greatest genius among Dutch painters, and his influence in the art of his country is paramount. He was married twice, and had in all four children. His son Titus by his first wife became a painter, but did not distinguish himself, and died in his father's lifetime. Among Rembrandt's best-known works are *The Presentation in the Temple*, at The Hague; a portrait of a young man in the royal collection at Windsor; the portrait of Coppenol at St. Petersburg; *The Anatomical Lecture* painted in 1632, at The Hague; *The Night Watch*, at Amsterdam, a prominent example of his maturer work, dated 1642; the portraits of the Syndics, also at Amsterdam, dated 1661, which shows his later manner. He is supposed to have been painting on *The Betrothed Jewess*, now in the Rijks Museum, Amsterdam, the year of his death, 1669. He was buried in the Wester Kirk, Oct. 8 of that year. Of his engravings the most famous are *Jesus Christ Healing the Sick*, six portraits of himself done between 1630 and 1654, *Burgomast-Six*, *Adam and Eve in the Garden of Eden*, *The Flight*

sculptor. In the same year Giotto was thirty-four years old, and had painted the Arena chapel at Padua and the chapel of the Florence Bargello, in which works are still to be seen the plain evidences of a combined realism and skill—a desire to think for himself, and a power to express thoughts in painting—which are at the bottom of later progress in painting. These early dates show that the Renaissance in fine art was well under way before any influence from the humanists or the restorers of classical learning had reached the painters and the sculptors. Those artists were thinking out for themselves the great question why the antique sarcophagi and the Græco-Roman engraved gems showed an art so much more learned and complete than theirs. Before Petrarch died, leaving the literary and philosophic Renaissance alive and in progress, if not yet assured, Andrea Pisano had completed the present south doors of the baptistery at Florence, Balduccio had put up his three or four important tombs at Milan, and Orcagna had adorned the Or San Michele at Florence with his marvelous work, ahead of its time and reaching on toward another century, the shrine of the Madonna. Then indeed there seemed to come a pause, and it is hard to understand why so little important art was produced between 1360 and the year 1420 or thereabouts, when Giacomo della Quercia and Lorenzo Ghiberti had come to the front, and Donatello was a promising young sculptor—when, in painting, Fra Angelico and Gentile da Fabriano were gradually leaving missal books and bridal chests for wall-pictures, and the great innovator Masaccio was fairly at work. The year 1425 may be taken as a good date for the triumphant establishment of the new wisdom and power in fine art. Then Masaccio's frescoes in the Brancacci chapel at Florence were well advanced. Then Giacomo della Quercia, who had completed the lovely recumbent figure of Ilaria del Carretto a year or two before, began his sculptured work at San Petronio at Bologna—sculptures associated with a mediæval-seeming doorway, but as far as need be from mediæval in character: indeed modern in conception and in modeling. Then, too, Lorenzo Ghiberti, who had just completed the present north doors of the Florence baptistery, had begun the more elaborate east doors—not necessarily superior to the earlier ones in real merit, but immensely in advance of them and of other previous sculpture in power over material, and in boldness and grasp of subject. And at that time Donatello, whose work is often less easy to date, had certainly completed the noble statues of the exterior of Or San Michele at Florence, the St. Peter and St. Mark, and the admirable St. George. Little had the Renaissance artists learned from the classical scholars up to this time, and yet modern sculpture and modern painting were begun, their possibilities shown, and their future course well indicated.

*The Fully developed Renaissance.*—The year 1475 is the central point in the century of greatest artistic achievement of the Italian Renaissance, excluding the Venetian painters. The one noticeable effect of the revival of letters upon fine art, the suggestion of subjects from classical antiquity, was then as noticeable as it was to become. This is not of great importance, for the great artists of that time, as of all times, cared little what stories their work was to tell to non-artistic beholders, and painted an allegory of the *Garden of Cupid* as cheerfully as a martyrdom. The important thing is the extraordinary variety of artistic power possessed by the men who were then at the head of the fine-art movement. In Florence Fra Filippo Lippi had been dead seven years, leaving behind him a large number of somewhat prosaic but vigorous and animated pictures. Berozzo Gozzoli was about fifty years old, and had painted his remarkable frescoes in the Pisan Campo Santo. Sandro Botticelli was twenty-eight years old; he had painted those wonderful round Madonna pictures which are now seen in the Louvre and the Uffizi; and either had painted or was on the point of undertaking that *Triumph of Spring* or *Flora*, the famous allegorical picture of the Florence Academy of Arts. The great Ghirlandajo was of about the same age, and had not quite reached his mature power. The two brothers Pollajuolo were at the height of their joint career. Luca della Robbia had done all his best work, both in marble and in glazed terra-cotta, and was an old man. Mino da Fiesole had finished the tomb and the altar of Fiesole cathedral and the noble compositions of the Florence Badia. Verocchio, painter and sculptor, forty years old, was at work upon the *David* of the Florence National Museum. His great pupil, Leonardo da Vinci, was twenty-three years old and at work, but destined to so long a career that he belongs

rather to a later epoch than this. In the north, where Leonardo was to labor the most, Mantegna was forty-five years old, and had finished his work at the Eremitani at Padua and the castle at Mantua, besides a host of separate pictures and his principal engravings. Of the Venetian painters, even, later to reach greatness and destined to hold it longer, the founder of the school, Giovanni Bellini, was thirty years old. He had painted the splendid altarpiece of the Church of SS. Giovanni e Paolo, Venice, which was burned in 1867, and the gigantic altarpiece at Pesaro, which still remains, and had perhaps reached his greatest strength though he was to retain it long. These pictures are worth to rank with those of Central Italy; it is not because of unmatched achievements of the later Venetians surpassing them that they should be depreciated. The Renaissance of fine art in its purest and loveliest form is in the best pictures of Giovanni Bellini. Still more powerful work was done than any of these mid-Renaissance paintings and sculptures could offer—more powerful, but with not a great charm.

*The Late Renaissance.*—Italian writers are extremely careful to mark the close as well as the beginning of the *Rinascimento* or *Risorgimento*. Most of them end the epoch with the early years of the sixteenth century, the *Cinque Cento*, and call the art of that century the *Classicismo*, because it is all, but especially architecture, strongly influenced by the study of ancient Roman remains, or the art of the *Decadenza*, as having lost the charm of spontaneity and unaffected grace, or simply the art of the *Ungarino Cento*. The pre-Raphaelites had somewhat the same feeling when they took Raphael's work in Rome (1508 and following years) as the turning-point, with growth before, and decay after. Michelangelo's long career begins with our century year 1475, lasts through the splendid years of highest and purest achievement in Central Italy, and outlasts everything that was precious and hopeful in Italian art anywhere in the world.

By 1525 the artists who were great in 1475 were all dead, but this half century was filled with the labors and with the fame of most of the men named under the earlier date, and besides them, of the following: Filippino Lippi, who died in 1505, Fra Bartolomeo, who died in 1517, and Lorenzo di Credi—all three men of the Florentine Renaissance proper. Andrea del Sarto, modestly keeping up the older tradition except when the overwhelming force of some one of his contemporaries swayed him, capable of anything, but original only in that he gave to his canvases an unwonted glow of color. Among the Umbrians and so-called Roman school, there was Perugino, who had died in 1524, and Francia (Raiaboldi), who had died in 1517—great workmen, whose art is somewhat lost in the splendor of Raphael's glory; Raphael, who had died in 1520, having made the deepest mark upon the artistic thought of his time, and gained a celebrity and recognition far beyond what other artists had reached; and Luca Signorelli, of Venice and Central Italy, most powerful and accomplished of all the men who missed supreme greatness; finally (still excepting the great Venetians), Michelangelo in 1525 had painted the Sistine vault and had sculptured the *Moses*, the *Florence Pietà*, the bronze *Pope Julius*, and the *Christ of Sta. Maria sopra Minerva*.

After 1525 decay was rapid. Pontormo and Ridolfo Ghirlandajo, with such mechanicians as Vasari and Verrocchio were in the field, and in the north Bernardo Luini was still alive and painting. Andrea Sansovino, best known by the splendid tombs in Sta. Maria del Popolo at Rome, was still alive in 1525, but near his end. Jacopo Sansovino, rather architect than sculptor, had still the divine gift of form in sculpture. Michelangelo was still to complete the Medici tombs at San Lorenzo. Benedetto da Rovazzano had taken his splendid talent to England; and both there and in Florence has left beautiful work behind him.

*The Venetian Painters.*—In 1525 Giorgione was dead. Titian was nearly fifty years old and in the fullness of his strength. Of the other giants Tintoretto was a boy, and Paolo Veronese unborn; but in Venice the conditions which obtained elsewhere were of no force. Venice was hardly an Italian city, but a little world by itself, poised between the East and the West. Decay did not set in there till much later than in the center. See the notices of the painters named above; also BELLINI and TIEPOLO.

*In other Countries.*—The descriptive term Renaissance hardly applies to the work of the painters and sculptors elsewhere than in Italy. The art work in France, Spain, Belgium, Germany, Holland, and England is rather a

Italy, partly because of war and political decline, but partly also because of the substitution of a style of architecture made up of rules and fixed measurements for the fresh inspiration of the earlier time. Thus in the year 1535 the full classical style is embodied in perhaps its loveliest creation, the Library of St. Mark in Venice, and the Renaissance makes its farewell in the front of the Scuola di San Rocco. In that same year Francis I. was surrounded by his Italian and French artists and artisans, and they were still feeling their way with hesitating steps. The Château of Chambord was well advanced but far from completion, and so with Francis's own wing of the Château of Blois, but the new Louvre had not been begun. In Germany and in England the introduction of classical details had hardly begun, and not the least impression had been made upon the general character of the over-picturesque, gabled, and turreted character of the continental art, or of the prosaic Tudor style of England.

The full charm of the Renaissance continued in France through the reigns of Francis I. and Henry II., 1515-59. Then with the religious wars of succeeding reigns comparatively little was done. The style of Henry IV. succeeds, and the French writers are careful not to include that epoch in the Renaissance. If, however, we take the years 1600-10 as the reign, which it is, for our purpose, we find still the most marked difference in the character of the buildings in Italy and in the north. The very "orders," as understood by Henry's architects in Paris, are plastic, modified almost at will; and in Germany, where Ionic or Corinthian columns are seen at all, they are generally small colonnettes, decorating the bold bay windows and stepped gables of a style as picturesque and diversified as that of the Middle Ages. Meantime, in Italy, St. Peter's was being pushed toward completion; in fact, the great colonnade of the front was nearly complete in 1610. Palladio, chief of all classicists, had died in 1580, and all his designs which remain to us had been completed as we have them before 1600. The reign of formality was complete in Italy for nearly a century before it had much hold upon the north.

Buildings in the true classical spirit were built under Louis XIII., such as the wing of Gaston of Orleans at the Château of Blois. It was not, however, until the middle of the seventeenth century that the grandiose and formal style of Louis XIV. finally replaced the French Renaissance. The colonnade of the Louvre was begun in 1664. Before that time the country châteaux and the buildings in provincial cities kept much of the movement and variety of the sixteenth century. The colonnade of the Louvre, the Church of the Invalides, with its noble dome, and the colossal Château of Versailles, in which everything, even the chapel, was of a grandiose, pseudo-Roman type, finished the struggle. From that time the Roman style prevailed, even in Eastern Germany and in England. St. Paul's in London was begun in its present form about 1675.

The architectural style of the seventeenth century toward its close certainly sins on the side of coldness and formality. A singular result of this was the Barocco style which was so soon to follow—perhaps a natural and inevitable reaction. Germany, whose princes had tried to follow Louis XIV. and to build small imitations of Versailles, found the chilly grandeur of that style insupportable, and eagerly took up the novel variety and play of fancy, however insubordinate. The Zwinger Palace at Dresden is one of the earlier instances of this new taste; but that seems to have been thought extravagant. So fantastic a style in cut stone and out-of-doors was too much even for that period of doubtful taste. A better type, and one of the best instances of the developed Barocco style, is the Schloss of Brühl, near Bonn on the Rhine, begun about 1725. Here the exterior is stately and grave, with a "colossal order" of pilasters—that is, an order occupying the whole height of the main wall and including several stories. The smaller details indeed may be rather riotous, and the roof intemperate in curvature, but the full fancy of the designers is kept for the interior, where scroll-work and *rocaille* flourish in their fullest development. The Schloss at Bruchsal, near Heidelberg, is another such building, built about 1741, while the Brühl building was still incomplete. To find in France instances so characteristic of the Barocco style, it seems necessary to examine, for interiors, the Hôtel de Soubise (now the Archives Nationales) and the Hôtel de Toulouse (now the Bank of France). Something of the original exterior remains also in these buildings, but perhaps the great barrack called still the Military School, fronting on the Champ

de Mars, and the Château of Compiègne, N. E. of Paris, are the best exteriors of the time. These are both the work of an architect of exceptional ability and good taste, Jacques Ange Gabriel (1699-1782). It is to be noticed that in such an epoch of careful reference to authority and submission to generally admitted rules stately buildings will be erected in the spirit of a previous epoch in spite of a more corrupt taste prevailing in minor arts. Thus in England the Cambridge University senate house, built in 1730, and the Ratscliffe Library at Oxford a little later, each by James Gibbs (1674-1754), are wholly admirable as pieces of design in a style which admits of but little originality. They are worthy to be compared, as to their exterior, with the French buildings of Gabriel, above named. It is in the interior fittings that the style alternates between unrestrained license and cold monotony. In the minor buildings of the time the same bad influence is at work, the only architectural feature recognized as noble being the colonnade or the order of pilasters, with their high plain basement beneath. Buildings which could not have these costly decorations were left with flat walls and square openings evenly spaced. The often complained of monotony of Baker Street and Regent Street in London came, not from the Renaissance proper, but from its unhappy successor, the grandiose Roman revival, begun in Italy in the seventeenth century.

Some attempt at a reaction was made under Louis XVI. Jacques Germain Soufflot (1714 or 1709-80) built the Church of St. Geneviève, or Panthéon, all but the cupola. Pierre Rousseau (b. 1750) built in 1786, for a private residence, the Hôtel of the Legion of Honor on the Quai d'Orsay. In these and in other structures of the time an originality of conception is shown foreign to the previous epoch of a hundred years or more. As under Louis XVI. a new spirit of refined and delicate design is seen in furniture and ornament, so in the most important buildings of the time were the evidences of perhaps a new Renaissance, a return to reason and thought as a substitute for obedience to authority. The great French Revolution put an end to this.

*Modern Architecture.*—In all the previous sketch it has been possible to speak of the style prevalent at any given time as universally and in all cases the same. At no time does any one builder deviate from the style used by others except as he makes slight modifications, which, at once adopted by others, who in their turn add and alter a little at a time, end in the slow development of the style of the succeeding epoch. In the present era, beginning with the end of the Napoleonic wars in 1815, we face a wholly new condition of things, a condition which had never existed before in all history. From 1815 until 1894 architects have built classical buildings with huge rows of columns, as their fathers or grandfathers had done; Renaissance buildings with delicate details like those of the fifteenth or sixteenth century; Gothic buildings copied from those of the thirteenth or of the fifteenth century; Romanesque buildings studied after models of the eleventh or twelfth century; buildings supposed to be Greek, and copied from the Parthenon; and even Egyptian or Moorish attempts at novelty. It is important to understand how completely this chaos of styles, existing in the absence of any reigning style, differs from all previous experience. Probably no architectural progress can be made under these conditions. Larger and more elegant buildings may be built, and now and then a pleasing result may follow in the way of an archaeological study of some ancient structure or group of structures, but that can not be the beginning of a fine art of architecture.

*BIBLIOGRAPHY.*—There are few works on this subject in English. Fergusson's *History of Modern Architecture* is of very little value in this respect. Walter Pater's *The Renaissance* (3d ed. 1888, a series of essays) is very valuable for its truthful insight, and is a suggestive book. J. A. Symonds's *Renaissance in Italy* (vol. iii.) is devoted to the fine arts and gives much general information, but the point of view is that of a literary man having little sense of the true nature of the graphic and plastic arts. The work of Crowe and Cavalcaselle on painting in Italy (9 vols., under different titles), is wholly confined to the period of the Renaissance, although not so announced. This is true also of Charles Perkin's *Tuscan Sculptors and Italian Sculptors*, and his smaller and comprehensive work, *Historical Handbook of Italian Sculpture*; but these works do not give the results of late researches, and their statements as to minor matters of fact are not always trustworthy. The same author wrote a sketch of *Sepulchral Monuments in Italy* for a publication of the Arundel Society. Mark Pattison's *77*,

Ille-et-Vilaine, France; at the confluence of the Ille and Vilaine, 234 miles W. S. W. of Paris (see map of France, ref. 4-C). It consists of two parts—an upper or new town of an elegant and modern appearance, and a lower or old part, mostly built of wood, with narrow and winding streets; these are connected by four bridges. Among the public buildings are the cathedral (Italian), completed in 1844; Notre Dame, with a dome surmounted by an image of the Virgin; the university (1855), with a picture gallery; the hôtel de ville, with a public library; and the Palace of Justice (1618-54). It has manufactures of sailcloth, linen, lace, and embroideries, and an active trade in honey, wax, butter, and poultry. Pop. (1891) 69,232.

**Rennet:** See CHEESE (*Coagulating the Curd*).

**Rennie,** Sir JOHN, F. R. S.: engineer; b. in London, Aug. 30, 1794. His father, a distinguished civil engineer (1761-1821), early introduced him to that profession as assistant in the construction of Southwark and Waterloo bridges. In 1821 he succeeded his father as engineer to the admiralty. The new London bridge was completed by him, from designs of his father, in 1831, when he was knighted. The important works of Sheerness dockyard, Ramsgate harbor, and Plymouth breakwater, commenced by his father, were completed by him, as well as the great system of drainage and land reclamation in Lincolnshire. Of the more important works designed and executed by himself are the Whitehaven and the Cardiff docks. With his brother George (1791-1866) the machinery for the mints of Bombay, Calcutta, and Mexico was designed and erected; also the Royal Clarence victualing-yard at Plymouth. Sir John was considered the highest authority on all subjects connected with hydraulic engineering, harbors, canals, irrigation, storage of water, and the management of rivers. He was president of the Institution of Civil Engineers 1845-49; author of *The Theory, Formation, and Construction of British and Foreign Harbors*, and many valuable professional papers. D. Sept. 3, 1874.

**Reno:** city; capital of Washoe co., Nev.; on the Truckee river, and the Nev., Cal. and Or., the S. Pac., and the Virginia and Truckee railways; 11 miles E. of the base of the Sierra Nevada Mountains, and 51 miles N. W. of Virginia City (for location, see map of Nevada, ref. 5-E). It is in an agricultural and mining region, and has large trade interests. The city contains the State University of Nevada, the State prison, the Bishop Whitaker School for Girls (Protestant Episcopal, opened in 1876), a high school, 2 libraries (State University and Whitaker Hall), a national bank with capital of \$200,000, a State bank with capital of \$150,000, and 2 daily, a semi-monthly, and 2 weekly newspapers. Pop. (1880) 1,302; (1890) 3,563.

**Reno, JESSE LEE:** soldier; b. at Wheeling, West Va., June 20, 1823; graduated from the U. S. Military Academy, and entered the army as brevet second lieutenant of ordnance July, 1846; captain 1860. In the war with Mexico he was engaged in the siege of Vera Cruz and in the battles of Cerro Gordo, Contreras, Churubusco, and Chapultepec, and breveted first lieutenant and captain for gallantry; subsequently served on duty with his corps, being in command of Mt. Vernon Arsenal, Alabama, at the time of its capture Jan., 1861; appointed brigadier-general of volunteers in Nov., 1861, he accompanied Burnside's expedition to North Carolina; was promoted to be major-general of volunteers July, 1862, and in August assigned to the command of the Ninth Army-corps, which he led in the second battle of Bull Run and at Chantilly, Aug. 29-Sept. 1. At the battle of South Mountain, while at the head of his command, he was killed Sept. 14, 1862.

Revised by JAMES MERCUR.

**Renouf, re-noof', ÉMILE:** genre, marine, and landscape painter; b. in Paris, June 23, 1845; pupil of Carolus Duran, of Boulanger, and of Lefebvre; second-class medal, Salon, 1880; first-class, Paris Exposition, 1889; first-class, Munich Exhibition, 1883; Legion of Honor 1889. He spent several years in the U. S., and had a studio in New York for the greater part of the time. A large picture by him of the East river bridge, taken from the Brooklyn side at sunset, was painted in New York in 1887-88, and attracted much attention when exhibited there. His *Helping Hand*, a representative work, and one possessing many excellent qualities, is in the Corcoran Gallery, Washington. W. A. C.

**Renouf, PETER LE PAGE:** Egyptologist and Orientalist; b. in the island of Guernsey in 1824; studied at Pembroke College, Oxford; became a member of the Roman Catholic

Church in 1842, and in 1855 was appointed Professor of Ancient History and Oriental Languages in the Catholic University of Ireland at its first opening. While professor he was one of the editors of *Atlantis* and of *The Home and Foreign Review*. From 1864 till 1885 he was an inspector of schools, and from 1885 till 1892 Keeper of the Egyptian and Assyrian antiquities in the British Museum. Since 1887 he has been president of the Society of Biblical Archaeology. Besides some early works on questions concerning the Roman Church in England he wrote *The Condemnation of Pope Honorius* (1868), and *The Case of Pope Honorius Reconsidered with Reference to Recent Apologies* (1869). The former work met with strong ultramontane criticism, and was placed on the Index. His principal Egyptological works are as follows: *Notes on some Negative Particles of the Egyptian Language* (1862); *A Prayer from the Egyptian Ritual, Translated from the Hieroglyphic Text* (1862); *Sir G. C. Lewis on the Decipherment and Interpretation of Dead Languages* (1863), occasioned by an attack upon Champollion and others; *Miscellaneous Notes on Egyptian Philology* (1866); *Note on Egyptian Prepositions* (1874); *An Elementary Manual of the Egyptian Language* (1875); *Lectures on the Origin and Growth of Religion, as Illustrated by the Religion of Ancient Egypt* (Hibbert lectures, 1879); and *The Egyptian Book of the Dead: Translation and Commentary*, first printed in the *Proceedings* of the Society of Biblical Archaeology (Mar., 1892, ff.), and afterward separately (London, 1893, ff.). He edited for the trustees of the British Museum *Ancient Egyptian Texts from the Coffin of Anamun* (1886), and *Facsimile of the Papyrus of Ani*, with an introduction to the contents of the Book of the Dead (1890). He also contributed to the *Chronicle*, *The North British Review*, *The Academy*, and the *Aegyptische Zeitschrift*.

CHARLES R. GILLET.

**Reno'vo:** borough (founded in 1862, incorporated in 1866); Clinton co., Pa.; on the west branch of the Susquehanna river, and on the Phila. and Erie division of the Penn. Railroad; 28 miles N. W. of Lock Haven, the county-seat (for location, see map of Pennsylvania, ref. 3-E). It was founded by the Philadelphia and Erie Railroad Company, which established here a large foundry and extensive boiler-works and car and repair shops. It is in an oval-shaped valley with mountain-sides over 1,000 feet high, and is the center of a great tract of pine forest. The principal industries are coal-mining and lumbering. The borough contains 7 churches, 14 public and 5 parochial schools, a railway Y. M. C. A., national bank with capital of \$50,000, private bank, and a daily and 2 weekly newspapers, and is a popular summer and autumn resort for tourists and sportsmen. Pop. (1880) 3,708; (1890) 4,154. EDITOR OF "EVENING NEWS."

**Rensselaer, ren'se-ler:** town; capital of Jasper co., Ind.; on the Iroquois river, and the Louis., New Albany and Chi. Railway; 46 miles N. W. of Logansport, 72 miles S. E. of Chicago (for location, see map of Indiana, ref. 3-C). It is in an agricultural, dairying, and stock-raising region; contains a public high school, St. Joseph's Indian Normal School (Roman Catholic), a State bank with capital of \$90,000, 3 private banks, and 3 weekly newspapers, and has manufacturing of flour and cigars. Pop. (1880) 968; (1890) 1,455.

**Rent** [from O. Fr. *rente*: Ital. *rendita*: Span. *renta*: Lat. *\*rendita*, re-formed on analogy of *vendita* (*vendere*) from *red-dita* (sc. *pecunia*), money paid, perf. partic. of *red-dere*, pay back]: a payment for the use of land. In feudal times this payment was made in labor. Toward the close of the Middle Ages labor rents were generally commuted, either for a share of the produce (see *METAYER*) or for a fixed sum of money per year. For some centuries these money rents were chiefly fixed by custom; in modern times they are usually fixed by competition. Rent, as ordinarily reckoned, involves compensation for the improvements as well as for the land. If we deduct interest on these improvements, we have the amount of rent in its economic sense. Thus if a man invests \$10,000 in improving a piece of land, and then rents the property for \$1,200 a year, part of this \$1,200 is due not to the land, but to the capital invested; and we must deduct something like \$500 in order to find the economic rent. Rent is partly due to productiveness, especially in the case of mines and water-power, but chiefly to advantages of location. Improved means of transportation, by lessening the effect of differences in location, tend to reduce rent—witness the fall in agricultural rents in Great Britain, due to the fact that the lower transportation rates enable the farmers of other countries to compete on more

and their delivery into his own possession. The plaintiff when successful, if the goods have remained in the defendant's custody, recovers their possession, or in default thereof their value (assessed by the jury), together with damages for the unlawful detention or taking. If he has taken them into his own custody his title is confirmed, and he recovers the damages alone, while a judgment in such case for the defendant restores the possession, or the value, and lays the foundation for a suit for damages by him against the plaintiff. The title to the goods is not tried unless it is necessary to the decision of the question as to who has the right of possession, nor can the title to the land be directly brought into question. Sir Henry Maine, in his *Early History of Institutions*, traces the origin of this remedy to the right of a tenant to recover goods unlawfully distrained by his landlord—a right that can be traced among the Saxons prior to the Conquest, and in some of the primitive Germanic codes. See Wells's *Law of Replevin as administered in the Courts of the United States and England*, and Sedgwick on the *Measure of Damages*. F. STURGES ALLEN.

**Reports, Law:** See LAW REPORTS.

**Reposia'nus:** a Latin poet, perhaps of the early fifth century, although commonly assigned to the reign of Diocletian. (See Eskuche, *Rheinisches Museum*, 45, 256.) His hexameter poem *De concubitu Martis et Veneris* may be found in Bachrens's *Poet. Lat. Minores*, vol. iv., p. 348. M. W.

**Repossé, re-pô-sä'** [Fr., liter., thrust back, perf. partic. of *repousser*; re-, back + *pousser*, push < Lat. *pulsare*]: a French term for the art of producing reliefs, and even rounded forms, in metal by beating thin plates from behind (Germ. *das treiben*; Eng. *embossing*). The metals employed are those that by their malleability lend themselves most easily to the work—gold and silver, brass, copper, tin, and lead. This is a very ancient art; the Egyptians, Cypriotes, and Etruscans practiced it, and specimens of their skill in the art are preserved. In the Middle Ages it was widely employed both in Europe and in the East, and it has continued in use down to our own times. Some splendid pieces of reposé work were produced in Italy in the fifteenth century. These were chiefly for the decoration of altars and shrines and for use in the ceremonies of the Church. The art was in a flourishing state in Europe in the seventeenth and eighteenth centuries, but the design was artistically inferior to that of an earlier time. The art then fell into disuse for a time, but it has shared in the general revival of the arts, and is much in fashion. In Italy, France, Great Britain, and the U. S. much reposé work is now produced, and, so far as mechanical excellence is concerned, American smiths are not behind the rest of the world. The results produced by this process are superficially similar to those attained by casting, but the effects are more artistic and free, and in the best work, whether of semi-barbarous or of civilized peoples, there is more individuality expressed than any casting could give. In the old reposé work, the coarse as well as the fine, the relief is distinguished by softness of outline and the design has a look of spontaneity. The workman has used his tools as if they were the pencils of a painter or the dab-sticks of a modeler in clay. In the Castellani collection of antique jewelry exhibited at Philadelphia in 1876 were specimens of Etruscan reposé work which, though small in size and minute in execution, had all the largeness of antique sculpture. These were extraordinary pieces, but much of the Japanese, Indian, Arabic, Persian, and Moorish work of modern times has the same quality, though more rudely manifested. The reposé work of modern French, British, and American smiths is chiefly applied to gold and silver, and is distinguished by great sharpness and decision of line, so that the work is scarcely to be told from casting. See METAL-WORK.

**Representation:** in the political sense of the term, the method of transmitting the will of the people into law or action by means of a few persons chosen by the people.

In the ancient city democracies the people made their own laws. When different states took part in government, as in the Achæan League, any citizen had, as a general rule, the right to appear, and representatives in the modern sense were not chosen, though of course the persons present from any state had authority to bind their constituents.

There seem to have been, however, certain instances of real representation in ancient times, as in provincial councils summoned by Augustus and in city leagues in Asia Minor. From very early times the Church employed the principle, and probably this had influence in determining its use among

western nations. It first came into general political use among the Germanic nations, and has had its fullest development in Great Britain and the U. S. Representative democracy, the system of government that relies solely upon representation, as Bluntschli says, developed in the North American colonies and the U. S., where the causes of its development are to be found especially in the character of the people and in the extent of the territory that necessitated representation if free government were to exist. The representative system, however, is found fully developed in nearly all civilized modern states, whether republics, as France and Switzerland, or monarchies, as Germany, Austria, Italy. In the monarchies usually some check is placed upon the representative body by an hereditary or appointed upper house, as in Great Britain and Germany, and sometimes the monarch even is able to exert much power in this direction. See LEGISLATURES and LAW-MAKING, METHODS OF.

**Nature of Constituencies.**—Generally speaking, in the U. S., in France, in the German empire, and in some other countries, the constituencies are divided territorially, each representative being voted for by all classes of voters resident in his district. A system of class constituencies is in vogue, however, in some countries; for the classification of electors in Prussia, see LEGISLATURES (*Composition*). In local representative bodies in Austria members are elected by the great landed estates, by the most highly taxed industries and trades, by the towns and markets, by the rural communes, by boards of commerce, or trade-guilds. Somewhat similar constituencies are found in rural local government in Prussia. Even in England constituencies have been so divided as to separate cities from the rural districts, and economic conditions have divided constituencies in practice even more accurately than that.

**Relation of the Representative to his Constituency.**—Of grave import, both theoretically and practically, is the question whether a representative is to act merely as the mouth-piece of his constituency, blindly preferring its interest as its members see that interest, or whether he is to act with independent judgment, preferring the interests of the whole country to that of his constituency in case of conflict. Most writers adopt the latter theory as the right one from the standpoint of political science. In practice, however, representatives as a rule wish a re-election; and in consequence the expressed or understood wishes of their constituencies are likely to determine their votes. Indeed, some representatives have openly confessed that they were voting contrary to their own opinion of what was best for the country in deference to the wishes of their constituencies. This is apt to be often the case when the member represents a certain economic or social class than when his constituency includes all voters within a certain geographical district. If in general, however, the constituency determines the vote, the special advantage of the representative system—action by trained men after careful debate and consideration—would be lost, and the system might as well be abolished and the compulsory referendum introduced instead. On the other hand, it may be argued that the people's interests will be best guarded if the people instruct the representatives how to vote, as each person cares most for his own interests. Nevertheless, the desire for re-election will usually give the representative sufficient interest in conforming to the wishes of his constituents. The superior educational effect upon the constituencies of carefully deliberating upon specific measures so as either to vote themselves or to instruct their representative, instead of simply making a choice between two or three candidates, can not be doubted, but is probably too small to outweigh the disadvantages mentioned.

**Majority versus Minority or Proportional Representation.**—In most countries members of representative bodies are elected each in a single territorial district, or when elected in larger districts, as earlier in France by the *scrutin de liste*, all members of each party are put on the same ticket, so that the majority of voters are likely to secure all the representatives and to leave the minority unrepresented. For example, in 1892, the Congressional vote of Iowa stood as follows: Republican, 219,215; Democratic, 201,923; Prohibition, 6,602; People's, 13,633. These votes elected ten Republicans and one Democrat, whereas a fair division, according to the relative strength of the parties, would have elected six Republicans and five Democrats. Likewise, in Kentucky, in 1892, 122,308 Republican votes, 179,359 Democratic, 1,559 Prohibition, and 23,735 People's elected one Republican and five Democrats, instead of four Republicans and six Democrats as would have been just. In Maine, 1894, with 65,637 Rep-

1. *Journal of the Proceedings of the General Assembly of the Synod of the Presbyterian Church in the United States of America, 1840.*

Basically speaking, there are two general ways by which plants are reproduced. In the first, a cell or a mass of cells may become detached and grow into a new plant, as in the common cases of the production and development of vegetative in many aquatic plants, of conidia in fungi, and of bud-cells and lateral cankers in many woody dicots and gymnosperms. The case is essentially the same where true buds and even branches separate from the parent plant, as

in the bulblets in the axils of the leaves of some lilies, and in the inflorescences of some onions, the runners of strawberries, the trailing runner-like stems of buffalo-grass, the tubers of many plants, as the potato, and perhaps the spontaneously deciduous twigs of cottonwoods and some willows. In all these cases the essential feature is the separation from the parent plant of one or more living cells, which continue to grow, eventually producing a plant like the parent. We go but a step further when we purposely cut off portions of plants, which are then grown as cuttings by being placed in moist earth. Even the familiar operations of grafting and budding are essentially those of asexual reproduction (Figs. 1 and 2).

FIG. 1.—Asexual reproduction: a, division of *Glorocapsa*; b, formation of zoospores of *Ulithrix*; c, conidia of *Podosphaera*; d, brood-masses of a moss; e, bulblets of lily.

In marked contrast to the foregoing are the various modifications of the sexual reproductive process, in which the essential feature is the union of two cells in the formation of the first cell of the new plant. In the simplest cases two apparently similar cells fuse into one (Fig. 3), but as we

cases the fusion appears to involve the whole of each cell, in the higher plants it is confined to the nuclei.

Upon a close examination of sexual reproduction it is found that in the classes *Chlorophyceae* and *Phaeophyceae* the two uniting cells may be alike in size and other obvious characters (isoga-

FIG. 3.—Sexual reproduction (isogamous): a, fusion of zoospores of *Pandorina*; b, fusion of cells of *Mesocarpus* (highly magnified).

mous), or they may be unlike in size and otherwise quite different also (oögamous). Thus all except the highest *Protococcoideae*, all of the *Conjugatae*, all but the higher *Siphonae* and *Confervoideae* of the first-mentioned class, and nearly all of the second class, are isogamous. In the family *Volvocaceae* (of the order *Protococcoideae*) some genera are isogamous, while others are oögamous. The families *Vaucheriaceae*, *Saprolegniaceae*, and *Peronosporaceae* (of the order *Siphonae*), and *Sphaeropleaceae*, *Cylindrocapsaceae*, and *Cedogoneaceae* (of the order *Confervoideae*), are oögamous. Among the *Phaeophyceae* the *Fucoeae* alone are oögamous. In all classes above the *Chlorophyceae* and *Phaeophyceae* oögamy is the invariable rule.

As we pass from the lower plants to the higher there is an increasing complexity in the results of the cell-union. In the *Chlorophyceae* and *Phaeophyceae* the result is a single egg-like cell (oöspore), which sooner or later develops into one or more new plants (Figs. 3 and 4). The plants of these two classes are hence sometimes very properly called egg-spore plants. In passing to the *Coleochaetaceae* and *Florideae* we find that in the former the single spore soon becomes invested with a cellular layer of protective tissue, and the spore itself upon germination becomes several-celled, thus forming a simple kind of spore fruit. In the *Florideae* the fertilized cell not only divides early, but each segment emits a branch whose end segment becomes detached as a spore, and in the meantime the whole has become invested by a layer of protective tissue. In the *Charophyceae* the growth of the protective tissue precedes fertilization, so that from a protective device which only fol-

[illegible]

the archegonium to the tissues of the parent plant in the young embryo, and in the germinating embryo is a complete vascular tissue system. At the same time in the germinating embryo, with the exception of the haustoriopodia within the apophyses, the root, leaf, and the development of one of two cotyledons. Haustoriopodia, thus, in a great measure preserve in the protective tissue surrounding the embryo. The haustoriopodia develop further in the germinating embryo. The root (caulopodia) begins to grow and undergoes the normal root development. The cotyledons of the embryo in the germinating seed are, as a rule, reflected back by the pedicel when one finds of any embryo that, in the parental tissue, consisting in the development of an embryo plant with its root, stem and leaves. The protective tissue, surrounding the embryo, especially those of the cotyledons, are, however, not only additional much necessary by the fact that the embryo itself is to be protected from the second parent.

When we take a comparative view of several representative countries, we note that, on an average, from the former periods to the latter there is a drop in the rate of increase in the total growth of the parent plant to the new generation. Additional percentage decrease appears and the period of parental care is prolonged to the immeasurably longest elements. See BARNARD'S *Evolutionary Principles*. CHAS. E. BARNARD.

**Reptilia** (Linné Fr. from Lat. *reptilis*, creeping, crawling, dimin. of *repens*, creeping). All serpents, that is, all *con-*  
*stricoides*; a class of vertebrates formerly associated with the *Amphibia*, but now known to be most closely related to the birds and placed with them in a division called *Sarcopterygia* (p. 11). In form as well as in skeletal and other characters they vary greatly, but they may be hardly defined as having a three-fingered foot (nearly completely four-fingered in some cases), an incomplete circulation, arterial and venous blood being mixed in the ventricle, respiration by lungs, functional gills never being developed, and cold blood. The body is covered by horny scales or bony plates. In the dissection essay be noted the suspension of the lower jaw by the quadrate bone, the presence of a single occipital condyle, a well-developed compound bone, and separate coracoid and humeral elements. Most of the species lay eggs, and the embryos, which develop without metamorphosis, have the foetal structures stomach and allantois. See *Amphibryum*.

In most forms the epineuraphous Indians, Hounds, snakes the scales are fairly and undisturbed, passing on the ventral surface in the scales into a wider pharyngeal cavity. In alligators and crocodiles these scales are strengthened by bony growth beneath, while in the turtles the scales have a deep support the peculiarly expanded and united ribs and vertebrae.

In the skeleton, besides the points noted above, may be mentioned the nearly complete ossification of the osseous cartilage being very small. The vertebrae may be concave within in front (*proplethodon*), or behind (*opisthoplethodon*), or on both surfaces (*amphoplethodon*). When appendages are present four or five regions may be recognized in the vertebral column, but when limbs are lacking crushed in each direction are also possible. These regions, which are given the same names as in mammalian anatomy, are exceedingly variable in the number of vertebrae they contain. The skull

which varies considerably in form, usually has the bones distinct. Among the peculiarities separating these from other groups are the union of maxillary and premaxillary bones with the skull, the ossification and more or less complete union of palatine and quadrate with the cranial bones, the presence of a single occipital condyle on the basioccipital, and the distinctness of the bones (dentary, angular, articular, etc.) of the lower jaw. The quadrate bone, by means of which the lower jaw is connected with the cranium, is movable in some forms, firmly fixed in others.

The appendicular skeleton varies with the development of the limbs. A shoulder-girdle is present in all except the footless forms, while the pelvic girdle occurs even in some of these. The limbs vary greatly in character. Usually present and fitted for running or walking, they are modified into paddles in the ichthyosaurs and most *Sauropterygii*, while in the *Pterosauria* the anterior limbs are modified into organs of flight. In some lizards and all snakes the limbs are not developed, while in other lizards one (either) or both pairs are present. It is to be noted that in pythons and boas rudiments of the hind limbs exist. For the classification of Reptilia, see HERPETOLOGY.

Besides the literature cited under HERPETOLOGY, see especially Hoffmann, *Reptilien*, in Bronn's *Classen und Ordnungen des Tierreiches*; Leydig, *Die in Deutschland lebenden Arten der Saurier* (1872); Rathke, *Entwicklung der Natter* (1839); *Schildkröten* (1848); *Crocodile* (1866); Agassiz, *Embryol. of Turtle* (1857); Günther, *Anatomy of Hatteria*, *Phil. Trans.* (1867). J. S. KINGSLEY.

**Republic** [from Lat. *respublica*, commonwealth; *res*, affair + fem. of *publicus*, of the people, public, deriv. of *populus*, people]: a political community in which the sovereign power is lodged in the whole body of the people or in a portion of them, and exercised through representatives or agents directly or indirectly elected by them for that purpose. It is called an *aristocratic* republic when the exercise of the sovereign power is confined to a privileged class of whatever description, to the exclusion of all others; a *democratic* republic when all classes of the people participate in the exercise of that power alike. The purest form of the democratic republic exists where all the people periodically assemble in general meeting to make their own laws and to appoint their agents for the execution and enforcement of those laws—a system which has been found practicable only in small or at least very compact communities, while in larger states the sovereignty of the people can act only through the instrumentality of representation, at present generally adopted.

Of the republics of ancient Greece, Sparta had a strictly aristocratic government, while Athens might have been called a democratic republic but for the circumstance that a majority of its population were slaves, and as such excluded from all political rights, at the time of its greatest prosperity the number of its free citizens being only 135,000, while that of the slaves rose to 365,000. The republic of Rome was, during the first centuries of its existence, aristocratic in its political organization, but in the course of time the patrician aristocracy found itself compelled to yield to the lower orders of the people, the *plebs*, access to the high offices of the government, which thereby acquired a more democratic character; all the while, however, as in all republics of antiquity, a large part of the population remained slaves and without political rights. The Italian republics which became the most flourishing and powerful commercial communities of the Middle Ages—notably Venice and Genoa—were strictly aristocratic; a number of patrician families, who chose from among themselves the head of the government, called the doge, enjoyed a monopoly of political power. The first important republic of the modern era, the United Netherlands—formed, after their separation from Spain, out of seven confederate provinces (1580), and recognized by Spain as an independent republic (1609)—was of a more democratic tendency, as was also the republic or "Commonwealth" sprung from the English revolution, which, however, after an existence of only eleven years (1649–60), was overthrown by the restoration of the Stuart dynasty. Of a similar character were most of the free cities and Hanse towns of Germany, only three of which—Hamburg, Bremen, and Lübeck—have to this time preserved their republican institutions as members of the German empire. Two miniature republics in the south of Europe have survived to our day—San Marino, in Italy, and Andorra, in the Pyrenees—remarkable mainly for their in-

significance as independent states. Spain had, immediately after the abdication of King Amadeus (1873), a short period of democratic republican government, which, however, appeared only as a mere episode in a series of revolutions and reactions. At present there are only two republics of importance in Europe—Switzerland and France. (For the history of the Swiss republic, see SWITZERLAND, HISTORY OF.) The third French republic was proclaimed Sept. 4, 1870, when Napoleon III. had fallen into the hands of the German forces after the battle of Sedan. The National Assembly, organized in 1871, ultimately framed a constitution which went into effect in 1876, and has been in successful operation ever since. It is not unlike the English constitution, with the substitution of an elective president for the hereditary sovereign and an elective senate for the House of Lords. See FRANCE, HISTORY OF.

In America all states except the colonial possessions of European powers have republican governments with democratic institutions. The largest and most powerful of them, the republic of the U. S., presents the realization of the democratic republican idea on the greatest scale.

The distinction between aristocratic and democratic republics has now scarcely more than historical importance, inasmuch as there is at present not a single state with a republican form of government in existence in which a nobility or a privileged class of any description enjoys a monopoly of power; and since the abolition of slavery and the enfranchisement of the colored race in the U. S. there is none in which any considerable class of people is excluded from the exercise of political rights. But while all republics, with a uniform tendency, have drifted toward democracy, as far as the equality of political rights among citizens is concerned, we find an essential difference between them as to the character of their political institutions in another respect. (1) The constitution of a republic may be such as to make the general government in its legislative and executive capacity the depository of the whole sovereignty of the people, so as to give it control not only of national affairs, but also of local administration; or (2) the general government of a republic may be one of strictly limited powers, being confined in its constitutional sphere of action to a certain class of things which concern the nation as a whole, while the administration of affairs of a local nature is left to the "self-government" of the people in their local organizations respectively, with entire independence of the central authority; or (3) these two systems may be so mixed as to leave to the local self-government of the people only a limited range, subject to supervision and interference by the central government. A government of the first description would be called a *centralized*, of the second a *decentralized* government, and of the third either one or the other as it more nearly approaches the first or the second standard. The French republic presents an illustration of the centralized system in a but slightly modified sense, while the so-called *federal* republics—and among them most conspicuously and on the greatest scale the republic of the U. S.—exemplify that which combines the independent administration of local interests by the people in their local organizations with a central government controlling affairs of national concern. For the system of centralization the advantage is claimed that it imparts to the government great power, energy, and rapidity of action by enabling it to employ the whole machinery of general and local administration for its purposes. It is therefore by many thought preferable in a country whose surroundings and international relations are such as to render the possibility of an instantaneous employment of all its resources desirable, or whose internal peace is threatened by a lawless and turbulent spirit, so as to require prompt and vigorous measures for the maintenance of order and security. But while the centralized system thus creates, in the common acceptance of the term, a "strong government" which may be used for good ends, it produces at the same time an accumulation of power which may become, and sometimes has shown itself, very dangerous to popular liberty and to the permanency of republican institutions. The centralized system holds out a tempting prize to popular insurrection at the seat of government, as well as to the *coup d'état* on the part of those in power; and what appears as an element of strength and energy in the government becomes thereby in reality an element of instability. This tendency is the more dangerous as the centralized system fosters among the people the habit of looking for all that is to be done for their interests not to themselves, but to the superior wisdom

rights of the States as to their domestic institutions, but proceeded along the line of least resistance. It did not set out to abolish slavery, but merely to prevent its further extension. The first expressions of this anti-slavery movement, in a national way, were in the Free-soil and Liberty parties, both outside the two great parties and polling only a small vote. They had the effect that a balance of power vote sometimes attains in closely divided States, of defeating one of the great parties with the other, but they achieved little of their direct purpose beyond showing that the Democratic party would stand firm for slavery, and that the Whig party as an organization was useless against it. The anti-slavery vote defeated Clay in 1844, and gave New York to the Whigs in 1848. Even after this the Whigs, accepting the compromise of 1850, still refused to take up opposition to slavery, and the elections of 1852 were disastrous to them. The canvass of the Free-soilers, small as their vote was, joined with the general discontent of the Northern Whigs, together with the helplessness of their party against the slave power, wrecked that great organization in nearly every Northern State. Thus the ground was cleared for the development of a party which should take the place and assume the traditions of the Whigs unencumbered by their obligations to slavery.

*The Formation of the Republican Party.*—As always happens in such periods of political change, the dissolution of the Whig organization gave rise to various side movements, of which the most conspicuous was the Know-nothing or Native American party. This outbreak had a brief and in some places an overwhelming success, but its career was short, for it had no firm resting-place of principle, and did not recognize the great question which was the one then really in the public mind. It served, however, as the recent elections had, to clear the field for the new party organization which the times demanded, and it was in this situation of politics that the Republican party came into existence. It is generally admitted now that the first formal adoption of the name Republican was made by the Michigan State convention early in June, 1854, and that it was due to a suggestion in a letter from Horace Greeley. Certain it is that the name spread rapidly and was adopted by State conventions in Maine, Ohio, Indiana, Illinois, Wisconsin, and Iowa. The new party principle prevailed in the Northern States, and wherever the Republicans ran a straight ticket they carried everything before them. It had looked in 1852, after the Democrats had swept the country without effective resistance from the perishing Whigs, as if resistance to the Democratic party was hopeless, and as if the compromises of 1850 were really built on the rocks and not upon the sands. Yet only two years later this new party, because it gave the first opportunity for an expression of a deep popular feeling and because in the midst of negations it meant something real, carried the Northern States. In spite of its lack of national organization, it elected enough members of Congress to control the House and to choose Nathaniel Banks Speaker after a long and bitter contest. Such sudden success showed how greatly a new means of expression for popular feeling was needed.

Stimulated alike by their victories at the polls and by the Kansas-Nebraska Bill and other measures, which proved that to the South compromises were merely stepping-stones to further aggression, the new party went quickly forward to a national organization. The first convention met at Pittsburgh on Feb. 22, 1856. A national organization was there formed, and a call issued for another convention to nominate candidates for President and Vice-President. This second convention met in Philadelphia on June 17.

The serious character and the importance of the new movement were strikingly shown by the quality of the delegates who assembled in this convention. There were to be seen not only those who had been leaders of the Free-soil movement in the days when it was a forlorn hope, but many men who had been conspicuous in the Whig party, while delegations of Democrats were also present. Edwin D. Morgan, afterward Governor of New York, called the convention to order, Robert Emmett was made its temporary chairman, and Henry S. Lane, of Indiana, its permanent president. The platform was reported by David Wilmot, the author of the famous proviso, and was practically confined to the single issue which had called the new party into existence. It declared against the establishment of slavery in the Territories, and the third resolution, which has become in political literature a familiar quotation, ran as follows: "Resolved, That the Constitution confers upon Congress

sovereign power over the Territories of the United States for their government; and that in the exercise of this power it is both the right and the imperative duty of Congress to prohibit in the Territories those twin relics of barbarism, polygamy and slavery." The fourth resolution discussed at length the condition of Kansas and denounced the Democratic administration for their policy in that Territory. The fifth resolution demanded the admission of Kansas; the sixth assailed the doctrines of the Ostend circular. The seventh and eighth comprised the only portion of the platform which went outside the slavery issue. These two resolutions declared in favor of national aid for a railway to the Pacific coast, and also for liberal appropriations for rivers and harbors. Like all new organizations which are engaged in mustering their forces from different elements of the community, the Republican convention of 1856 had a great deal to say about the issue on which all were agreed and which was the vital question of the day, and very little about other questions of longer standing and upon which there had been earlier party divisions. Nevertheless, these two comparatively unimportant resolutions about railways and rivers and harbors marked at the start the political ancestry of the Republicans, for they commit the party to the doctrine of internal improvement, which was one of the doctrines growing out of the liberal construction of the Constitution, and which had formed the fundamental principle of Federalists and Whigs alike in opposition to the strict construction of the Democrats.

Upon this platform the Republican convention placed as its candidates John C. Fremont, of California, and William L. Dayton, of New Jersey. There was no serious contest over either nomination, but it is interesting to notice that the leading candidate against Dayton for the vice-presidency was Abraham Lincoln, of Illinois. Fremont had no political record, but had been for some little time a popular hero, owing to his exploring expeditions and his brilliant services in California. The event proved that he was a well-chosen candidate for the purpose of getting votes, and the Republican campaign was full of enthusiasm and energy. The Democratic candidate was James Buchanan, who was elected, but the Republicans carried every Northern State except Pennsylvania, New Jersey, Indiana, Illinois, and California, and gave their ticket 114 electoral votes. Of the popular vote the Republicans polled 1,341,264. When it is considered that only four years before all effective opposition to the compromise measures and to the Democratic party had appeared to be extinct, the results achieved by the Republicans in the elections of 1856 were most impressive.

During the next four years events steadily strengthened the Republican cause. The subserviency of Buchanan to the South, the publication of the Dred Scott decision, the continuance of the atrocious Democratic policy toward Kansas, and finally John Brown's raid intensified the hostility of the North to slavery, and day by day added votes to the Republican party.

*The Election of 1860.—The War.*—When the national Republican convention assembled in Chicago on May 16, 1860, they faced a situation very different from that which had confronted them in 1856, and they now saw success well within their grasp. The Democratic party had met in convention on Apr. 23 at Charleston, S. C., and had there split hopelessly on the slavery question. They had adjourned without action and the warring factions had called two conventions, one of which nominated John C. Breckinridge and Joseph Lane on an extreme pro-slavery platform, while the other, adopting the squatter-sovereignty theory, nominated Stephen A. Douglas and Herschel V. Johnson. With their enemies thus divided and with so sure a promise of victory the contest for the Republican nomination was both sharp and determined. The first choice of a majority of Republicans was William H. Seward, of New York, to whom the Eastern States were especially devoted. It was very natural that this should be the case, for Seward had been for years one of the boldest and most effective opponents of slavery, both as Governor of New York and in the Senate of the U. S. He had, however, many active enemies, which a career like his was sure to produce. These men, led by Horace Greeley, united with the Western candidate and thus defeated Seward and secured the nomination of Lincoln. It was the most fortunate choice ever made by a political convention. The often repeated statement that Lincoln was an unknown man, selected merely on account of his availability, is a mistake. He had long been distinguished in the public life of the West. He had been voted for as a candidate for Vice-

publicans swept the country. Lincoln had the electoral vote of every State not in the rebellion, except Kentucky, Delaware, and New Jersey. He received 212 electoral votes against 21 for McClellan. His popular vote was 2,213,665 against 1,802,237. This sweeping victory at the polls confirmed the victories of the armies in the field. Early in the following spring Richmond fell and Lee surrendered at Appomattox. In the midst of the popular rejoicing at the end of the great struggle, which resulted in the preservation of the nation, Lincoln was assassinated by Wilkes Booth on Apr. 21, 1865.

**Reconstruction.**—The death of Lincoln was not only a terrible calamity to the nation, but a great misfortune to the Republican party, for the work of reconstruction which confronted the victorious North demanded both from President and Congress the exercise of the highest wisdom as well as great firmness and moderation. These qualities possessed in an unequalled degree by Lincoln were almost wholly lacking in Andrew Johnson, who succeeded him in the presidency. Johnson was a hot-headed man of unbalanced judgment. He began by taking an extreme position against the South, uniting with the most radical wing of the Republican party, whence opposition to Lincoln had always proceeded. He then suddenly changed his attitude and swung to the opposite extreme, entering upon a policy of ardent opposition to the Republican measures of reconstruction. The effect of this course was to place the party in antagonism to the President, and by alienating all moderate men from the administration, to throw the guidance of the party into the hands of its more extreme members. Such a situation was most unfortunate for the country, and could not fail to damage the work of reorganization. Nevertheless, the party succeeded in passing its reconstruction laws, which gave a vote to all men in the South, black and white, except those who had participated in the rebellion. The Republicans also passed the Fourteenth Amendment to the Constitution, which established the freedom of the Negro and provided that no debts contracted in aid of the rebellion should be paid by the U. S. or any State. All these great measures were forced through over the President's veto, and the bitterness between the President and the Republican party reached such a point that in Feb., 1868, the House of Representatives impeached him, resting their charges on his illegal removal of Stanton, his attacks upon Congress, and his stopping the execution of some of the acts of Congress. The President was acquitted, the vote standing guilty 35, not guilty 19—not a two-thirds majority, as required by the Constitution.

In that same year a new presidential election came on. President Johnson's efforts to build up a personal party failed as completely as those of Tyler under like circumstances. No one followed him and neither of the great parties would have anything to do with him. The Republican party met in Chicago on May 20 and nominated Gen. Grant for the presidency by acclamation. Schuyler Colfax, of Indiana, was nominated for Vice-President on the fifth ballot. The Democratic national convention met in New York on July 4, and nominated Horatio Seymour for President and Francis P. Blair, of Missouri, for Vice-President. The Republican platform sustained the Constitutional amendment, which recognized the results of the war, and the freedom of the slave, and which guaranteed protection to the Negro in his rights. They also sustained the reconstruction acts of Congress, pledged themselves to maintain the national credit and to provide for the soldiers, and denounced all forms of repudiation which had been much advocated by the Democratic leaders.

The Democrats took ground against this platform, and showed by their attitude and their nominations alike their hostility to the Republican policy. The people, however, wearied by four years of war and by the angry struggles with Johnson, were anxious above all things for a final settlement of these war issues. Gen. Grant tersely summed up the situation in his famous phrase: "Let us have peace." This became the watchword of the contest, and the Democratic campaign really broke down before the polls were reached. Gen. Grant was elected by a popular vote of 3,012,833 against 2,703,249, receiving in the electoral college 214 votes against 80 for Seymour. This election was decisive in favor of the acceptance of the results of the war, and drove the Democrats from any further attempt to take ground against them. It also sustained the Republican policy of equal suffrage and the rights of citizenship to all citizens without regard to color, and this policy was finally

secured by the Fifteenth Amendment to the Constitution, which soon after passed Congress, and, after ratification by the States, was proclaimed on Mar. 20, 1870.

Under the administration of Gen. Grant the leading question was the condition of the Southern States under the Reconstruction acts. The State governments which were then set up, resting on the black vote, were generally feeble and gave rise to many scandals. On the other hand, the murderous outrages committed by the Southern whites against all Republican voters angered the North and kept all the States lately in rebellion in a condition of disorder which invited the constant interference of the national authority. From every point of view the situation in the Southern States was depressing, and the dissatisfaction which it caused was directed very naturally against the party in power. This period also was one of general demoralization, the inevitable outcome of four years of fierce civil war, and the demoralization extended not only to politics but to business and society. It gave birth to wild stock speculations and to many scandals and corruptions, and the burden of these also fell, as it was sure to fall, on the party in power.

**The Liberal Republican Movement.**—The discontent thus engendered took shape in an independent movement in the Republican party headed by a number of Republican leaders who had broken with the administration on account of the San Domingo policy of Gen. Grant, and who were also desirous of attacking the abuses and corruptions to which the war period had given rise. These dissatisfied or Liberal Republicans, as they called themselves, held a national convention in Cincinnati in May, 1872. The plan was to nominate Charles Francis Adams for the presidency, a selection which would have made the movement a formidable one, but the convention broke away from the leaders and nominated Horace Greeley for President and B. Gratz Brown for Vice-President. They declared in their platform that sectional issues should be buried, that all the settlements of the war should be accepted, that civil-service reform should be begun, and that specie payments should be immediately restored. They left the tariff an open question and opposed all further grants of land to railroads. The regular Republicans met in Philadelphia in June and renominated Gen. Grant by acclamation, placing with him on the ticket Henry Wilson, of Massachusetts, for Vice-President. Their platform was more elaborate and touched upon more questions than that of the Liberals, but on those subjects in regard to which both platforms spoke the declarations were in principle the same. The regular Republicans reviewed the history of their party, demanded the acceptance of the results of the war and the protection of the colored voter, opposed grants to the railroads, and favored the reform of the civil service. They denounced the repudiation of the public debt and supported specie payments. The Liberals had left the tariff an open question, but had nominated a high protectionist as President. The regular Republicans declared squarely for protection, which had always been one of the cardinal principles of the party.

The Democrats met in July at Baltimore, ratified the nomination of the Liberal Republicans and adopted their platform. Thus they accepted as their candidate for the presidency a lifelong opponent, who had been an extreme abolitionist and was always a zealous protectionist, while they adopted as their platform a set of Republican principles in no one of which they believed. The result of such a performance it was not difficult to foresee. On the one hand it demoralized the Democratic party, while on the other the absurdity of the whole position prevented any serious break in the ranks of the Republicans. A straight-out Democratic ticket, nominated at Louisville in September, came to nothing and played no part in the election. Grant carried every State, except Georgia, Kentucky, Maryland, Missouri, Tennessee, and Texas. His popular vote was 3,597,070 against 2,834,079 for Greeley. In the electoral colleges Grant received 286 votes against 80 thrown for various candidates, Greeley having died between the election and the meeting of the colleges.

Although the Liberal movement broke down so completely in the presidential campaign, it made itself felt very strongly two years later, stimulated as it was by scandals which were connected with appointees and friends of the administration. During the preceding years, moreover, owing to the business disasters which followed the panic of 1872-73, a strong movement for "cheap money"—that is, for the unlimited issue of greenbacks—had grown up in certain States. Gen. Grant's veto of the inflation act of 1874, fol-

tion of lapsed land grants. It favored also liberal pensions and the building up of the navy, and declared against Chinese immigration, and fraud and violence in the South. The leading resolution, however, concerned the tariff, which of late years had been coming more and more steadily to the front, and upon this the Republican party took, as it had always taken, bold and advanced ground in favor of protection to American industries. The Democrats met on July 8, at Chicago, and nominated Grover Cleveland for president and Thomas A. Hendricks for Vice-President. The platform declared in favor of reform in general after the manner of opposition platforms, but most particularly for tariff reform.

Platforms, however, played but little part in the exciting and bitter campaign which followed. There was a great deal of Republican opposition to Blaine, especially in the Eastern States, where it took the form of an open revolt of a most serious character against the Republican party. Although the Republicans tried to fight their battle on the tariff issue, this revolt made the campaign a purely personal one, and it had all the odious features of savage abuse of the candidates, which such contests are sure to engender. Issues were lost sight of, and the struggle finally turned solely on the question whether Blaine should or should not be President of the U. S. Despite the great schism, Blaine's personal popularity was so great that he attracted large bodies of Democratic voters and made up the Republican losses. New York, which decided the election, gave Cleveland, instead of the 192,000 plurality, which he had received in 1882, less than 1,200, and it was by many persons believed that even this narrow margin was obtained only by counting in New York city for Cleveland the vote cast there for Gen. Butler, who ran as an independent candidate for the presidency. In the electoral colleges Cleveland and Hendricks received 219 votes against 182 for Blaine and Logan. During the first two years of Cleveland's term the general talk in favor of reform went on, but very little was accomplished of a specific kind, and the fact that the Senate remained Republican prevented any violent legislation, if such had been desired. The elections of 1886 went against the Democrats, but they still retained control in the House by a narrow majority. The failure thus far to accomplish anything led, however, to a new departure. President Cleveland sent in to the Fifty-third Congress a message devoted to the single subject of the tariff and demanding instant and radical reductions. This message resulted in the introduction of the Mills Bill, which the House debated at great length for three or four months. It passed the House on July 13, 1888, and on the issue thus raised the two great parties appealed to the country.

*The Administration of Harrison.*—The Republicans met on June 19 at Chicago. Blaine withdrew his name, and on the eighth ballot Benjamin Harrison, of Indiana, was nominated for President, and this was followed by the nomination of Levi P. Morton, of New York, for Vice-President. The Republican platform favored bimetalism, the building up of the merchant marine, the admission of new States, and the reform of the civil service. It attacked the Democrats for their failure to settle the fishery question and for their feeble foreign policy, but, as in 1884, it made the tariff the leading issue, and declared more uncompromisingly than ever in favor of protection.

The Democrats met in July at St. Louis and nominated Grover Cleveland for President and Allen G. Thurman, of Ohio, for Vice-President. They too made the tariff the leading issue, and, although they did not declare for absolute free trade, they demanded such heavy reductions that the practical result would have been the same. The campaign turned on the issue of protection or free trade, and the Republicans were victorious throughout the Northern States, except in Connecticut and New Jersey. They also carried the House and kept their hold upon the Senate. They were therefore in control of every branch of the Government, and the Fifty-first Congress, which followed, was a remarkable and memorable one.

The first great contest was in the House of Representatives, where the Democratic minority undertook by the use of the rules to prevent the transaction of business. Thomas B. Reed, of Maine, was elected Speaker, and under his lead a reform of the rules was accomplished, which gave the majority power to act. Reed's policy and rulings were the subject of bitter attack, but every one of his principles has since been adopted by the Democrats themselves and sustained by the Supreme Court, thus completely vindicating his action. The Republicans were in this way enabled to

pass a large amount of most important legislation. To this Congress is due the international copyright law, a long-delayed measure of justice and good sense. To it are also due the inspection laws which opened the markets of Europe to the meat products of the U. S., generous appropriations for building up the navy, and mail subsidies to develop steamship lines. Many other valuable measures of a non-political character were also carried through. The two great party measures were the bill to regulate national elections, which passed the House and failed in the Senate, and the new protective tariff, which became law on Oct. 1, 1890. In the elections which followed for the House of Representatives, the Republicans were very badly beaten. The amount of legislation which they had secured brought, as it always does, reaction and opposition, but the chief cause of their defeat was the outcry raised against the McKinley Act on the ground that it was too extreme and that it would raise prices. During the remaining years of President Harrison's administration the fact that the two Houses were controlled by different parties prevented action.

*The Campaign of 1892.*—In 1892 the Republican party met in convention at Minneapolis, and after a contest caused by the hostility to the administration among many party leaders, President Harrison was renominated and Whitelaw Reid, of New York, was put on the ticket with him as Vice-President. The Democrats renominated Grover Cleveland, who was bitterly but unavailingly opposed by the delegates from his own State, and nominated with him for Vice-President Adlai E. Stevenson, of Illinois.

This campaign, like the preceding one, turned upon the question of the tariff, the McKinley Act furnishing the text as the Mills Bill had done in 1888. The Republicans made a partial recovery from the disasters of 1890, but were nevertheless decisively beaten, several Northern States giving their votes to the Democrats for the first time. In the electoral colleges Cleveland and Stevenson received 277 votes to 145 votes for Harrison and Reid, and 22 votes for Weaver and Field, the Populist candidates. The Democrats also carried both the Senate and the House, and on Mar. 4, 1893, came for the first time in thirty-five years into full control of all branches of the Government. In April a business panic began, which reached in the following summer great intensity. The Democrats declared that this was due to the existence of the Sherman Act passed by a Republican Congress as a compromise measure, providing for the purchase, by the Treasury, of \$4,000,000 of silver bullion every month. President Cleveland called Congress in extra session on Aug. 7, and after an obstinate struggle of three months the purchasing clauses of the Sherman Act were finally repealed by a combination of Republican and Democratic votes, but the repeal, which was a wise measure, did not relieve or improve business. The business depression still continued while the Democrats were engaged in a revision of the tariff, which bore no resemblance to the promises of their platform, and the Republican party made large gains at all the by-elections. At last in August the Democrats passed their Tariff Bill just as it came from the Senate, where the House bill received over 600 amendments of a protective character. The President refused to sign the bill, and, after denouncing it in the severest terms in public letters to two members of the House, permitted it to become law without his signature. In the general elections of Nov., 1894, the Republicans appealed to the people against the Democratic failure in the matters of tariff and finance, the business disasters they had caused, and also against their feeble and blundering foreign policy. The Republicans carried the elections overwhelmingly, gaining over 100 seats in the House and seven seats in the Senate. H. C. LODGE.

**Repudiation** [from Lat. *repudiare*, divorce, reject, scorn, repudiate, deriv. of *repudium*, a casting off; *re-*, back + *pudē*, it shames]: an act by which an administration declines to be bound by the debts contracted by the governments which have preceded it. In European history there are numerous instances of a government annihilating a portion of its debt by converting it into a lower denomination, and similar instances have occurred in Mississippi and Pennsylvania.

**Requisitions** [from Lat. *requisitiō*, a search for, requirement, deriv. of *requirere*, search for, require; *re-*, back, again + *quaerere*, *quaesitum*, seek, ask]: (1) formal demands by one government on another for the extradition of criminals (for treatment, see EXTRADITION); (2) in the international laws of war, demands for necessities by an invader on an

tains that he will "not due of compensation to have to be ready to return, and further shall be exempt from its jurisdiction." Of course, both parties will most naturally claim maximum compensation as enemy's franchise from taxation from the moment on from the instant that the ship is in the sea for its support and maintenance but these requirements ought to be limited to things immediately indispensable. At times, as at Monterey, captured ships contribute part of their own and even nothing or have without necessitating force when both the property, except on these occasions, when it is not possible to find out the owner. These cases, when, to the power of the international declaration concerning the capture and seizure of war interrupted at Monterey in 1846, which differs somewhat from the present system had by Espinosa in the same case, such products and for the better to ensure in a provision, containing the following provisions: Art. IV: "As private property ought to be respected, the enemy shall not detained goods, consumable materials from the merchandise of war, or necessary except such as relate to the maintenance of war, already acknowledged and are part of the means to the resistance of the country, and which are not things that the population the obligation to take part in the war against the country." Art. VI: "The enemy bearing contributions, whether as an equivalent to losses or to satisfy debts to the forced loan or forced, on the way of more, should possess them, as far as possible, only according to the rules of necessity and the principle of proportionality, and the right of the enemy to demand a receipt shall be given to the person making the payment." Art. VII: "Requisition should be made only with the authorization of the commanding of the locality occupied. For every requisition an inventory shall be granted as a receipt obligation." A part of the business project which has not accepted is mostly of military, Art. IX: "The owner, as claimed from the local population all the troops, services, and stores, in kind or in money, to which the exercise of the legal government have a right." See *Wang's Introduction to International Law*, 2 ed.

Resaca de la Palma, between Los Chichas and San Juan, Sonora, and Resaca de San Pedro, a distance of 10 miles to the Southern Texas, 1 mile S. of Matamoros, Mexico. After his victory at Uta Alta May 9, 1846, Gen. Taylor, with 2,000 troops pursued the Mexicans 4000 to 5,000 commanded by Arista to this place. On the 16 he attacked and completely defeated them capturing all the artillery and 5000.

[illegible]

**Reservoirs** (from Fr. *reservoir* = Lat. *lat. reservatio*, reservation, store, of *reservatio* keep, store up; see back, up *reservoir*, keep): In engineering, a lake or basin for holding water close with appliances for regulating the outflow of water at different rates from the inflow, thus enabling either a fixed or more regular supply to be distributed at irregular intervals of time or an irregular supply to be distributed at a uniform rate. Of the first class are what are termed *storage reservoirs*, which are generally constructed on the course of a stream by the erection of a dam, enabling the constantly flowing water to be impounded when it is in excess of the quantity needed for regular use and to be drawn off when the natural flow of the stream is less than the average demand. *Flowing reservoirs* of this kind were constructed in India and in Egypt at periods antedating any historical records, and many of them are still used.

for their original purpose of making agriculture possible in regions where the seasons of rainfall and of the growing crops are separated by a considerable interval of time, while of many others traces alone remain. It is claimed that in Egypt the building of such reservoirs may in all probability be traced back to the days of the patriarch Joseph. In India there remain traces of the Poonairy reservoir, which by the construction of 30 miles of dams flooded 40,000 acres of land, and the Veeranum reservoir, which flooded 22,000 acres. The great Mudduk Masoor reservoir in India, constructed in the fifteenth century, was 108 feet deep, flooded 26,000 acres, and held 280,000 million gal. In the island of Ceylon there is an ancient reservoir covering an area of 10,000 acres.

No reservoirs of such magnitude as these have been constructed for several hundred years, but there are many thousand smaller ones. In Madras alone there are 50,000. In the nineteenth century the largest have been built by the British in India for storing water for irrigation, and several of considerable size have been constructed in California and New Mexico for the same purpose. A number of large reservoirs have been built in Spain, also for irrigation. In the rest of Europe and in the eastern portion of the U. S. the principal purpose for which storage reservoirs have been constructed is the supply of water to cities, and a large number of such have been built.

The question of the capacity necessary to insure the most economical results in reservoirs fed by streams which are subject to great variations of flow and the water of which is to be used for supplying the demands of a population which is constantly increasing and which at the same time is irregular in its requirements, has received careful study from civil engineers. The determination of this question involves considerations of climatic peculiarities, the relation between different topographical and geological conditions and the amount of water which a watershed will annually yield to a stream, and the rate at which at different seasons of the year a given population will consume water. The general conclusions reached by hydraulic engineers with reference to the economical dimensions of storage reservoirs for city water-supply in the temperate zone are that such reservoirs should contain a quantity of water equivalent to one-half of the total annual consumption anticipated in the city, and that the greatest efficiency can be obtained from any reservoir when its capacity is about 100 million gal. for each square mile of territory from which its supply is derived.

Among the largest storage reservoirs for water-supply to cities are the Vyrnwy for Liverpool, containing 11,900 million gal.; the Vehar for Bombay, containing 10,800 million gal.; the San Mateo for San Francisco, holding 31,000 million gal.; the Yan Yean for Melbourne, Australia, 6,400 million gal.; on the Croton river, New York, the Boyd's Corners, 2,727 million gal.; the Middle Branch, 4,004 million gal.; the East Branch, 9,028 million gal.; the Titicus, 7,000 million gal.; the Carmel, 9,000 million gal.; and the new Croton, begun in 1894, to hold 32,000 million gal. There are numerous storage reservoirs for other cities in both Europe and America holding from 500 to 1,000 million gal. See the article RESERVOIR DAMS.

For the immediate daily demands of cities service reservoirs are required, and their capacity need not be much in excess of a single day's supply, their function being merely to keep the supply constant during the varying draughts at different times of day and different seasons of the year. They are generally located as near the center of distribution as practicable, and the water furnished to them by gravity from storage reservoirs or by pumping from the source of supply. Wherever possible, they are constructed on a summit by excavating sufficient material to make an embankment around the pit, and thus give the greatest capacity at the highest elevation. The largest reservoir of this type is in Central Park, New York city, and covers 96 acres and contains 1,200 million gal. A good example of a service reservoir constructed entirely above the surface of the ground with masonry walls is the Murray Hill reservoir in New York city, which is 400 feet square and holds 24 million gal. In many cases of small supply in flat regions service reservoirs are iron tanks or stand pipes from 5 to 40 feet in diameter and 50 to 250 feet in height. A fine example of such a reservoir is at Princeton, N. J., where a tank 20 feet in diameter and 60 feet high is placed on an iron trestle 60 feet high. On top of the tank is a meteorological observatory.

J. JAMES R. COLES.

**Reservoir Dams:** artificial structures built across valleys through which streams flow, for the purpose of obstructing the natural flow of the water, raising its level, and thereby forming lakes or reservoirs. The simplest dam is one formed by filling a narrow gorge between high banks with loose rock and stones and gravel and then permitting the interstices to become clogged by the sediment brought down by the stream in freshets or by earth thrown in above the dam for the purpose. This method has been adopted even in works of recent construction in the western parts of the U. S., but such dams have in several instances been destroyed by freshets.

Where this crude method seems impracticable or injudicious and yet small expenditure is essential, dams are built of a cribwork of timber filled in with stones and sometimes faced with plank with close joints and frequently backed up with earth. There is a dam of this type, 1,017 feet long and 28 to 32 feet high, across the Connecticut river at South Hadley Falls, Mass. In such dams as those above named the water of freshets in the stream may be allowed to flow over the top of the dam. In cases where the water of freshets can be carried off by an independent channel, the best form of construction of a dam not exceeding 40 to 50 feet in height is usually an earth embankment, the width at the bottom being from three to four times the height of the dam. It is essential to the safety of a dam of this kind that its foundations should be made secure against the percolation of water through the bank, that the bank should be built of selected material put on in thin layers and thoroughly moistened, rammed, and rolled, and that the face of the dam on the water side should be protected with a stone paving. Owing to the difficulty of making an earthen dam under heavy pressure absolutely tight, it is customary to build in the center of the embankment a wall either of puddle clay or of masonry. The neglect of proper precautions to prevent the percolation of water through high earthen dams, either with or without masonry heart walls, has resulted in severe disasters, such as the failure of the Dale dyke at Sheffield, England, in 1864, the Mill river dam in Connecticut in 1875, the Worcester dam in Massachusetts in 1876, the South Fork dam at Johnstown, Pa., on May 21, 1889, the Pottsville dam in 1892, and the Portland, Me., reservoir dam in 1893. There are in the U. S. ten earthen dams more than 60 feet high for waterworks, two of which—the dam at Pilarcitos, Cal., 95 feet high, and that at San Andreas, Cal., 98 feet high—have no central wall either of puddle or masonry. The highest is that at Druid Lake at Baltimore, which is 119 feet high and has a puddle heart wall.

A structure of water-tight stone masonry is the type of dam which is most susceptible of being built on scientific principles, so that the minimum amount of material may be used with the maximum beneficial effect. The earliest application of masonry to the construction of large dams is believed to have been made by Spanish engineers about the middle of the fifteenth century. The dam of Almanza, 69 feet high with a thickness of 10 feet at top and 34 feet at bottom, has stood for over 300 years, and sustains a greater pressure per square foot than any other reservoir dam or than is considered prudent in construction at present. The Alicante dam, 141 feet high, is still in use, creating a reservoir for irrigation which holds 975 million gal.

In France the earliest high masonry dam was built at Lampy about 1776. Several others were constructed during the first half of the nineteenth century. All the masonry dams over 50 feet in height built prior to 1850 are believed to be as follows:

| NAMES.                | Date.   | Height. | THICKNESS |         |
|-----------------------|---------|---------|-----------|---------|
|                       |         |         | Top.      | Bottom. |
| Almanza, Spain        | 1560-65 | 69      | 10        | 34      |
| Alicante, Spain       | 1579-94 | 141     | 66        | 111     |
| Elche, Spain          | 1590    | 76      | 30        | 40      |
| Huesca, Spain         | 1690    | 66      | 36        | 53      |
| Lampy, France         | 1776-82 | 53      | 16        | 37      |
| Puentes, Spain*       | 1785-91 | 165     | 36        | 146     |
| Val de Inferno, Spain | 1785-91 | 116     | 41        | 138     |
| Grois Bois, France    | 1830-38 | 93      | 21        | 46      |
| Chazilly, France      | 1840-45 | 74      | 13        | 53      |
| Nijar, Spain          | 1843-48 | 101     | 24        | 68      |
| Zola, France          | 1843-50 | 120     | 19        | 42      |
| Lozoya, Spain         | 1850    | 105     | 22        | 128     |

\* Failed.

It will be observed that there is a great difference in the proportions of these dams, displaying great diversity of opinion among the engineers who designed them. It was not

**Resilience** [from Lat. *resili're*, spring back; *re*-, back + *salire*, leap]: the capacity of a material to resist shocks or repeated stresses, the measure of which is one-half the product of the force by the linear elongation or compression produced, provided the material is not strained beyond the elastic limit. Thus if two bars of metal stretch 0.03 and 0.06 inches under tensile stresses of 1,000 and 2,000 lb. respectively, their relative resiliences are as 0.03 by 1,000 to 0.06 by 2,000, or as 1 to 4. The modulus of resilience is the resilience for a bar 1 inch in length and 1 sq. inch in cross-section when the stress is equal to the elastic limit of the material. Approximate average values of the modulus of resilience for timber, cast iron, and wrought iron are 3, 1, and 12 inch pounds respectively. The total work done in rupture of a beam or bar is called its ultimate resilience. See **STRENGTH OF MATERIALS**. MANSFIELD MERRIMAN.

**Resina**: town of Italy; province of Naples; 5 miles S. E. of the city of Naples; at the foot of Vesuvius between Portici and Torre del Greco (see map of Italy, ref. 7-F). It is built on masses of lava which cover a large part of ancient Retina and Herculaneum. The sinking of a shaft here in 1709 led to the discovery of remains of the theater of Herculaneum 90 feet below. In the vicinity are many attractive villas, the most frequented being La Favorita, the principal hall of which is inlaid with marbles from the palace of Tiberius at Capri. Pop. 13,626. E. A. GROSVENOR.

**Resins** [viâ O. Fr. from Lat. *resina*, from Gr. *ῥηῖν*, resin, pitch]: a class of bodies that occur very widely distributed in plants mostly together with volatile oils, dissolved in which they frequently flow from trees accidentally or intentionally cut. Crude resins are never crystallized, but have the form of drops, like gum. They are generally colored yellow. Most resins consist of several simple compounds which, however, as a rule, can not be separated from one another. The number of resins is very large. They are used for preparing VARNISHES (q. v.), sealing-wax, soap, for stiffening hat-bodies, etc. The most important are AMBER, COPAL, DAMMAR, DRAGON'S BLOOD, MASTIC, LAC, ROSIN (or colophony), and SANDARACH (qq. v.). See also GUM-RESINS. IRA REMSEN.

**Resolution of Forces**: the mathematical separation of forces into component parts; the converse of COMPOSITION OF FORCES (q. v.).

**Resolution of Rotations**: See MOTION.

**Resorcin** [*resin* + *orcin*], or **Resorcinol**:  $C_6H_4(OH)_2$ , a diatomic phenol prepared on the large scale by the action of caustic soda on benzene-disulphonic acid. It is soluble in water, alcohol, and ether, and is used for preparing fluorescein, eosin, and other phthalic acid colors. See PHTHALIC ACID.

**Respiration** [from Lat. *respiratio*, breathing, deriv. of *respirare*, breathe, inspire and expire; *re*-, again + *spirare*, breathe]: the special function of the lungs, the process which has for its ultimate object the supplying of red blood-globules with oxygen for transmission to the various parts of the body. To accomplish this result, atmospheric air must be introduced frequently and continuously, an extensive surface of contact for air and blood must exist, and the effete products of the chemico-vital interchange must be exhaled.

The physical act of respiration or breathing embraces two parts, inspiration and expiration, and there are two distinct methods of breathing, the abdominal and the thoracic. In abdominal breathing the muscles of the abdomen by contraction force the viscera upward against the diaphragm, which becomes arched into the thoracic cavity and forces the air out of the lungs. Then the diaphragm, contracting, pushes the abdominal viscera downward, and thereby makes room for entrance of inspiratory air. In the thoracic type of breathing various external muscles elevate the ribs and sternum, and thus materially increase the chest capacity, causing inspiration. This completed, the weight of the chest walls, with the assistance of certain muscles, causes descent of the sternum and ribs, and, in conjunction with the natural contractility of the lung substance, forces the air out. The abdominal type of breathing is predominant in men, the thoracic in women.

Respiratory action of the lungs is involuntary, although it may be voluntarily modified. The *besoin de respirer*, or involuntary incentive to breathe, is the result of impressions received by the medulla oblongata from the several regions of the body, which constantly demand oxygen, and

transmitted to the respiratory muscles of the thorax and abdomen. From eighteen to twenty respiratory acts take place per minute, at each of which an average of about 26 cubic inches of air is inspired and expired. This definite volume of air which ebbs and flows is termed *tidal air*. In addition, fully 100 cubic inches of air, unaffected by respiratory movement, remains in the smaller bronchi and air-sacs, and is termed *residual air*. Tidal inspiratory air is fresh and pure; it enters as far as the fourth divisions of the bronchi, and becomes a part of the relatively impure residual air. Tidal expiratory air contains carbonic-acid gas, which is exhaled and removed from the body. Each inspiratory act, therefore, adds an increment of oxygen to the bulk of air in the lungs; this oxygen, by the law of diffusion of gases, permeates the residual air and reaches the air-sacs. The air-sacs are thin-walled; indeed, their walls are essentially a network of capillary vessels held together by a film of elastic tissue. In the aggregate, the walls of the innumerable air-sacs constitute a surface of many hundred square feet, upon which the *rete mirabile* or delicate network of capillary blood-vessels is spread. The pulmonary artery brings impure or venous blood to this extensive surface, carbonic-acid gas is exchanged for oxygen, and the purified, reddened, oxygenated blood is returned by the pulmonary vein to the left side of the heart, thence to be propelled through the entire circulation. The red blood-globules are the carriers of oxygen, and the full object of the preliminary respiratory efforts and the intermediate chemico-vital interchange is really attained as these red globules yield their quota of oxygen to the cells and tissues which constitute the body. For a description of the respiratory organs see HISTOLOGY; for artificial respiration see RESUSCITATION; and for respiration in animals see ANATOMY, COMPARATIVE. See also RESPIRATORY SOUNDS.

Revised by W. PEPPER.

**Respiration** (in plants): See PHYSIOLOGY, VEGETABLE.

**Respirators** [from Lat. *\*respirator*, one who breathes, deriv. of *respirare*, breathe]: mouth-pieces of fine gauze and cloth, to be worn by persons with diseased or weak lungs to prevent the ingress of cold and damp air or foreign matter, as smoke, dust, or the grit of stone. They are little used in the U. S., but are much employed in Great Britain, especially by grinders and stone-carvers, and wherever the air is permeated by impalpable particles.

**Respiratory Sounds** [*respiratory* is from Lat. *respirare*, breathe]: the sounds produced by inspiration and expiration, as heard by the method termed auscultation, the application of the ear to the chest directly, or indirectly through the medium of the stethoscope. If the entire period of a respiratory act be represented by ten, inspiration will occupy five-tenths of this period; expiration immediately follows during the succeeding four-tenths; and finally a period of silence and rest from breathing during the supplementary period of one-tenth. During the entire period of the inspiratory act the ear applied to a healthy chest detects a clear, full, breezy, or blowing sound, gentle at its commencement, full and well defined at its middle, and graduated and faint as it is terminating. The inspiratory sound is soft and low-pitched in adults; in children is ruder and exaggerated, possessing tubular or friction quality. Expiratory sound is comparatively faint, occupying but a small part of the period of the expiratory act. It also is soft and low-pitched, but more feeble and distant than inspiratory sound, since the recedence of expired air from the chest-walls conducts the sound-waves away from the ear of the listener. Expiratory sound is loudest at its commencement, just as the transition from inspiration has taken place, and gently graduates until it ceases. Inspiratory sound is the result of air-friction with the system of bronchial tubes through which it passes. Hence inspiration is a compound sound, possessing an element of laryngeal origin, elements of sound developed in the trachea, the large and small bronchial tubes, and especially where the tubes bifurcate; and finally an important element developed by the entrance of air into the numberless air-sacs or pulmonary vesicles. This vesicular element of inspiratory sound is a test of the healthy lung. Departures from the normal respiratory sounds are evidences of bronchial, pleural, or pulmonary disease. The sounds are harsh in early bronchitis, replaced or accompanied by *râle* or musical sounds in advanced bronchitis; they are masked or completely obscured by pleurisy; their inspiratory and expiratory periods have changed relations and qualities in asthma and emphysema; and in

[illegible][illegible][illegible]

1984, pp. 149-154, West. Canada, 1984, vol. 16, pp. 1-11. It was believed to consist of 700 birds, and appeared in the species catalogue of the 1984-85 season with 10,147, 20. It was a through-the-mount and Plumbeous, but was rejected by the curators. It was later re-examined at the 5th Yearling event by 4 birds and the specimen was found to be a Red parrot and again the fourth and a prominent immature Red-tailed bird in

As held men, they distributed seeds on the second plantation. Inevitably, but not to the satisfaction of Father. Hearing of the third one that was built on the back of what, though he believed me to be mostly of lying, was the most honest body I had ever met. He was now taken to different places and our conversations became of no use. The period of lying, or simulation, had not been time and information, it was a mere and a shadow of it. In conclusion, on the necessity and advisability of the people who had been brought with him for these years, who were at first conversions and so encouraged, and showed their gratitude by doing for his children, and when they arrived on the bottom of the journey and therefore, who were persons of no higher character and piety, of industry, and generally of some good nature. Who tried to build up the faith and to cheer them. They came upon the oppressed victim of the only Ahab's, the gift of the Holy Spirit according to Father's promise. The promise given in the mission, the institution of the Lord's Day, and the Christian education. It is impossible that in this matter there should have been a necessary, orderly, religious and dispositive, or imperative. The fact is beyond doubt. It was the indulgence of prophetic and promise, the realization of the past, I think I can say that, and not the future, and the conversion and the growth of them of Christ's more or less, part of the expectation, the first building up to his heavenly work and completion of the time.

The New Testament teaches that at the death of a man at the first day of his burinment, the spirit leaves the body as punishment. It speaks of the resurrection of the dead as from the dead, not of the body, *ex mortuis*, of the dead *interior* man. The words and symbols of the Church have generally used the *grosses* from the resurrection of the dead. The Greeks and Manichaeans rejected the phrase *Ex mortuis*, like the Oriental heretics and the Unitarians, whom they considered as materialists, they disposed *ex vivo* the term of a material spiritual resurrection. Most of the Fathers had the same view, especially when the early period of the Church is discussed. Augustine first reaffirmed the distinction between the resurrection of the body and the Most, between the *grosses* and the philosophical form. Augustine held an inner and spiritual view, although in the same time, though not in the gross form. The Alexandrian and Eastern schools hold the spiritualistic view—the Western schools are liberal. The Hellenes fairly passed toward Origen's interpretation.

The doctrine is justified by reference to Christ's saying under Transfiguration: "I shall send you forth as I have been sent." If it is concluded by two that this is a fortunate person, there is really as well as spirit. He has been distinguished by the understanding his removal of life by music and plants. The measure, the morning, the evening music are bodily acts.

Apprentices in the U. S. have indicated that they find a hardy rose suitable (1) for commercial use as a cover for the hilled areas from soil erosion, (2) for use as a shrub, or (3) from the attractiveness of the flowers and to be disappointed in their prospects or hopes, or (4) to meet the production of the downy mildew, or (5) to use as a hedge, or (6) as a display of the most difficult, or (7) of the regeneration of seeds, or (8) of the young tree, or (9) of the range of seeds from India to Japan.

The resurrection of Christ is treated as the fountain type, and power of a new life—the master stamp of the Christian system, without which everything fails. It is related closely to every doctrine, and has always been a chief point of attack. The doctrine of the resurrection meets our desires and our intensest belief in our best-possible personality. It is part of the attitude of the soul from which, under the sacrament of grace, the whole of human nature is to be disordered and refitted to Christ. It gives dignity to the body which was created by God, redeemed by Christ, and is the "temple" and organ of the Holy Spirit. It gives hope and comfort—equal, in part, from the terror of death. It shows the power, love, and truth of God, fulfils the promise—and prophesy, confirms the inspiration of the Scriptures; as a sign of immortality, shows that the soul and body

united in sin and redemption, will be united in judgment and glory or shame. It confirms the divinity of Christ and his atonement, and is intimately related to justification, faith, repentance, sanctification, and the whole Christian system. It is the foundation of the Christian week and year.

The resurrection implies the continued identity of the body—that the future body is in essence identical with the present body, one being the veiled germ, the other the glorious development. Concerning identity, it has been taught that (1) all the particles of matter that have ever been in the body are brought together again; (2) only the particles present at death; (3) certain more enduring parts are preserved, as an indestructible corporeal germ from which is made by divine power an organ of the soul adapted to its higher condition; (4) some of the particles remain, however few; (5) there is a "vital germ"; (6) a spiritual, "ethereal, luminous" body is evolved at the moment of death; (7) that the plastic formative principle of life (*anima, psyche*) is continually gathering and casting off the matter it needs for a body wherever it may be. The continuance of the vital principle constitutes identity, however the particles of matter may change, as in a flowing stream. In the case of Christ and those alive at his coming, the body then present supplies the material; in the case of the dead, the *anima* or *psyche* gathers in matter as it needs and makes the psychical body. The fundamental "form" or principle of bodily organism, which here appropriates earthly materials, shall in the resurrection appropriate higher materials. (8) That identity is in the spirit (*vous*), the rational, immortal principle which shows itself in the body which it occupies and stamps with its own personality. Identity in an inorganic body—e. g. a stone—is in its substance and form; in an organic body, in the whole organism; in a person it rests in the consciousness.

The resurrection body is (1) spiritual (*soma pneumatikon*), as opposed to the "natural" (*soma psychikon*); (2) like Christ's body; (3) glorious, powerful, incorruptible, immortal.

The doctrine, held by some, of two resurrections at different times—one of the righteous, to which the New Testament specially refers, and the other of the wicked—rests on (1) the declaration, Rev. xx. 5, 6; (2) the use of the phrase "resurrection from the dead," used fifty times, and always referring to the good; the phrase "of the dead," referring to the bad; (3) on the New Testament distinctions concerning the resurrection of the just and unjust, the resurrection to life or condemnation; (4) the longing of the apostle to attain the first; and (5) on the order given, 1 Cor. xv. 23.

ISAAC RILEY. Revised by F. H. FOSTER.

**Resurrection Plant:** a popular name of several plants which, after drying, on the application of moisture expand again. One of these is the Rose of Jericho (see JERICHO, ROSE OF) of the east Mediterranean region. Another common one is *Selaginella lepidophylla*, a Lycopod of the family *Selaginellaceae*, a native of Mexico and Central America. It is a vivid green, rosulate, branching plant, covering a space on the ground from 5 to 8 inches in diameter. When dry it rolls up into a dull-grayish ball, but upon the return of moisture it expands again into a beautiful green rosette. These plants are imported into the U. S. in considerable numbers, and sold as curiosities. CHARLES E. BESSEY.

**Resuscitation, or Artificial Respiration** [*resuscitation* is from Lat. *resuscita'tio*, deriv. of *resuscita're*, stir, rouse up again; *re-*, again + *subs*, from under, up + *cita're*, urge, excite, rouse]: motion of the ribs and exchange of air produced by external instead of internal and vital force. The natural exchange of air in respiration is effected by a mechanical process; and when the muscles which conduct it are deprived of their nervous stimulus by poisoning of the nerve-centers, that mechanical process can be kept going or be recommenced by mechanical means, and thus life be rekindled from apparent death. By compression of the ribs the chest-cavities are diminished, and a proportionate quantity of foul air is forced out by the mouth. On relinquishing that compression, the ribs by their own elasticity bound back to their former position, the chest-cavities are enlarged, and the air (if that be the surrounding medium) is sucked in to prevent a vacuum. Whatever the method, it is upon this principle alone, with the observance of proper alternation and rhythm, that such an exchange of air can be effected as to be a substitute for natural breathing. Its use is in suspended animation from suffocation, as in drowning and hanging, also from vapor of chloroform or other noxious

gases, in which, death occurring from exclusion of air, a supply of air to the lungs is the one remedy.

The following is known as the "direct method" for artificial respiration:

**Rule 1. To drain off Water from Chest and Stomach (in cases of Drowning).**—Instantly strip the patient to the waist. Place him face downward, the pit of the stomach being raised above the level of the mouth by a large, hard roll of clothing placed transversely beneath the body. Throw your weight forcibly two or three times, for a moment or two, upon the patient's back, over the roll of clothing, so as to press all fluids in the stomach out of the mouth.

**Rule 2. To perform Artificial Breathing.**—Quickly turn the patient upon his back, the roll of clothing being so placed beneath as to make the breast-bone the highest point of the body. Kneel beside or astride patient's hips. Grasp front part of the chest on either side of the pit of the stomach, resting your fingers along the spaces between the short ribs. Brace your elbows against your sides, and, steadily grasping and pressing forward and upward, throw your whole weight upon the chest, gradually increasing the pressure while you can count *one—two—three*. Then suddenly let go with a final push, which springs you back to your first position. Rest erect upon your knee while you can count *one—two*; then make pressure again as before, repeating the entire motions at first about four or five times a minute, gradually increasing to about ten or twelve times. Use the same regularity as in blowing bellows and as is seen in natural breathing, which you are imitating. If another person be present, let him with one hand, by means of a dry piece of linen, hold the tip of the tongue out of one corner of the mouth, and with the other hand grasp both wrists and pin them to the ground above the patient's head.

*Sylvester's method* is the most generally applicable. The body being placed upon the back, with the head slightly elevated, the flexed arms, grasped just above the elbows, are carried outward and upward from the chest almost perpendicularly, and retained in their position for about two seconds. They are then lowered and brought closely to the sides of the chest, against which they are firmly pressed for the same length of time, in order to expel the air as during the act of expiration. These alternate movements of elevation and depression are repeated from twelve to fourteen times a minute, and are performed with all possible gentleness. *Fell's method* of direct artificial respiration is applicable especially to opium-poisoning or other forms of narcosis. A tube is inserted into the larynx and trachea and warmed air forced in by a bellows. By this method persons apparently dead have been resuscitated. Mouth-to-mouth insufflation, in children especially, is easily practicable and very useful.

The length of time persons have been under water, or have remained apparently dead after leaving the water, and yet been resuscitated, is uncertain. The reported time is so remarkably long in some cases as to justify efforts for resuscitation for at least an hour, the patient having breathed within half an hour or perhaps an hour. In experiments by a committee of the Royal Medico-Chirurgical Society at London in 1862, dogs after complete submersion a minute and a half never recovered. After respiratory acts had ceased, the heart continued to act never more than four minutes. In the human subject these periods doubtless may be much longer, governed largely by the continuousness of submersion, the rate of the circulation at the last moment of consciousness, the temperature of the water, the amount of air which enters the lungs, etc. Revised by W. PEPPER.

**Retaining Wall:** a wall of stone built to sustain banks of earth in position. The lateral pressure of the earth depends upon its nature and upon the inclination of the wall (See EARTHWORK.) The thickness of the wall at the top will be usually 2 feet or more, and its thickness at the base is to be so determined that ample security against sliding, rotating, and crushing will be secured. The last of these is liable to occur only in very high walls, and the first can be always avoided by inclining the joints backward. The use of formulas for computing the thickness is hence mainly confined to the case of rotation for ordinary walls, and these are deduced so that under the most unfavorable circumstances the line of direction of the resultant of the earth pressure and the weight of the wall shall cut the base within its middle third. The cross-section of the wall is usually trapezoidal, but walls with curved front surfaces are occasionally built. If the back of a trapezoidal wall be ver-

**Retz, JEAN FRANÇOIS PAUL DE GONDI, Cardinal de:** b. at Montmirail-en-Brie, France, Oct., 1614. His family held high ecclesiastical dignities, and forced him against his will into the Church. He led, nevertheless, an irregular life, and devoted himself to the service of a restless political ambition. He was active in intrigues against Richelieu, after whose death he was, in 1643, appointed by the queen-regent coadjutor to his uncle, the Archbishop of Paris. The power he acquired as a pulpit orator he turned to political ends and tried to supplant Mazarin, taking advantage of the troubles of the Fronde. He acquired a cardinal's hat in 1651 by his intrigues, but was outgeneraled by Mazarin, arrested in 1652, and imprisoned, first at Vincennes, then at Nantes. While in prison he became Archbishop of Paris. He escaped, fled to Spain, and remained a fugitive there and in Italy and Holland till after Mazarin's death, when, in 1662, he made his peace with Louis XIV., exchanged his archbishopric for the abbacy of St. Denis, in Paris, and spent the rest of his life in dignified and sumptuous quiet, employed in some delicate diplomatic missions to Rome, in writing his *Mémoires*, and in paying his debts. D. in Paris, Aug. 24, 1679. His *Mémoires* cover the years 1643-55, are very frank, not always truthful, but brilliantly written. They were first published in 1717; the best recent edition is that in the series of *Grands Écrivains de la France* (first 9 vols., Paris, 1872-87). A. G. CANFIELD.

**Retzius, MAGNUS GUSTAF:** histologist; b. in Stockholm, Sweden, Oct. 27, 1842; widely known and quoted as an authority in anthropology. His work *Finska Kranier* (Finnish Skulls), published in 1878, is standard. In 1884 he compiled his German work *Das Gehörorgan der Wirbelthiere*. Since 1873 he has edited the volumes of *Ur vår tids Forskning*, and in 1881-82 he edited *Biologische Untersuchungen*, mainly written by himself. R. B. A.

**Reuchlin, roich-leen'** (Hellenized CAPNIO), JOHANN: classical and Hebrew scholar and humanist; b. at Pforzheim, Baden, Germany, Feb. 22, 1455. He was educated in the chapel of the Margrave of Baden, and followed in 1473 the young margrave to the University of Paris, where he began his studies in Greek. During two years' residence at Basel he wrote his Latin dictionary, *Vocabularius breviloquus sive Dictionarium, singulas Voces Latinas breviter explicans*; and during a second visit to France in 1478 he studied law at Orleans. In 1481 he lectured on jurisprudence and belles-lettres at the University of Tübingen, received the title of imperial counselor from the emperor, and lived subsequently for several years at the court of the elector palatine, Philip, at Heidelberg (1492-96). To this period belong his first studies of the Hebrew language and his comely, *Sergius, sive Capituli Caput*, whose satire against the clergy was heartily enjoyed. In 1498 he went to Rome, his patron, the elector palatine, having fallen under the papal ban, and he succeeded in procuring his absolution. After his return he was appointed president of the Suanian confederate tribunal, but he found time to continue his studies of Hebrew, the results of which were his *Rudimenta Hebraica* (1506), *De Arte Cabbalistica Libri III.*, and *De Accentibus et Orthographia Hebraeorum Libri III.* (1518). By these works he inaugurated the study of the Hebrew language in Western Europe. He exercised a similar stimulating influence by his handbooks, editions (e. g. Xenophon's *Agésilas*, *Hiero*, and the two speeches of Aeschines and Demosthenes on *The Crown*), and personal exertions in the study in Germany of Latin and Greek. The pronunciation of the Greek language known as Iotacism originated with him. He was too liberal to escape clashing against the prejudices of his age. A converted Jew, Johann Pfefferkorn, proposed in 1510 that all Hebrew books, with the exception of the Bible, should be burned. The Dominicans were in raptures over the proposition; the Inquisition immediately recognized it as a new weapon of persecution; the emperor acquiesced. Meanwhile Reuchlin remonstrated, the emperor withdrew his consent, and the Inquisition and the monks flew into a fury. Reuchlin published his *Speculum Oculare (Augenspiegel)* (1512) and *Defensio contra Calumniatores* (1513), while Ulrich von Hutten and Franz von Sickingen kept guard over his personal safety. In 1515 appeared the first part of the *Epistole Obscurorum Virorum*, most of which were written by a friend of Reuchlin, Crotus Rubianus, others by Ulrich von Hutten. The success of this famous satire was instantaneous, and did not a little in paving the way for the Reformation. With Luther himself Reuchlin felt a deep sympathy, but he declined an invitation to come

to Wittenberg, sending in his stead his nephew Melancthon, and maintained his connection with the Roman Catholic Church to the last. In 1520 he was appointed professor at Ingolstadt, but when the plague broke out in that city he determined to retire to Tübingen, but died at Liebenzell, June 30, 1522. His *Life* was written by Gehres (1815), Meyerhoff (1830), Geiger (1871), and Horawitz (1877). Geiger also edited his *Letters* (1876). Revised by A. GUDMAN.

**Réunion, rā'u'ni-ān'**, called **Bourbon** prior to 1848; also **Île Bonaparte**: an island and French colony in the Indian Ocean; belonging to the Mascarene group; about 100 miles S. W. of Mauritius; lat. 20° 51' 43" S., lon. 55° 30' 16" E. It is 38 miles long, 28 miles wide; area, 965 sq. miles. It is volcanic, and is traversed by a mountain-chain the direction of which is N. and S. This mountain-range, of which one peak rises 10,000 feet above the sea, divides the island into two portions, differing in climate and productions. The Piton de la Fournaise, 7,200 feet high, is an active volcano, the eruptions of which occur on an average at least twice a year. The soil in some parts is very fertile, and the scenery is generally extremely beautiful. The climate was formerly healthful, but Europeans now suffer much from typhoid fever and dysentery. The mean annual temperature is about 77° F. The island is often visited by terrific hurricanes, which demolish houses and tear up trees by the roots. The chief articles of export are sugar, coffee, and dyewoods. Maize, rice, and tobacco are also cultivated. Réunion has no good harbors, and the coast is consequently dangerous. Capital, St. Denis. The chief port is Pointe-de-Galets, from which extends a railway 78 miles long. This island was discovered in 1545 by the Portuguese, and was occupied by the French in 1649. Pop. (1889) 165,915, of whom 25,000 are Hindus. Revised by M. W. HARRINGTON.

**Reuss, rois:** the name of two small principalities of Germany belonging to an elder and younger line of the family of Reuss, and consisting of several separate territories situated between Prussia, Saxony, and Bavaria. The dominion of the elder line, Reuss-Greiz, has an area of 122 sq. miles. Pop. (1890) 62,754. Capital, Greiz. That of the younger line, Reuss-Schleiz Gera, has an area of 319 sq. miles. Pop. (1890) 119,811. Capital, Schleiz. The surface of both principalities is hilly, reaching over 2,000 feet high in the Thüringer Wald. More than a third is covered with forests, and there are extensive meadows on which cattle are fattened. Woolen, cotton, and silk goods are woven.

**Reuss:** a river of Switzerland. It rises in the canton of Uri, near St. Gothard, descends in its upper course 4,500 feet in a series of wild cataracts and magnificent cascades, enters the southern end of Lake Lucerne, issues from the northern end as a clear, deep-green, navigable stream, and joins the Aar in the canton of Aargau at Windisch after a course of about 100 miles.

**Reuss, ÉDOUARD GUILLAUME EUGÈNE, D. D.:** theologian; b. at Strassburg (then a part of France), July 18, 1804; educated at the seminary of his native city; studied theology at Göttingen under Eichhorn, Oriental philology at Halle under Gesenius, and pursued the latter branch at Paris under Silvestre de Sacy; taught biblical criticism and Oriental languages in the theological school of Strassburg 1829-34; became extraordinary professor there 1834, and ordinary (regular) professor 1836; retired on a pension 1888; declined a call to the University of Jena; published (in German) a *History of the Books of the New Testament* (Halle, 1842; 6th ed. Brunswick, 1887; Eng. trans. from 5th ed. 1874, by E. L. Houghton, 2 vols., Boston, 1884), and *Geschichte der heiligen Schriften Alten Testaments* (1881; 2d ed. 1890); *Histoire de la Théologie chrétienne au siècle apostolique* (2 vols., Strassburg, 1852; 3d ed. 1864; Eng. trans. Edinburgh, 1872); *Histoire du Canon des Saintes Écritures dans l'Église chrétienne* (1863; Eng. trans. Edinburgh, 1884); and prepared an annotated French translation of the entire Bible (19 vols., Paris, 1874-81), and the same in German (Brunswick, 1892, seq.). He edited for many years a German review which appears at Jena (*Beiträge*, etc.), contributed largely to Coan's *Revue de Théologie*, and was one of the most learned and liberal theologians of the French Protestant Church. With Baum and Cunitz, and after their death alone, he edited the monumental edition of Calvin's *Opera*, not yet finished (vol. I., 1894). D. in Strassburg, Apr. 15, 1891. Revised by S. M. JACKSON.

**Reuter, ro'iter, PAUL JULIUS, Baron:** promoter of the telegraphic system on the continent of Europe; b. at Cassel.

ties working upon natural data and that obtained in a supernatural mode as well as from a supernatural source. Again, in the knowledge of God, communicated by the objective activities of his Spirit upon the minds of special organs of revelation—supernaturally, thus, as to immediate origin as well as to ultimate source—some may emerge into consciousness along the lines of the ordinary action of the human faculties. Such knowledge would form a still higher intermediate class—between that obtained by the natural faculties working according to their native powers on supernatural data and that obtained in a purely supernatural mode, as well as from a supernatural source and by a supernatural agency. These modes of revelation are not to be overlooked. But neither is it to be overlooked that among the ways in which God has revealed himself is also this way—that he has spoken to man as Spirit to spirit, mouth to mouth, and has made himself and his gracious purposes known to him in an immediate and direct word of God, which is simply received and not in any sense attained by man. In these revelations we reach the culminating category of special revelation, in which its peculiar character is most clearly seen. And it is these direct revelations which modern thought finds most difficult to allow to be real, and which Christian apologists must especially vindicate.

*Theories of Revelation.*—In the state of the case which has just been pointed out, it is a matter of course that recent theories of revelation should very frequently leave no or but little place for the highest form of revelation, that by the direct word of God. The lowest class of theories represent revelation as taking place only through the purely natural activities of the human mind, and deny the reality of any special action of the Divine Spirit directly on the mind in the communication of revealed truth. Those who share this general position may differ very greatly in their presuppositions. They may, from a fundamentally deistic standpoint, jealously guard the processes of human thought from all intrusion on the part of God; or they may, from a fundamentally pantheistic standpoint, look upon all human thought as only the unfolding of the divine thought. They may differ also very greatly as to the nature and source of the objective data on which the mind is supposed to work in obtaining its knowledge of God. But they are at one in conceiving that which from the divine side is spoken of as revelation, as on the human side, simply the natural development of the moral and religious consciousness. The extreme deistic theory allows the possibility of no knowledge of God except what is obtained by the human mind working upon the data supplied by creation to the exclusion of providential government. Modern speculative theists correct the deistic conception by postulating an immanent divine activity, both in external providence and in mental action. The data on which the mind works are supplied, according to them, not only by creation, but also by God's moral government; and the theory grades upward in proportion as something like a special providence is admitted in the peculiar function ascribed to Israel in developing the idea of God, and the significance of Jesus Christ as the embodiment of the perfect relation between God and man is recognized. (Biedermann, *Christl. Dogmatik*, i., 264; Lipsius, *Dogmatik*, 41; Pfleiderer, *Religionsphilosophie*, iv., 46.) The school of Ritschl, though they speak of a "positive revelation" in Jesus Christ, make no real advance upon this. Denying not only all mystical connection of the soul with God, but also all rational knowledge of divine things, they confine the data of revelation to the historical manifestation of Christ, which makes an impression on the minds of men such as justifies us in speaking of him as revealing God to us. (Herrmann, *Der Begriff der Offenbarung*, and *Der Verkehr des Christen mit Gott*; Kaftan, *Das Wesen*, etc.)

We are on higher ground, however, although still moving in essentially the same circle of conceptions as to the nature of revelation, when we rise to the theory which identifies revelation strictly with the series of redemptive acts (Koehler, *Stud. und Kritiken*, 1852, p. 875). From this point of view, as truly as from that of the deist or speculative theist, revelation is confined to the purely external manifestation of God in a series of acts. It is differentiated from the conceptions of the deist and speculative theist only in the nature of the works of God, which are supposed to supply the data which are observed and worked into knowledge by the unaided activities of the human mind. In emphasizing here those acts of a special providence which constitute the redemptive activity of God, this theory for the first time lays the foundation for a distinction between general and

special revelation; and it grades upward in proportion as the truly miraculous character of God's redemptive work is recognized, and acts of a truly miraculous nature are included in it. And it rises above itself in proportion as, along with the supernatural character of the series of objective acts with which it formally identifies revelation, it recognizes an immediate action of God's Spirit on the mind of man, preparing, fitting, and enabling him to apprehend and interpret aright the revelation made objectively in the redemptive acts. J. Chr. K. Hofmann in his earlier work, *Prophecy and Fulfillment*, announces this theory in a lower form, but corrects it in his later *Schriftbeweis*. Richard Rothe (*Zur Dogmatik*, p. 54) is an outstanding example of one of its higher forms. To him revelation consists fundamentally in the "manifestation" of God in the series of redemptive acts, by which God enters into natural history by means of an unambiguously supernatural and peculiarly divine history, and which man is enabled to understand and rightly to interpret by virtue of an inward work of the Divine Spirit that Rothe calls "inspiration." But this internal action of the Spirit does not communicate new truth; it only enables the subject to combine the elements of knowledge naturally received into a new combination, from which springs an essentially new thought which he is clearly conscious that he did not produce. The theory propounded by Prof. A. B. Bruce in his well-known lectures on *The Chief End of Revelation* stands possibly one stage higher than Rothe's, to which it bears a very express relation. Dr. Bruce speaks with great circumspection. He represents revelation as consisting in the "self-manifestation of God in human history as the God of a gracious purpose—the manifestation being made not merely or chiefly by words, but very specially by deeds" (p. 155); while he looks upon "inspiration" as "not enabling the prophets to originate a new idea of God," but "rather as assisting them to read aright the divine name and nature." Dr. Bruce transcends the position of the class of theorists here under consideration in proportion as he magnifies the office of inner "inspiration," and, above all, in proportion to the extent of meaning which he attaches to the saving clause that revelation is *not merely* by word, but *also* by deed. The theory commended by the great name of Bishop B. F. Westcott (*The Gospel of Life*) is quite similar to Dr. Bruce's.

By these transitional theories we are already carried well into a second class of theories, which recognize that revelation is fundamentally the work of the Spirit of God in direct communication with the human mind. At its lowest level this conception need not rise above the pantheistic postulate of the unfolding of the life and thought of God within the world. The Divine Spirit stirs men's hearts, and feelings and ideas spring up, which are no less revelations of God than movements of the human soul. A higher level is attained when the action of God is conceived as working in the heart of man an inward certainty of divine life—as, for example, by Schultz (*Old Testament Theology*); revelation being confined as much as possible to the inner life of man apparently to avoid the recognition of objective miracle. A still higher level is reached where the action of the Spirit is thought of—after the fashion of Rothe, for example—as a necessary aid granted to certain men to enable them to apprehend and interpret aright the objective manifestation of God. The theory rises in character in proportion as the necessity of this action of the Spirit, its relative importance, and the nature of the effect produced by it are magnified. So long, however, as it conceives of this work of the Spirit as secondary, and ordinarily if not invariably successive to the series of redemptive acts of God, which are thought to constitute the real core of the revelation, it falls short of the biblical idea. According to the biblical representations, the fundamental element in revelation is not the objective process of redemptive acts, but the revealing operations of the Spirit of God, which run through the whole series of modes of communication proper to Spirit, culminating in communications by the objective word. The characteristic element in the Bible idea of revelation in its highest sense is that the organs of revelation are not creatively concerned in the revelations made through them, but occupy a receptive attitude. The contents of their messages are not something thought out, inferred, hoped, or feared by them, but something conveyed to them, often forced upon them by the irresistible might of the revealing Spirit. No conception can do justice to the Bible idea of revelation which neglects these facts. Nor is justice done even to the rational idea of revelation when they are neg-

a fourth, the introduction of monachism, etc. Such a diversity rises simply from the imagination having been set free and working without any fixed rule. It is, moreover, inadmissible that it should be necessary to possess the whole treasury of learning belonging to a professor of history in order to understand a book which God has given to his people for the purpose of edification. The modern rationalists have broken with this method of interpretation for many reasons, good and bad; first, no doubt, because it presupposes divine inspiration, but also because their whole system leads them to seek the key to the interpretation of a book in the circumstances under which it was written. Hence the interpretation of the beast as the Roman empire, and of the head wounded to death, but reappearing as Antichrist, as the Emperor Nero. Insurmountable difficulties are, however, involved in this method of explanation; and it seems very singular that a book so holily conceived and so severely planned should be a mere tissue of fancies and hallucinations.

There remains the method which recognizes in the Revelation a picture of the general progress of the Church, to whose understanding no other premises are necessary than such as may be drawn from the Scriptures themselves. There is still room for individual views. Thus Bossuet sees in the destruction of the beast the fall of the Roman empire; Hengstenberg considers the reign of a thousand years as the predominance of Christianity from Charlemagne to our days; John Nelson Darby, the principal founder of the Plymouth Brethren, holds that the whole history of the Church from the apostolic age up to that preceding the return of Christ is omitted in the picture, and must be placed in the interval between the third and fourth chapters, so that the whole vision (iv.-xix.) relates exclusively to the future, to that which precedes immediately the coming of the Lord. It is impossible to enter here into a discussion of these individual points of view, but it is hoped that the reader, following the outline which has been given, will find in the Revelation points sufficiently precise to indicate the course of the religious progress of humanity, and at the same time sufficiently elevated to enlighten and fortify his heart under all the various events of his life. There is the same power in this vision as in that through which God revealed to Moses in six successive pictures the origin of the world. At every moment of a person's life he finds himself in contact with the religious bearing of this vision in Genesis. At every moment, too, but especially when he is under the cross, his soul gathers new life from the spirit of the apocalyptic expectations. It is solely for this purpose of edification, and not in order to satisfy our curiosity, that God has permitted us to see, on the one hand, through the eyes of Moses, the stream of the times issuing forth from eternity, and on the other, through the eyes of John, the times returning to the sea of eternity. Christ is coming (the Old Testament); Christ has come (the gospel); Christ shall come again (the Revelation)—such is the sum of the history of mankind.

One of the chief problems of the book relates to Antichrist. There are two leading opinions respecting his person. Some consider him merely as a poetical personification of a principle, of the spirit of rebellion against God and Christ, which shall go on increasing till the final triumph of the gospel. Others recognize in him a real man, who shall concentrate in his own person to the utmost extent the spirit of apostasy. The second chapter of the Second Epistle to the Thessalonians, in which his apparition is described, speaks decidedly in favor of the second explanation. Antichrist is here designated as the man of sin, who shall place himself as a god in the temple of God; he is called the wicked man whom the Lord shall destroy by the breath of his mouth. His theological system may be summed up in the three following theses: (1) There is no personal God without and above the universe; (2) man is himself his own god—he is the god of this world; (3) "I am the true representative of humanity; by worshipping me mankind worships itself." Even from this general point of view there still remain certain differences of opinion. According to some this person has already appeared on the stage; he is the pope. It is evident, however, that the pope has never actually substituted himself for God or Christ; on the contrary, he rests his authority on that of Christ and God. The pope may be said to be on the way which ends with the arrival of Antichrist, but he is not yet Antichrist himself. Others hold that the Antichrist announced in the Revelation is only an empty supposition,

which has never been revealed. The author of the prophecy, they say, thought of the Emperor Nero, that matchless monster, the first persecutor of the Church, whose death the world could not believe in, and whom the terrified Church feared to see return suddenly and assume the part of the man of sin and the universal suppressor. The number 666, which, according to xiii. 18, is the number of the beast, was explained in accordance with this view. The letters of the two words KAISAR NERON, when taken as ciphers and counted in Hebrew, give indeed the sum of 666. This fear was never realized, however, and thus the Revelation became an unfulfilled prophecy on this capital point. It is difficult to understand how under such circumstances the book can have survived in spite of the discredit which fell on it immediately after its appearance, and how the author, if he was a serious man, could suffer it to circulate without retraction. It must also be noticed that in order to obtain the sum of 666 from this name it must be written *Kesar*, and not *Kaisar*, which is against custom and orthographical rules. Finally, it would be somewhat strange if the name which was to be figured out of the number had been put down in Hebrew, while all the rest of the work is in Greek. In speaking of the man of sin, St. Paul, far from identifying this person with the Roman emperor, hints that, on the contrary, it was the imperial power which prevented Antichrist from appearing. "Ye know," he says (2 Thess. ii. 6), "what withholdeth that he might be revealed in his time." The apostle considers Antichrist as the realization of the false Messiah, the terrestrial king, the new Solomon, whom the carnal Israel expects. What was it that prevented the Jews of that time from putting forth this false Messiah, the object of their hearts' longings? It was the Roman legions, which on the mere nod of the emperor would have invaded the Holy Land and put down any attempt at insurrection. It is the powers instituted by and inherited from the Roman empire which up to this very day have prevented Antichrist, the false Messiah of the Jews, from appearing; but he will not fail to come forth as soon as these powers fall; the Jewish people will then have acquired that preponderance in all civilized states which is necessary before it can give its insatiable ambition the reins. With respect to the number 666 numerous solutions of this enigma have been given, but none which is thoroughly satisfactory. A peculiar fact has lately attracted attention. The Greeks do not designate numbers by particular signs called ciphers, but by the letters of the alphabet, to which a numerical value is assigned. Thus 600 is expressed by the letter X (*ch*), 60 by ξ (*xi*), and 6 by ς (*vi*). The name of Christ (*Christos*) is represented by the first and last letters, χς, and these two letters represent the two numbers 600 and 6. If between these two letters the letter ξ, which signifies 60, is introduced, the sum of 666 is obtained; and the three letters, χςξ, represent the abridged form of the name of Christ, but in such a manner that the first and third letters are separated by the ξ, the emblem of the serpent. Thus in Greek 666 is the emblem of the Messiah, of Satan, or of Antichrist. It may also be noticed that, according to the symbolism of numbers employed in the Revelation, the number 7 always expresses the divine plenitude, and that God, as the Father, the Son, and the Holy Spirit, must consequently be represented in ciphers by 777. Thus the number 666 would signify the creature's highest though still impotent effort at attaining divine glory and power, and the representation would comprise the three persons which form the diabolical trinity—namely, Satan, or the dragon, the beast, or Antichrist, and the second beast, or the false prophet. Satan can not become God, nor can Antichrist attain the dignity of the Son-Messiah, nor the false prophet equal the Holy Ghost. Nevertheless it is no doubt wise to apply to our age that which in the second century the pious Irenæus said to his: "If the author of the prophecy would have made the name known to this time, he would have designated it more plainly." Irenæus mentions several explanations propounded in his time, of which the least improbable is the word *Lateinos*—that is, Latin, Roman, the Roman emperor. The Greek letters of which this word is composed give, indeed, when added together as ciphers, the exact sum 666.

FRÉDÉRIC GODET.

The author calls himself "John" in i. 1, 4, 9, xiii. 8, and traditionally the Revelation has been assigned to the apostle John. Bishop Boyd Carpenter, in Elliott's *Commentary on Revelation*, thus sums up the case on the orthodox side: "The author represents himself as John in a way and at a

settled in 1829 in Paris, and devoted himself to literature, writing for many liberal journals; edited *Histoire scientifique et militaire de l'Expédition française en Égypte* (10 vols., 1830-36); published from 1836 to 1840, in the *Revue des Deux Mondes*, his *Études sur les Réformateurs, ou Socialistes modernes*, which in 1841 received the Montyon prize from the Academy and has since passed through several editions; published in 1843 *Jérôme Paturot à la Recherche d'une Position sociale*, his most popular work, which was followed in 1848 by *Jérôme Paturot à la Recherche de la meilleure des républiques* (1848). He became a member of the Academy in 1850, and continued to write romances, economical essays, political pamphlets, and literary and social criticisms. He was several times elected to the legislature, and after the *coup d'état* of 1851 was a member of the consultative commission. D. in Paris, Oct. 28, 1879.

**Reyer, rā'i-ā', Louis Étienne Ernest** (real name Rey): composer; b. at Marseilles, France, Dec. 1, 1823; began to study music there; when sixteen years of age went to Algiers, in the service of the Government. In 1848 he returned to France and continued to study in Paris. His first important composition was *Le Sélam*, an Oriental symphony with choruses, produced Apr. 5, 1850. Since then he has composed several operas with more or less success, prominent among which are *Sacountala* (1858); *La Statue* (1861); *Érostrate* (Baden, 1862; Paris, 1871); and *Sigurd* (Brussels, 1884). His latest work is *Salammbô* (1893). He is also an accomplished feuilletonist. He was decorated with the Legion of Honor in 1863 and raised to the rank of commander in 1891. He is a member of the Academy of Fine Arts.

D. E. HERVEY.

**Reykjavík, rík'yaa-vík**: the capital of Iceland, on the southwestern coast of the island, in lat. 64° 8' N., lon. 21° 5' W., at the head of Faxafljörð. It is the seat of the government, has a college with a library of 10,000 volumes, medical and divinity schools, an observatory and a museum, an important annual fair, and regular communication by steamships with Leith and Copenhagen. It was founded in 874. Pop. 1,400.

Revised by P. GROTH.

**Reynard the Fox**: a popular epic of European origin. Despite the efforts of Jacob Grimm (*Reinhart Fuchs*, 1834) to establish the existence of a native and purely popular Germanic beast-epos, of which *Reynard the Fox* formed the most conspicuous example, scholars now agree in regarding this beast-epos in general, and *Reynard* in particular, as an outgrowth of the old fables which were worked into this or that shape for prevailing satirical purposes. To be sure, we must admit a certain admixture of native material, and not ascribe every shred of these fables to the Orient. Yet in any case, whatever the material, monks, not popular fancy, were responsible for the development of the fables into later forms; they used the stories which came mainly from the East and drifted, by way of Greece and Italy, over Western Europe. A fable of Æsop got footing in German literature as early as the seventh century; another, the story of the sick lion and the fox, soon followed, and was treated as independent or purely local tradition. In the tenth century this fable was used as a convenient allegory for the fortunes of a monk; and a few years later, probably in Flanders, names were given to the principal beasts: Isengrim (iron-masked) to the wolf; Noble to the lion; and Reynard (originally the Germanic word meaning good or firm in counsel; the Low German form is Reineke or Reinke, while French Renard, as a generic name, has actually supplanted the Old French *goupil*, from Latin *vulpes*) to the fox. Bruin for bear is almost as common in English. The earlier literature had been in Latin and was didactic or satirical; but now, like the mediæval legend, this popular material found voice in the vernacular. It grew into a sort of epos; and indeed the Latin *Isengrimus* (about 1150) had already assumed epic proportions. The first German epos of Reynard was composed about 1180. French jongleurs worked the material into a sort of romance, the *Roman de Renart*, with many so-called branches. About the middle of the thirteenth century one of these French versions was used by a Fleming named Willem as basis for the admirable *Roman van den Vos Reinaerde*. This, again, was worked over and furnished with sundry additions by an unknown Fleming in the fourteenth century, under the name of *Reinart's Historie*; this, in turn, toward the close of the fifteenth century, was enlarged by explanations in prose; and finally it was translated into Low German as the famous *Reinke de Vos*, or *Reineke Vos*, appear-

ing about 1500. Enormously popular, these versions made their way into the various tongues of Europe. Caxton translated one of them and printed it, June, 1481, as *The History of Reynard the Fox*. (See Arber's reprint in the *English Scholar's Library*.) In modern times Goethe has told us this familiar story, the *Unheilige Wellbibel*, as he called it—in hexameters which hold a nice balance between epic and satire—*Reineke Fuchs*; an English translation was made by T. J. Arnold, and was published with Kaulbach's and Wolfe's illustrations.

It was Willem who gave Reynard his commanding place as hero of the little epic and representative of desperate craftiness. Willem, however, takes sides against his hero; while later versions make the fox a thoroughly triumphant rascal. The ethical problem involved is discussed half humorously, half seriously, by Froude in his *Short Studies on Great Subjects*. The student must be referred for details of bibliography to E. Martin, *Le Roman de Renart* (Strasbourg, 1882 ff.), and *Reinaert* (Paderborn, 1874); also to the preface of Arber's reprint of Caxton, and the introduction by W. J. Thoms to *The History of Reynard the Fox* (Percy Society, 1844).

FRANCIS B. GUMMERE.

**Reynolds, Henry Robert, D. D.**: clergyman and author; b. at Romsey, Hampshire, England, Feb. 26, 1825; educated at University College, London; became minister of a Congregational church at Halstead, Essex, England, in 1846; of East Parade Congregational church, Leeds, in 1849; president of Countess of Huntingdon's College, at Cheshunt, in 1860, and also Professor of Theology and Exegesis; was one of the editors of *The British Quarterly Review* 1866-74; author of *Beginnings of the Divine Life* (1858); *John the Baptist, a Contribution to Christian Evidences* (1874); *The Philosophy of Prayer, and other Essays* (1881); commentaries on Hosea and Amos, on the Gospel of John, *Athanasius, his Life and Work* (1889), and of important contributions to theological cyclopædias and reviews.

Revised by G. P. FISHER.

**Reynolds, Ignatius Aloysius, D. D.**: bishop; b. near Bardstown, Ky., Aug. 22, 1798; educated at St. Mary's College, Baltimore, Md.; ordained a Roman Catholic priest 1823; was successively vicar-general of Kentucky, rector of St. Joseph's College, and president of the Nazareth Female Institute of Kentucky, and was consecrated Bishop of Charleston, Mar. 19, 1844. D. at Charleston, Mar. 9, 1855.

**Reynolds, or Rainolds, John, D. D.**: clergyman and author; b. at Pinhoe, Devonshire, England, in 1549; studied at Merton College, Oxford, 1562; became fellow of Corpus Christi 1566; lectured on Aristotle; was appointed reader of the theological lecture founded by Sir Francis Walsingham 1586; was dean of Lincoln 1593; refused a bishopric in order to accept the presidency of Corpus Christi College 1598; was eminently distinguished as a Hebraist, regarded as the leader of the Puritan party, and was said by Hallam to have been "the most eminently learned man of Queen Elizabeth's reign"; took a prominent part in the Hampton Court conferences of 1603, where he maintained the necessity of a new version of the Bible; executed a small portion of King James's version, and revised much more in the weekly meetings of the translators held at his chambers. D. at Oxford, May 21, 1607. His works consist chiefly of separate sermons, controversial treatises against the Church of Rome, academical discourses, and some writings upon biblical criticism, the most elaborate being one successfully directed against the admission of the Apocrypha as part of the Old Testament canon—*Censura Librorum Apocryphorum Veteris Testamenti*, posthumously printed (Oppenheim, 2 vols., 1611).—His brother, WILLIAM REYNOLDS, b. at Pinhoe about 1540, was educated at Oxford; became a Roman Catholic; was Professor of Divinity and Hebrew at Douay and Rheims; took an important part in the translation of the Rheims Testament; translated from English into Latin all the works of Thomas Harding; wrote several theological and controversial treatises, and became chaplain to the Beguin nunnery at Antwerp, where he died Aug. 24, 1594.

**Reynolds, John Fulton**: soldier; b. at Lancaster, Pa., Sept. 20, 1820; graduated at the U. S. Military Academy, and appointed brevet second lieutenant of artillery, July, 1841; captain 1855; served in the war with Mexico, winning the brevets of captain and major; in Sept., 1860, was selected as commandant of cadets at West Point; in May, 1861, was transferred to the infantry with rank of lieutenant-colonel (colonel, June, 1863), and in August appointed brigadier-general of volunteers, and assigned to command of

Reviewed by James Morrison

**Rembrandt van Ryn**, a painter, b. at Plympton-Burk, England, July 15, 1720. He showed much artistic talent, drawing and at the age of eighteen was apprenticed to the study of Thomas Hudson, a portrait painter. Soon after that he began to paint portraits professionally, sometimes in Plymouth, Mass., now Hingham, and then in London, but in 1748 he moved to the invitation of the Academy to spend about a year and a half in Italy, to study the art of painting in the Mediterranean. This gave him an opportunity to study Italian painting and he remained some five years in Rome and other cities in Italy. He returned to London and was almost immediately elected a full member of the Academy. Although already very deaf, he continued to work with increasing diligence until his death, in 1792, at the age of seventy-two, and was everywhere a popular artist. He lived within the house in Leicester Square, London, where he lived and painted until his death. In 1768 the Royal Academy was founded, and Rembrandt was elected a member. He was elected again after his death, the academy continuing until 1790 his long term of membership, when in the academy has been generally discontinued. He took up the custom of delivering lectures on the study of the art of painting, a carefully prepared lecture on the anatomy of man having been connected with the art. His paintings and drawings are the well known *Discourses* of the artist *R. van R.*

He was married a second time, and was the central figure in the literary, scientific and political circles of the country. His personal friends were Edmund Burke, Dr. Johnson, and Oliver Goldsmith. It was in connection with the latter that Goldsmith wrote his famous letter to Richardson, a collection of passages from which are given numerous examples of phenomena were provided to him, and he constructed a machine large for the time, and which was intended as the result of an action by Goldsmith. It is in connection with this

[illegible]

At the Howard Gallery is a list of some sketches of important pictures and of those that exist of Lord Howard's. The list of Howard's pictures, from 1701 to 1744, includes all the pictures of Howard, the original brought by a Mr. Owen from Paris to his uncle, and sold and acquired by a Mr. Jones, perhaps a picture of *Memphis* of the *Monarchy* of *Philadelphia* and a second and similar group. The *Age of Innocence*, the *Temple of Minerva*, the *Alley of Hesperus*, *Howard's Victory*, being several still more striking and not unknown to the head of a daughter of Lord William Howard, *Howard's* a family portrait of Mrs. Tollemore. A large number of portraits are in the National Portrait Gallery; among them one of Edmund Burke and one of Sir William Chambers, two architects. In the Howard Avenue permanent exhibition are an admirable portrait of himself one of George III. and a second one of Sir William Chambers. In the South Kensington Museum, the Science Museum, Grosvenor House, the Duke of Westminster's private gallery, Grosvenor House, and several other private houses open to the public are perhaps thirty important works, so that Reynolds can be possibly well studied without leaving London. At the Imworth Gallery, the Edinburgh National Gallery, the City of University Gallery, and at the Brompton, St. Petersburg, are many other pictures.

Many of the jointings have been engraved, about twenty-five of them by Francis Bartolozzi in stipple, and many more in mezzotint by John Dixon, Richard Fisher, Valentine Green, John James, James McAlister, and J. Raphael Smith, besides many engravers who made two or three plates each. These engravings are among the finest ever made, and constitute by themselves an important department of art.

**Reynolds, William Morton, D. D.**, clergyman and educator, b. in Princeton, Pa., Mar. 4, 1812; graduated at Jefferson College, 1832; became a clergyman of the Lutheran Church; was professor in Pennsylvania College, 1836-'70; president of Capital University, Ohio, 1850-'55, and of Illinois State University 1857-'61; was ordained in the Protestant Episcopal Church, 1860. Author of *Discourses on the Swedish Churches*, of several occasional essays, addresses, and pamphlets, edited the *Lectures of Princeton Theology* (1840) and conducted *The Evangelical Magazine* (1840). *The Literary Record* (1845), was *The Evangelical Review* (1846-'62). Dr. Reynolds translated from the Swedish with introduction and notes *A History of New Sweden, or the Settlements on the River Delaware, by Isaac Alarik, Priest of the Swedish Church in America, and Rector of the Old Swedish Church, Waukegan, Indiana*, published by the Pennsylvania Historical Society. D. at Oak Park, Ill., Sept. 5, 1878. Revised by W. S. Priddy.

**Rezin** [from Heb. *Razan*, liter., press-; the eighth and last of a line of kings of Damascus beginning with Hazael, contemporary with David. He began to reign about 748 B.C. (2 Kings xvi). He fought against Jotham in conjunction with Pekah of Samaria (2 Kings xv. 37, xvi. 5, comp.). Against Jehu King Amaz turned Thelathphasar, who came and took Damascus and put Rezin to death (2 Ch. 28: 18). The Assyrian inscriptions show that Rezin, or *Rassan*, was paid tribute in 728, and that when Damascus was taken over of the inhabitants were carried into captivity.

Revised by S. M. JARVIS.  
**Roseville, Battle of:** another name for the Battle of  
 Horseshoe. See **UNIONVILLE.**

**Rhachiglossa** (Gr. *ῥαχη* spine + *glossa*, tongue): a group of barnacles having a flattened, flattened and flattened, on bracing the column, depressed, the horns, the horns, the horns, etc.

**Rhodomantis** (thus) Mr. G. P. Adams, son of Zoro for Rhodanus, and a brother of Mirus, King of Crater. He was a person

out of Crete by Minos and fled to Boeotia, where, after the death of Amphitryon, he married Alcmena. As a special favor Zeus translated him to the Elysian Fields, where later on he became a judge.  
J. R. S. S.

**Rhætia**: an ancient province of the Roman empire; bounded N. by Vindelicia, E. by Noricum, S. by Gallia Cisalpina, and W. by Helvetia. It corresponded to the modern Tyrol and the Swiss canton of Grisons. Its inhabitants, the Rhæti, who lived as shepherds, were said by Livy and Pliny to be of Etruscan descent, and were subdued by the Romans 15 B. C. During the last days of the Roman empire, when the barbarian hordes swarmed around its frontiers and devastated its provinces, Rhætia became nearly depopulated.

**Rhæto-Romance, or Rhæto-Romanic Dialects**: a group of Romance dialects on the border between German and Italian speech. The region in which they are spoken embraces most of the canton Graubünden (Grisons), including the Engadine, in Switzerland, two or three strips of territory in Tyrol, and the whole of Friuli in the corner of Italy N. E. of Venice and extending as far as the Isonzo. The Swiss part of the territory has a population of about 40,000, the Tyrolese about 11,000, and the Friulan about 464,000, making a total of about 515,000, according to Gartner in his grammar of these dialects (1883). The name Rhæto-Romance is given from the Roman province Rhætia (or Rætia); other names, not generally applied to all the dialects, are Romansch, Romaunsch, Rumonsch, etc. (from a Latin adverbial form *Romanice*), and Ladin (i. e. Latin). These dialects vary considerably in vocabulary, phonology, and inflections, and they have not many distinctive features common even to most of them, which at the same time distinguish them from the adjoining Lombard and Venetian dialects of Italy, nor is it possible to draw a sharp line of division from these latter. Some generally convenient tests are, for example, the words for head, brother, sister, son, daughter, sun, which in these dialects usually are descended from Latin (or Low Latin), *caput, frater, soror, filius, filia, solculus* (a diminutive of *sol*), while the Italian dialects here concerned have forms corresponding to the literary Italian *testa, fratello, sorella, figliuolo, figliuola, sole*. The treatment of Latin vowels after the accent is not dissimilar to that in French or Provençal; Latin initial *bl, pl, fl, cl, gl* are generally retained and not changed as in Italian; the treatment of original *ca* and *ga* shows a resemblance to that seen in French; Latin final *s* is retained in certain inflectional endings; the imperfect subjunctive is much used as a conditional also, and perhaps this use was formerly regular in regions where now another conditional form is found. There are interesting features of certain dialects, and not all those which may serve to distinguish Rhæto-Romance from Italian are here mentioned. In the phonology occur vowels like those written *u* and *eu* in French, also a vowel resembling the French so-called "mute *e*." Latin *au* is in some regions retained without change. Some dialects have also peculiar inflectional formations in verbs, for instance, the conditional. The future indicative in the western region is formed by using an auxiliary from Latin *venire*; in Tyrol and Friuli the common Romance formation is found. The descendant of the Latin perfect indicative is nearly or quite lost in the spoken dialects. Both German and Italian have exerted a considerable influence on these dialects.

In literary production only Graubünden and Friuli need be considered, and in Friuli, though documents are preserved from the fourteenth century on, yet the strong Venetian influence has prevented the development of an independent literature, and the productions are comparatively unimportant, serving for temporary amusement only—as comedies, or otherwise having little value, as newspapers. (See the *Archivio glottologico italiano*, iv., 185 ff.) In Graubünden, however, in the dialects along the Rhine (Oberländisch, including Obwaldisch, or Surselvisch, and Nidwaldisch) and in the Engadine (Upper and Lower are here to be distinguished) a stronger literary movement has produced more ambitious works, the main cause being the religious feeling due to the Reformation. Noteworthy especially are Bifrun's translation of the New Testament (1560) in the Upper Engadine, Chiampel's translation of the Psalms (1562) in the Lower Engadine, Bonifaci's *Catechismus* (a translation from German, 1601) in an Oberland dialect, L. Gabriel, *Ilg Nief Testament* (The New Testament, 1648), also some epic or historical verse, as *Tobia* (probably of the sixteenth century; see *Romanische Studien*, i., 336 ff.), Travers's *Chan-*

*zun dalla guerra dalg Chiasé d' Misch* (sometimes referred to as the *Müsserkrieg*, sixteenth century), and Gioerin Wietzel's poem, commonly referred to as the *Vellinerkrieg* (seventeenth century). There are some dramatic works belonging to the sixteenth and seventeenth centuries; those of the sixteenth at least are nearly if not quite all translations. To the sixteenth century belong a *Susanna, Joseph*, and some others (see *Zeitschrift für romanische Philologie*, ii., 515 ff., v., 461 ff., and *Romanische Studien*, vi., 239 ff.). To the seventeenth century belong some by Fadri Wietzel and others (see *Zeitschrift für romanische Philologie*, iv., 1 ff., *Le Sacrifice d'Abraham in Romania*, viii., 374 ff., *Susanna in Archivio glottologico italiano*, viii., 263 ff., *Revue des langues romanes*, xxvii., 121 ff., 162 ff.). Some early Oberland texts of interest under the general title *Quattro festi soprasilvani*, among them a *Barlaam and Josaphat* (*Vita de Soing Giosaphat*, etc.), were published by Decurtins in *Archivio glottologico italiano*, vii., 149 ff. The later literary production comprises (besides religious compositions) lyric poems, tales, translations, schoolbooks, etc. A fairly adequate view of the literature can be obtained from J. Ulrich's *Rhätoromanische Chrestomathie* (2 vols., with glossaries, 1882–83), supplemented by reference to texts and articles in the periodicals mentioned above, particularly the bibliographical lists of Böhmner entitled *Verzeichniss Rätoromanischer Literatur in Romanische Studien*, vi., 109–238. The *Catalogue of the Rhæto-Romanic Collection* presented to the Cornell University Library by Willard Fiske (1894) contains some other titles; see also the bibliographies in the *Zeitschr. für roman. Philol.* For the grammatical and historical study of the dialects, see especially Ascoli, *Saggi ladini in Archivio glottologico italiano*, i.; Gartner, *Rätoromanische Grammatik* (1883); id., in Gröber's *Grundriss der romanischen Philologie*, i., 461 ff. (1888), etc. See also ROMANCE LANGUAGES. E. S. SHELDON.

**Rhamnus**: See BUCKTHORN.

**Rhamphastidae** [Mod. Lat., named from *Rhamphastus*, the typical genus, from Gr. *ῥάμφος*, a crooked beak of birds]: a family of carinate birds, including the toucans. They are distinguished by their bills, which are long, high, and compressed, decurved at the tip, and with the lateral margins serrated; the nostrils are inconspicuous, superior, and at the base of the upper mandible; no bristles are developed; the wings are rather short and rounded; the tail is moderate and more or less convex; the tarsi are rather robust and covered with broad scales; the toes in pairs, two being directed forward and two backward; the inner toes anteriorly and posteriorly, shorter than the outer; the claws strong and curved. They are somewhat related to the cuckoos. The species are peculiar to America, especially the tropical regions; a few, however, extend northward into Mexico, but none is found within the limits of the U. S. They are generally combined under two genera—*Rhamphastus*, in which the nostrils are concealed, including seventeen species; and *Pteroglossus*, with the nostrils exposed, comprising forty-five species. They frequent lofty trees, feeding upon various fruits, especially the banana, but also live partly upon insects, and even reptiles, as well as young birds and eggs. The female makes her nest in holes in the trunks of trees, and generally deposits therein two eggs. See ARACARI.

Revised by F. A. LUCAS.

**Rhaphides, or Raphides** [Mod. Lat., from Gr. *ῥαπίς*, plur. *ῥαπίδες*, needle]: the crystals, often needle-shaped, of salts found within certain plant-cells. The oxalates, carbonates, and sulphates, and other salts of lime are those most commonly found. See HISTOLOGY, VEGETABLE.

**Rhapsodists** [from Gr. *ῥαψῳδός*, a rhapsodist; *ῥάπτω*, *ῥάψω*, sew, stitch, patch together + *ὄδῃ*, song]: a class of wandering minstrels in ancient Greece whose occupation was the recital of the Homeric and other poetry. After these poems were reduced to writing these rhapsodists ceased to be the honored singers of the early days of Greece.

The ariel toucan.

with the practice of the best writers and speakers. The precepts of rhetoric are not the arbitrary enactment of any man or any body of men, but simply deductions from the generalized experience and observation of generations of writers and speakers, with which all who propose to write or speak will do well to familiarize themselves.

Rhetoric recognizes three forms of discourse:

1. *Representative discourse*, in which the matter is presented for its own sake, without especial purpose or especial regard to form. Under this head are treated (1) things—description; (2) facts—narration; (3) truths—exposition. Clearness, accuracy, and completeness are the prime essentials of representative discourse.

2. *Poetry*, in which the matter and the purpose are subordinate to the form. Under poetry the following classification may be recognized: (1) The poetry of thought, or didactic poetry; (2) the poetry of feeling, or lyric poetry; (3) the poetry of action, or epic poetry, and dramatic poetry. The prime essentials to poetry are, first, a poetic thought; second, poetic diction—to characterize either of which would fall under the province of a special discussion.

3. *Oratory*, which proposes an end to be attained, to which the matter and form of discourse are merely ancillary. The ancients recognized three kinds of oratory—demonstrative, judicial, and deliberative. Blair proposes to recognize, instead, the eloquence of popular assemblies, the eloquence of the bar, and the eloquence of the pulpit. If a classification of oratory be attempted at all, it is better to make the basis of classification the purpose, rather than the occasion, of its exercise. Oratory is commonly regarded by rhetoricians as the normal type of discourse, embodying the fullest and loftiest ideal of the art. The orator generally seeks to bring something to pass; hence he appeals not to the intellect or to the feelings alone, but to the will. He must sway the whole man, or he must fail in the object he has in view. It is especially necessary for him to study adaptation, and his discourse, while not deficient in clearness and not offensive to the taste of his hearers, must excel in energy.

*Inventive rhetoric* has to do with the choice of themes, the accumulation of material, and the disposition of material. It was much more fully treated by the ancient rhetoricians than by those of the present day, many of whom ignore it altogether, regarding it as a mere department of ethical rhetoric, which does, in fact, greatly limit it.

*Ethical rhetoric* has especially reference to the purpose contemplated in discourse. This purpose may be either (1) *enlightenment*—i. e. to develop in the mind a new cognition; (2) *conviction*—i. e. to lead the mind to adopt a given opinion; (3) *excitation*—i. e. to move the feelings; or (4) *persuasion*—i. e. to determine the will to action. Excitation is not regarded as a distinct end of discourse by many rhetoricians, since, ordinarily, we seek to excite emotion only that through emotion we may influence the will. But the distinct recognition of excitation is essential to a complete analysis of ethical rhetoric; the methods of excitation may be separately studied; and excitation is sometimes (as in demonstrative oratory and in certain kinds of poetry and fiction) an end in itself. In all discourse—but especially in oratory—some one of the purposes mentioned above dominates. It is the function of rhetoric to show how discourse may, in matter and manner, be made subservient to that purpose.

*Aesthetic rhetoric* has reference to style, or the art of expressing clearly, energetically, and elegantly, the products of inventive rhetoric in adaptation to the ends of ethical rhetoric. Under the head of style the things of prime importance are (1) naturalness; (2) adaptation; (3) clearness; (4) energy; (5) elegance. These characteristics of style are discussed, with greater or less fullness, in all rhetorical treatises. Clearness, the most important attribute of a good style, is admirably treated in *How to Write Clearly*, by Prof. E. A. Abbott, of the City of London School.

*Figurative language* (or language which deviates from the plain and ordinary method of describing an object or stating a fact) may be included under the head of style, since it tends to promote clearness by associating the object or fact under discussion with more familiar objects or events; energy, by associating the object or fact under discussion with more exciting objects or facts; elegance, by associating the object or fact under discussion with more pleasing objects or facts. Figurative language embraces *figures of speech*, which consist in a mere modification of the form of expression, and *figures of thought*, which in-

volve an essential modification of the conception. These figures depend on three principles—(1) the principle of similarity; (2) the principle of dissimilarity; (3) the principle of association. Under the head of figures of speech come (1) alliteration, or the repetition of similar sounds at the beginning of successive words; e. g.

Apt alliteration's artful aid.—Churchill.

(2) Paronomasia, or the use of words in the same connection which are similar in sound, but dissimilar in sense; e. g.

Not on thy sole; but on thy soul, harsh Jew.—Shakespeare.

(3) Meiosis or litotes, in which an affirmative is represented by the negative of its contrary; e. g. "A citizen of *no mean city*" (Paul). (4) Pleonasm, which consists in the use of more words to express one's meaning than are strictly necessary, and which should be sharply discriminated from tautology, or the meaningless reiteration of thought. (5) Hyperbole, which consists in representing an object as larger than it really is, or stating a fact more strongly than is consistent with literal truth; e. g. "The English gain two hours a day by clipping their words" (Voltaire). (6) Climax, which consists in gradually rising, by more and more emphatic statements, to the fullest and most expressive utterance of thought; e. g. "Jesus of Nazareth pours forth a doctrine beautiful as light, sublime as heaven, and true as God" (Theodore Parker). Figures of speech comprise also ellipsis, asyndeton, polysyndeton, apostrophe, epizeuxis, epianalepsis, and interrogation, for the careful discrimination of which references must be made to special treatises.

Under the head of figures of thought that are *founded on the principle of similarity* there are—(1) The simile, which is an expressed comparison; e. g. "Like as a father pitieth his children, so the Lord pitieth them that fear him." (2) The metaphor, which is an implied comparison; e. g. "I am the Good Shepherd, and know my sheep." Similes are more conducive to clearness, metaphors to energy. Either may be made conducive to elegance. The metaphor may be tested by reducing it to an equation of ratios; e. g. "The ship plows the sea" equals "The ship is to the sea as the plow is to the land." Any metaphor which will not submit to this test is radically defective, introducing more than four terms or suggesting an unreal similarity. Under this head are recognized also (3) the allegory, which is an extended metaphor. Bunyan's *Pilgrim's Progress* is the best example. (4) The fable, which is essentially similar to the allegory, although briefer, more obviously didactic, and characterized by the free endowment of the brute (and even the inanimate) creation with the attributes of reason and speech. The fables of Aesop will at once suggest themselves. (5) The parable, which is a religious allegory. (6) Personification, which regards things inanimate as if they were animate; e. g. "The pyramids, dotting with age, have forgotten the names of their founders" (Fuller). Under this head, too, are included prosopopoeia, vision, and apostrophe.

Under the head of figures of thought that are *founded upon the principle of dissimilarity* there are contrast, antithesis, irony, which hardly require to be characterized or exemplified.

*Founded on the principle of association* is metonymy, or a transference of names (Gr. *metá* and *trópon*), involving the substitution of—(1) The cause for the effect and *vice versa*; e. g. "The Lord is my song. He is become my salvation." (2) The container for the thing contained; e. g. "He is a slave to the bottle." (3) The sign for the thing signified; e. g. "The scepter shall not depart from Judah." (4) The instrument for the agent; e. g. "The pen is mightier than the sword" (Bulwer). (5) The author for his works; e. g. "They have Moses and the prophets." (6) The place of manufacture for the thing made; e. g. "I prefer *Arminster* to Brussels."

Synecdoche must be classed under the head of similarity and dissimilarity combined; it is concerned with objects that are similar in kind, but dissimilar in extent or degree. By synecdoche one puts a part for the whole, as a sail for a ship, or a blade for a sword, etc. More specifically, synecdoche consists in the substitution of—(1) the concrete for the abstract; (2) the species for the genus; (3) the individual for the species; (4) the member for the individual; (5) the material for the thing made. Its employment is highly conducive to energy.

It falls within the province of rhetoric accurately to discriminate between the figures of speech which have been mentioned, and to give rules which shall facilitate their effective use.

from 5 to 28 feet; its elevation is 814 feet at Basel, 121 feet at Cologne. Its principal affluents are the Aar in Switzerland, the Neckar and Main in the Rheintal, and the Lahn and Moselle in the highlands of the lower Rhine.

Revised by M. W. HARRINGTON.

**Rhinebeck**: village; Rhinebeck town, Dutchess co., N. Y.; on the N. Y. Cent. and Hudson River (station name, Rhinecliff) and the Phila., Reading and New Eng. railways; 2 miles E. of the Hudson river, opposite Kingston, 15 miles N. of Poughkeepsie (for location, see map of New York, ref. 7-J). It is in an agricultural and stock-raising region, and is the chief shipping-point for the surrounding country. There are five churches, union free school with academic department, Starr Institute (founded in 1860), a national bank with capital of \$125,000, a savings-bank, and a weekly newspaper. A part of the town was laid out for settlers from the Rhine palatinate in 1714, a precinct was organized in 1737, a hamlet named Rhinebeck Flats was laid out in 1792, and the hamlet was incorporated as a village in 1834. Pop. (1880) 1,569; (1890) 1,649.

EDITOR OF "GAZETTE."

**Rhineland**: village; capital of Oneida co., Wis.; on the Wisconsin river, and the Chicago and N. W. and the Minn., St. P. and Sault Ste. Marie railways; 65 miles N. of Wausau, 255 miles N. by W. of Milwaukee (for location, see map of Wisconsin, ref. 3-D). It is in a lumbering region, has considerable milling and manufacturing interests, and contains a national bank with capital of \$50,000, a State bank with capital of \$50,000, and three weekly newspapers. Pop. (1890) 2,658.

**Rhinoceros**: See RHINOCEROTIDÆ.

**Rhinocerot'idæ** [Mod. Lat., named from *Rhino'ceros*, the principal genus, from Gr. *ῥινόκερος*, *rhinókeros*, rhinoceros; *ῥίς*, *ῥίς*, nose + *κέρας*, *keras*, horn]: a family of ungulate mammals embracing the various species combined under the popular name rhinoceros. They are distinguished by their massive form; short neck; long head: the presence in all the living forms of one or two horns on the middle of the nasal region, and the broad clavate feet, each of which has three toes. The teeth are M.  $\frac{3}{1}$ , P. M.  $\frac{4}{1}$ , C.  $\frac{3}{1}$ , I. variable—i. e. entirely wanting,  $\frac{1}{1}$ , or, in extinct forms,  $\frac{3}{1}$ ; the upper molars have a continuous outer wall, are without complete transverse crests; the lower molars (P. M. 2, M. 3) have two curved transverse crests. The family embraces few recent species, which have been variously grouped, but appear to represent only two genera—(1) *Rhinoceros*, including the Asiatic species, which are distinguished by the elongate and free intermaxillary bones, the long upper incisor teeth, the produced nasal bones, and the skin corrugated by well-marked folds. To this genus belongs the Indian rhinoceros

Indian rhinoceros.

(*R. unicornis*), the largest of the group, having a single horn and the folds of skin unusually well developed. It is now restricted to a part of Nepal, Bhutan, and Assam, in North-eastern India. The genus also includes the smallest species, the Sumatran rhinoceros (*R. sumatrensis*), which has two horns. It ranges from North-eastern India to the Malay Peninsula, Sumatra, and Borneo. (2) *Rhinaster*, embracing the African species, in which the intermaxillary bones are very small and free, the upper incisor teeth wanting, the nasal bones broad and rounded, and the skin smooth and not corrugated. There are but two species, each having

two horns. One of these, *R. simus*, improperly known as the white rhinoceros, is almost extinct, and the other, *R. bicornis*, is rapidly disappearing. In geological epochs other forms flourished, and one of these (*Calodonta*) survived long after the appearance of man on the globe; this form was distinguished by the union of the nasal and intermaxillary bones into one mass, and the ossification of the nasal septum. The existing species of the family are peculiar to Asia and Africa, but formerly the range of the family extended far northward into Europe and Siberia, and at a still earlier period the group was represented in North America.

Revised by F. A. LUCAS.

**Rhithon of Tarentum**: Greek poet; originator of the so-called *Hilarotragedia* (*ἱλαροτραγῳδία*), a serio-comic treatment of tragic themes, drawn from Greek mythology. See Völker, *Rhithonis fragmenta* (1887). B. L. G.

**Rhipæ'an Mountains** (in Gr. *ῥῑπαία ὄρη*): in Grecian mythology, mountains lying in the extreme north (or west). Servius derived the word from *ῥίπτεω*, because the north wind came from these mountains. Ancient geographers identified them now with the Alps and now with the western outliers of the Ural range. See HYPERBOREANS, HESPERIDES, and GRÆÆ. J. R. S. S.

**Rhipidoglossa** [Mod. Lat., from Gr. *ῥίπς*, *ripis*, fan + *γλῶσσα*, *glossa*, tongue]: a term sometimes employed for the abalones, key-hole limpets, and allied molluscs, usually called *Zygobranchia*. See GASTEROPODA.

**Rhizocarps**: See PLANTS, FOSSIL.

**Rhizoceph'ala**: See CIRRIPIEDIA.

**Rhizome**: See MORPHOLOGY, VEGETABLE.

**Rhizop'oda** [Gr. *ῥίζα*, a root + *πούς*, *podós*, foot]: a class of Protozoa (q. v.) characterized by the ability of the individuals to extend temporary protoplasmic processes of the body by means of which locomotion is effected and food obtained (*pseudopodia*). There is no cell-wall, but the animals may secrete internal or external calcareous or siliceous skeletons, or they may form protective cases of horny matter or by cementing together solid particles found in the water in which they dwell. The Rhizopods (which live in the ocean, in fresh water, and in moist earth) are usually divided into the *Lobosa*, *Reticularia* (*Foraminifera*), *Heliozoa*, and *Radiolaria*; while the *Monera* of Hæckel differ from the *Lobosa* only in the fact that in them a nucleus has not yet been discovered. Here, too, may possibly belong those forms classed sometimes as *Myxozoa* in the animal kingdom, sometimes as *Myxomycetes* or slime moulds in the vegetable kingdom. Reference should be made to the different divisions for descriptions of the forms included. J. S. KINGSLEY.

**Rhode Island**: one of the U. S. of North America (North Atlantic group); the last of the thirteen original States that ratified the Federal Constitution; the smallest State in the Union, and the thirty-fifth in population in 1890.

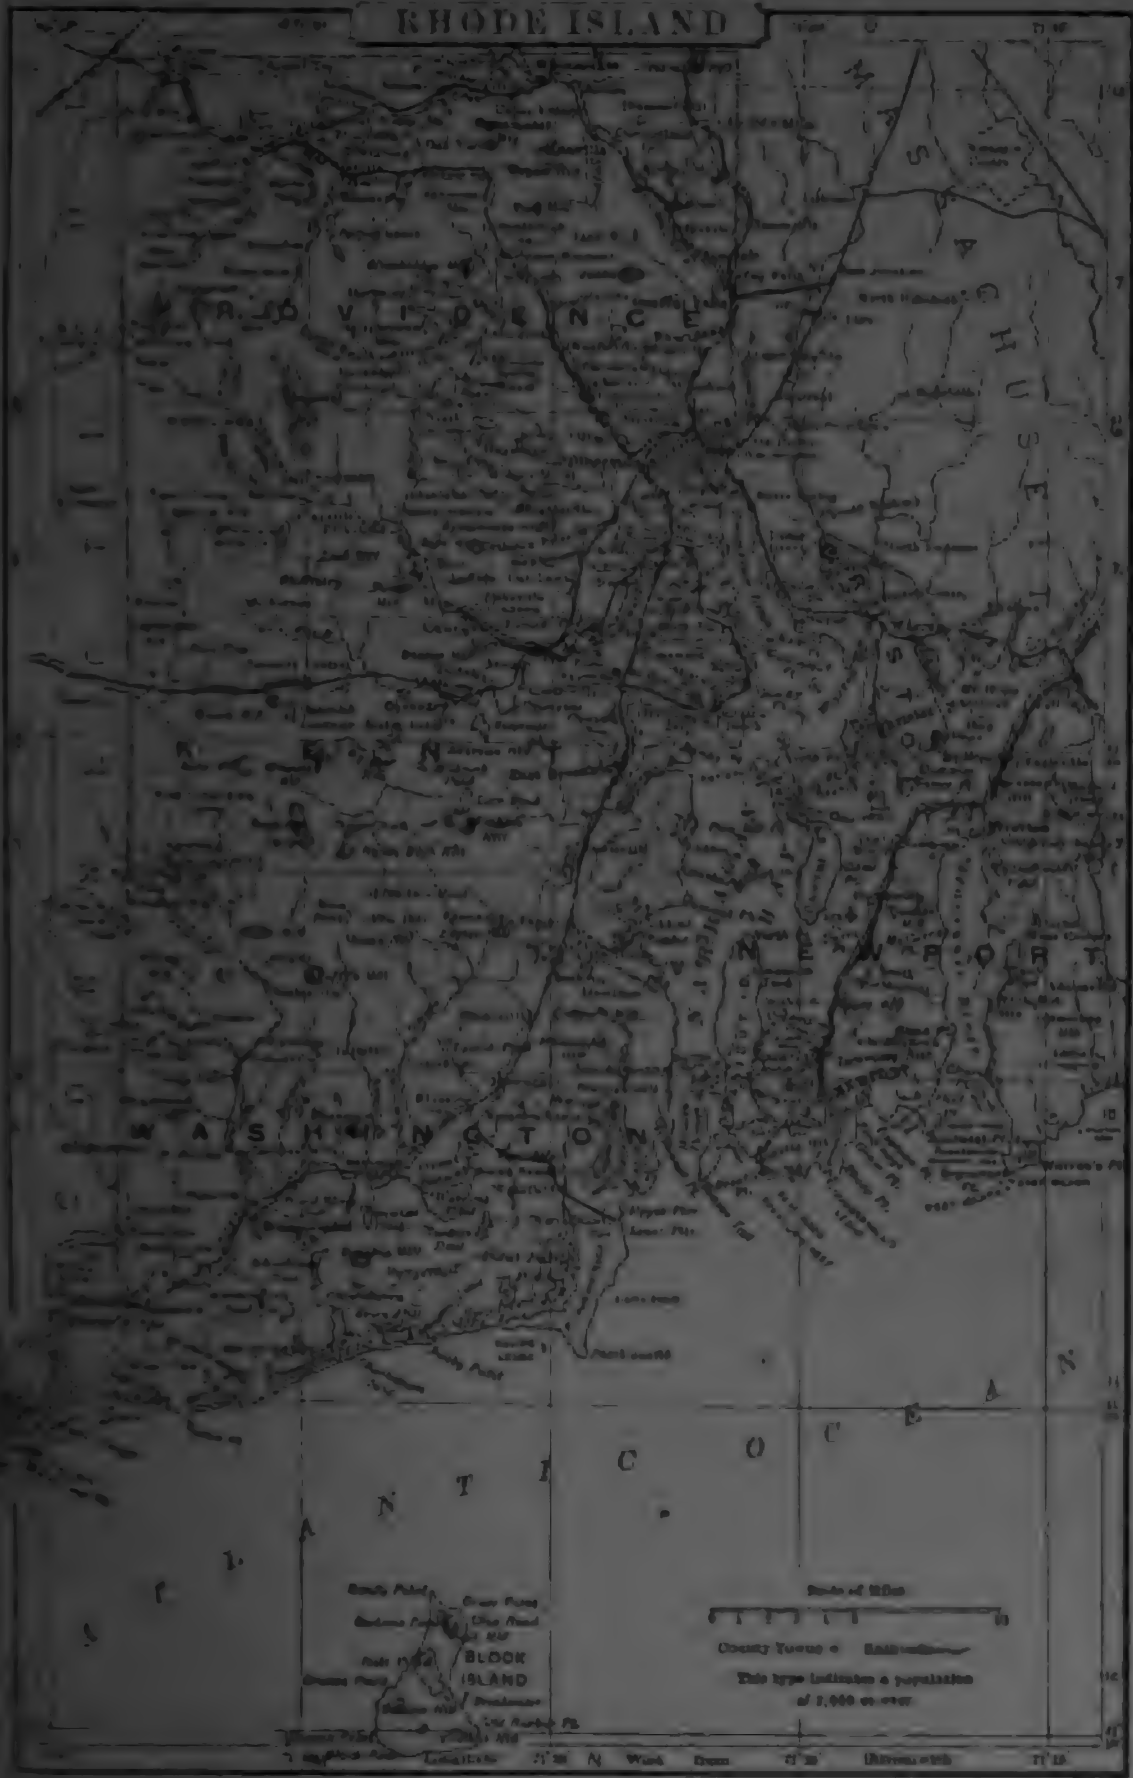

**Location and Area**.—It lies between lat. 41° 18' and 42° 3' N., and lon. 71° 8' and 71° 53' W.; is bounded on the N. and E. by Massachusetts, on the S. by the Atlantic Ocean, and on the W. by Connecticut; extreme length from N. to S. 48 miles; extreme width from E. to W. about 37 miles; area, 1,250 sq. miles (800,000 acres), of which 165 sq. miles is water surface.

**Physical Features**.—Narragansett Bay, extending inland about 30 miles, divides Rhode Island into two unequal parts. The surface of the State is for the most part hilly, though the hills never rise to any great height. Woonsocket Hill, the highest point of land, rising only 570 feet above the sea-level. Extensive salt-marshes border the ocean. In Narragansett Bay are many islands. Of these the most widely known is Rhode

Rhode Island seal.

THE NEW YORK  
PUBLIC LIBRARY

ASTOR, LENOX AND  
TILDEN FOUNDATIONS.

394.11 miles of railways and 107.66 miles of horse, electric, and cable tramways. Of the railways 226.70 miles were controlled by the New York, New Haven and Hartford Railroad. The total mileage of track was 501.78; passengers carried, 85,529,028; tons of merchandise carried, 14,536,469; and the net earnings were \$5,556,559. Various steamship lines connect Providence with the other towns upon the bay, and with New York, Philadelphia, Norfolk, and Baltimore.

**Churches.**—The census of 1890 gave the following statistics of the religious bodies having a membership of 500 and upward each in the State:

| DENOMINATIONS.                      | Organizations. | Churches and halls. | Members. | Value of church property. |
|-------------------------------------|----------------|---------------------|----------|---------------------------|
| Roman Catholic.....                 | 51             | 52                  | 96,755   | \$2,295,700               |
| Baptist, Regular.....               | 68             | 75                  | 12,065   | 1,151,960                 |
| Protestant Episcopal.....           | 50             | 63                  | 9,458    | 1,189,700                 |
| Congregational.....                 | 34             | 42                  | 7,192    | 905,800                   |

| Presb. in the U. S. of America..... | 4              | 4                   | 608      | 61,000                    |
| African Methodist Episcopal.....    | 4              | 4                   | 595      | 95,000                    |

**Schools.**—The principal educational institution of the State is BROWN UNIVERSITY (*q. v.*). Other superior institutions are the Rhode Island College of Agriculture and Mechanic Arts, with large agricultural experiment farm, in Kingston; the Rhode Island School of Design and the State Normal School, in Providence; 10 high schools and 5 academies. In the year ending Apr. 30, 1893, the public schools had 47,031 pupils, the parochial schools 10,532, and other private schools 2,201. The expenditures on account of the public schools aggregated \$1,185,058.

**Libraries.**—According to a U. S. Government report on public libraries of 1,000 volumes and upward each in 1891, Rhode Island had 73 libraries, which contained 481,729 bound volumes and 85,141 pamphlets. The libraries were classified as follows: General, 54; school, 5; college, 1; law, 1; medical, 1; public institution, 3; Y. M. C. A., 2; historical, 2; garrison, 2; society, 1; and unreported, 1. In the year ending June 30, 1893, 43 public libraries received aid from the State board of education.

**Charitable, Reformatory, and Penal Institutions.**—The charitable institutions comprise the Butler Asylum for the Insane, opened 1847; the Rhode Island Hospital, 1868; the State Home and School for Children, 1885; the Rhode Island Institute for the Deaf, 1893—all in Providence; and the State Soldiers' Home, 1891, in Bristol. The reformatory and penal institutions are located on the State farm of about 538 acres, in Cranston, and comprise the State Workhouse and House of Correction, the State Asylum for the Incurable Insane, the State Almshouse, the State Prison and Providence County Jail, the Sockanosset School for Boys, and the Oaklawn School for Girls, the two last being departments of the State Reform School.

**Political Organization.**—The Governor, general State officers, and members of the Legislature are elected annually. The Governor has no veto power. He exercises the pardoning power only "by and with the advice and consent of the Senate." The Lieutenant-Governor is a member-at-large of the State Senate, which numbers, besides thirty-six members, one from each of the thirty-two towns and four cities. The representation in the lower house is unequal. Its membership is limited to seventy-two. Each town and city must have one representative, but no town or city may have more than one-sixth of the whole number. Thus the city of Providence, with its population of almost 150,000 (1894), had but twelve representatives. This principle of representation accounts for the peculiar existence of the district of Narragansett. In 1888 this district was taken from South Kingstown and given all the powers of a town except representation in the General Assembly. Every male citizen of the age of twenty-one years, who has been a resident of the State two years and of the town or city six months, is entitled to vote in town and ward meetings and in the election of all civil officers, if registered on the last day of the preceding December. No person may vote in the election of city councils, or on any proposition involving the expenditure of money, unless he has paid a tax in the

year preceding on property valued at least at \$134. Every male citizen of the age of twenty-one, who has been a resident of the State one year and of the town or city six months, may vote on all questions and in all elections if he possesses in his own right real estate valued at \$134. Until 1894 a majority of votes was necessary to an election by the people, but in that year a plurality amendment was adopted.

**History.**—The founder of the colony was ROGER WILLIAMS (*q. v.*). In the winter of 1635-36 he was ordered to leave the colony of Massachusetts Bay within six weeks, under penalty of being sent back to England. He fled to the Narragansett country, and in 1636 settled near the mouth of the "Moosehaussick" river and gave his place of abode the name Providence, "because of God's merciful providence to him in his distress." The first written compact that has come down to us from the settlers of Providence sets forth the ideas which ever after governed the colony. In it the subscribers promise to subject themselves "in active or passive obedience to all such orders or agreements as shall be made for the public good . . . only in civil things." The utmost liberty was allowed in matters of religion. It was by request of the colonists that the patent obtained by Williams limited the authority to be exercised under it to civil matters. The colony originally consisted of four towns—Providence (1636), Portsmouth (1638), Newport (1639), and Warwick (1642). The executive heads of Portsmouth and Newport were called judges until 1640, when on the union of the towns the executive was called governor. Providence and Warwick had no executive head until 1647, when the four towns were united under a patent granted by Parliament in 1643. This was too feeble an instrument to answer the purposes of a charter. It produced a confederacy, not a union, and allowed the magistrates of the various towns to usurp dictatorial powers. In 1651 the two island towns separated from those on the mainland, and in 1654 they were reunited. In 1663 a charter was obtained from Charles II. This instrument was remarkably liberal. In its provision that no person should be "in anywise molested, punished, disquieted, or called in question for any differences in opinion that do not actually disturb the civil peace," it used almost the exact words of Charles's famous Declaration from Breda, which in 1660 had done so much to secure to him the throne of England. Under this charter the colony and State of Rhode Island and Providence Plantations were governed for 179 years. Rhode Island opposed the policy of the other colonies which led to King Philip's war, and yet suffered most severely from that war. King Philip was killed in what is now the town of Bristol. In the Narragansett country, in 1675, was fought the "great swamp fight," when more than a thousand Indians lost their lives. In 1686-87 Sir Edmund Andros suspended the charter, though he was not able to get possession of the document. On his deposition in 1690 the government was reorganized under it. Early in the nineteenth century it was seen that the charter had become too antiquated for the needs of the State, and repeated efforts were made to replace it with a constitution; but the General Assembly was supreme. It was dominated by the county-towns, which did not propose to surrender their power to the large seaport settlements. In 1841 a people's convention, not ordered by the General Assembly, met and framed a constitution. This illegal action precipitated a crisis. (See DORR REBELLION.) A new convention was soon called. The present constitution was prepared in Nov., 1842, ratified by the people, and put in operation 1843. The defect of the charter was its provision for a limited suffrage. In 1840, out of a population of 108,830, about 9,500 men composed the electorate. Not until 1888 were the present suffrage laws adopted.

With its privateers Rhode Island took a conspicuous part in all the wars waged upon the ocean in which Great Britain was engaged. When the news of the declaration of the war with Spain reached the colony in 1740 six vessels of war were at once placed in commission. In 1756 there were upon the ocean fifty Rhode Island privateers manned by 1,500 sailors. Privateering was ever a favorite pursuit, and in the Revolutionary war great wealth came into the colony from this source. In the war of 1812 the privateer Yank of Bristol took more prizes than any other privateer hailed from the U. S., and sent into Bristol more than \$1,000,000 as the profit from her six cruises. Commodore Oliver Hazard Perry, of Rhode Island, and his sailors made the naval renown of the State immortal in the battle of Lake Erie.

The colony first suggested to Congress the establishment of a navy. This was natural, as naval hostilities began in Rhode Island. In June, 1772, his Majesty's armed schooner

**Rhododen'dron** [Mod. Lat., from Gr. *ῥοδόδενδρον*, oleander; *ῥόδον*, rose + *δένδρον*, tree]: a large genus of plants of the heath family (*Ericaceae*), comprising trees, shrubs, and rootlet-climbing epiphytes, with entire, alternate evergreen, or rarely deciduous leaves, and showy flowers in terminal clusters; these with funnel-form five-lobed corollas and usually ten declining stamens. Passing S. of the equator only into Java and the neighboring islands, the rhododendron is found throughout the mountainous districts of the northern hemisphere. The greatest number of species occurs in the high mountain regions extending from Java and Borneo on the S. to Yun-nan and the Sikkim Himalaya in the N. Several are found in China and Japan, two reach Kamtschatka, and one Alaska. The arctic *R. lapponicum* of Lapland and Greenland occurs in the alpine region of the White Mountains of New Hampshire. The only two other European species are *R. ferrugineum* and *R. hirsutum*, the *Alpenrose* of the Swiss Alps. The species peculiar to North America are, on the Atlantic side, *R. maximum*, which occurs sparingly as far N. as Canada, and abundantly throughout the whole length of the Alleghany Mountains; *R. catawbiense*, a lower and earlier-flowered species on the higher mountains from Virginia southward; and *R. punctatum*, a graceful but less showy species of the middle country of the Southern States E. of the mountains. In the higher Northern Rocky Mountains there is a peculiar deciduous-leaved species, *R. albiflorum*; in Oregon, *R. macrophyllum*, apparently near *R. maximum*; in California, *R. californicum*, nearer *R. catawbiense*, but taller, and with more showy blossoms. The contrast in the size attained by the different species of this genus is as remarkable as its geographical range is extensive. The arctic *R. lapponicum* is but a few inches high, while *R. rollissonii* of Ceylon attains a height of 30 feet, with a stem over a foot in diameter. The useful properties of this genus are few and unimportant; the Siberian *R. chrysanthum*, however, supplies a narcotic sometimes used medicinally. Horticulturally, rhododendrons play a more important part. Several of the South Asiatic species are conspicuous inhabitants of conservatories, the best suited for such cultivation being *R. arboreum*, *R. dalhousiae*, *R. argenteum*, *R. hodgsoni*, *R. javanicum*, and *R. jasminiflorum*. Of hardy species, the most so in the northern parts of the U. S. is the Siberian *R. dauricum*, with small deciduous leaves and rose-colored flowers, appearing very early in the spring; but to the patient skill of the hybridizer we owe a race of hardy rhododendrons with showy flowers and foliage, and of greater horticultural value than any of the original types. These hybrids, the result of crossing the Alleghany *R. catawbiense* with the Eastern *R. ponticum* or with the Indian *R. arboreum*, are deservedly more generally planted than any other rhododendrons. Loving moisture and unable to withstand the severe summer droughts so common in many parts of the U. S., and not thriving in soils strongly impregnated with lime, the rhododendron as a garden-plant can be successfully cultivated only in the Atlantic States from Massachusetts to Virginia. To develop its greatest beauty the rhododendron should be planted in well-drained peat or in soil largely composed of decaying leaf-mould, and situations should be selected for it somewhat protected from the winter sun, the greatest enemy, with the summer droughts, to all evergreens in the U. S.

C. S. SARGENT.

**Rhodope**, rod'-pē (in Gr. *Ῥοδόπη*): a lofty mountain range in Thrace, noted in poetry as the scene of the revels of the Bacchantes, or female followers of Dionysus.

**Rhône**, rôn: a department of France, bordering E. on the Saône and Rhône, and comprising an area of 1,077 sq. miles. It is mountainous, covered with offshoots of the Cévennes, but with the exception of some fertile valleys the soil is mediocre. Copper, iron, and lead are found; excellent wine is produced, and the manufactures of silk and muslin are of great importance. Pop. (1891) 806,737.

**Rhône** (anc. *Rho'danus*): a river of France which rises in Switzerland, in the Alps, on the western side of the St. Gothard, flows through the Lake of Geneva, crosses the Jura Mountains, turns at Lyons, where it receives the Saône, to the S., and falls, 644 miles distant, into the Mediterranean, through two branches which form the island of Camargue. Its lower course is through swampy and unhealthy districts, but its whole middle course leads through beautiful and fertile regions producing some of the finest wines of France. It is everywhere very rapid, and the difficulty of navigation caused by the rapidity of the current

is increased by the suddenly shifting sandbanks and other obstructions, especially near the mouth. An extensive system of canals connects the river with the Mediterranean, and with the Seine, Loire, Garonne, and (by the Saône) the Rhine.

**Rhopaloc'era** [from Gr. *ῥοπαλον*, club + *κέρας*, horn]: the group of butterflies, the name being given in allusion to the club-shaped antennæ. See LEPIDOPTERA.

**Rhotacism**: the change of an *s* (*z*) to *r*; a technical term in historical grammar. The voiced form of *s*, i. e. *z*, shows a tendency in many different languages to become *r*. The sound of *r* as it appears, for instance, in English differs from *z* only in a slight retraction and elevation of the tip of the tongue. Rhotacism appears, e. g., in the Teutonic languages (except Gothic) where a medial *s* is preserved, but a medial *z* becomes *r*; thus Eng. *was*: *were*; *lose*: *forlorn* (Germ. *verloren*); also in Lat. between vowels; thus *generis* for *\*genesis*, cf. *genus*; *dirimo* for *\*dis-imo*, cf. *dissilio*; in certain Greek dialects as Laconian and Elean; cf. Laconian, *σῖρ* = *δῖς*, Elean, *ῖρ* = *ῖς*. BENJ. IDE WHEELER.

**Rhubarb** [viâ O. Fr. from Late Lat. *rheubar'barum*, from Gr. *ῥῆον ῥάββαρον*; *ῥῆον*, rhubarb, liter., the plant from the Rha or Volga (Gr. *Ῥᾱ*) + neut. of *ῥάββαρον*, foreign]: a plant of the genus *Rheum*, or its root employed in pharmacy. The botanical source of the drug is not definitely known, the *United States Pharmacopœia* defining it as the root of *Rheum officinale* and other undetermined species of *Rheum*, the *British* as the sliced and dried root of *Rheum palmatum*, *R. officinale*, and probably other species collected and preserved in China and Tibet. A specimen of *Rheum* was obtained through French missionaries in 1867 and sent to France, where it flowered at Montmorency in 1871. It seemed to correspond in all respects with the descriptions of the true rhubarb-plant, such as they are, and the root was apparently identical with the Asiatic rhubarb of commerce. This species has been described by Baillon under the name of *R. officinale*. Rhubarb has been known as a drug from a remote period. It was first brought to Europe by land from China to the Levant ports, whence the name Turkey rhubarb, or was shipped directly from China or by way of India, whence the variety called China, Canton, or East India rhubarb. Later, a direct trade between Russia and China was established, and under supervision of the Russian Government rhubarb was transported overland through Central Asia to Russia. For a long time, owing to the rigid inspection of Russian officials, this Russian or Turkey rhubarb was of unvarying good quality. Chinese rhubarb is now shipped direct from China. Chinese rhubarb is a rusty brown in color, and the texture is finely veined and marbled. Rhubarb has a peculiar smell, a disagreeable, bitter, and astringent taste, and a complex composition. A bit of the root if chewed feels gritty, from the presence of crystals of calcium oxalate. In small dose rhubarb behaves as a stomachic bitter, but in larger quantities is an active purge, producing liquid mucous evacuations. By reason of the tannin it contains it is also secondarily astringent. It is used in medicine as a stomachic and a laxative or purge, and is especially useful in summer diarrhœas from relaxation of the bowels or improper diet. The pharmaceutical preparations are very numerous. Among the most commonly used is the spiced or aromatic sirup, which is a tincture of rhubarb, cloves, cinnamon, and nutmeg diluted with six times its measure of sirup. The proportion of rhubarb is small, the preparation being intended as an aromatic astringent stomachic in the bowel complaints of children. *R. rhaponticum*, *R. undulatum*, and *R. palmatum*, or hybrids between them, are cultivated for their leaf-stalks, and to some extent for their roots. Revised by H. A. HARE.

**Rhumb** [from O. Fr. *rumb*, from Span. *rumbo*, appar. from Gr. *ῥόμβος*, magic wheel, whirling motion, deriv. of *ῥέμβειν*, turn]: in navigation, the track of a ship sailing on a certain course. A rhumb-line cuts all the meridians at the same angle, and when this angle is acute the rhumb is a species of spherical spiral, continually approaching the pole, but reaching it only after an infinite number of turns. The angle under which a rhumb-line cuts any meridian is called the angle of the rhumb, and the angle that it makes with the prime vertical at any point is called the complement of the rhumb. The projection of a rhumb on the plane of the equator is a logarithmic spiral.

**Rhus** [Mod. Lat., from Lat. *rhus* = Gr. *ῥόδς*, sumach]: a genus of shrubs or trees of the *Anacardiaceæ* or cashew

lent to the less acid granites. The groundmass may be lithoidal or porcelain-like, earthy, porous, or cavernous; or it may be dense glass or pumiceous glass. Its color varies from white and shades of gray to black. The lithoidal forms generally exhibit lighter colors, the glassy ones the darker colors, except in the case of pumice. The colors are white, blue-gray, greenish and purplish gray, pink to red, yellow, orange, brown, and black. The color may be uniform through the mass, or variegated in patches and streaks (*eulazitic*), or in bands and layers (*flow-structure*). The rock may be massive and compact, or split into layers or laminae parallel to planes of flow. It may be cracked into prisms or columns like those often seen in basalt. It may carry spheroidal stony bodies (*spherulites*) of various sizes, and hollow ones called *lithophyses*. These spheroidal bodies are special forms of crystallization of the magma.

Varieties of rhyolites based on textural features are *nevadite*, having relatively many phenocrysts; *liparite*, relatively few; lithoidal rhyolite; hyaline rhyolite, when glassy. The most glassy forms are *perlite*, pitchstone, *obsidian*, and *pumice*. When the groundmass is more crystalline, it grades into *porphyry*. With increasing calcium, magnesium, and iron, it grades through *dacite* into *andesite*. With increasing alkalis and decreasing silica, it grades into *quartz-trachyte* and *trachyte*.

The name *rhyolite* was introduced by von Richthofen in 1860. *Liparite* (Lipari islands) was introduced by J. Roth in 1861 for essentially the same rocks, and is in quite general use in Germany for the whole rock-group. Rhyolite forms lava-sheets of great size and extent throughout the western part of the U. S., where it was erupted during Tertiary times. Its most notable occurrence is in the Yellowstone National Park. It is well known in Wyoming, Idaho, Nevada, Utah, Colorado, New Mexico, and Arizona. It also occurs in Mexico, Iceland, Hungary, Lipari, and elsewhere. As a building-stone its delicate color adds greatly to its value. J. P. IODINOS.

**Rhys**, rees, JOHN: Celtic philologist; b. at Abercaero, Cardiganshire, Wales, June 21, 1840; educated at Jesus College, Oxford; studied at the Sorbonne and at Heidelberg and Leipzig 1868-71. Professor of Celtic in Oxford since 1877. He is the author of *Lectures on Welsh Philology* (1877; 2d. ed. 1879); *Celtic Britain* (1882; 2d ed. 1884); *Hibbert Lectures on Celtic Heathendom* (1888); *Studies in the Arthurian Legends* (1891); *Rhind Lectures on the Early Ethnology of the British Isles* (1890-91); joint editor of various Welsh texts. B. I. W.

**Rhythm** [viâ O. Fr. from Lat. *ryth'mus* = Gr. *ῥυθμός*, flow, measured motion, rhythm, deriv. of *ῥεῖν* (fut. *ῥήσεται*), flow]: the division of time into small approximately equal units by corresponding units of sound, or less sensibly by muscular movement or visible motion. Rhythm bears the same relation to time that symmetry bears to space. The arts of space and rest, or completion—statuary, architecture, and painting—are based on symmetry, while the arts of time and motion, or execution—dance, music, and poetry—are based on rhythm. Symmetry and rhythm are often confounded, as when it is stated that the windings of a valley form an instance of rhythm. One of the most common perversions of the term is its application to accentual as distinguished from quantitative verse. In English the accent, which is chiefly stress, marks the rhythmical unit, while in Latin and Greek, where the accent was chiefly pitch, the unit was marked, not by the accent, but by stress, usually that of long syllables as compared with short; but in both kinds of verse, if there is rhythm, the units, whether marked by accent or by stress, must be virtually equal. The fact that the quantity of syllables is more unsettled in English than in the ancient classics does not prevent us from making the feet equivalent.

Rhythm may be felt in movements of the body, as in marching or dancing (for even the deaf enjoy the dance), but it will be sufficient to treat of the rhythm whose substance (*ῥυθμικὸν* or *ῥυθμίζουσα*) is sound.

Just as a vast expanse of uniform color, however pleasant to the eye, does not show symmetry, so one continuous uniform sound, however agreeable to the ear, does not present rhythm. Any kind of sound may be made rhythmical, but here only music and speech need be recognized. Again, poor music and bad poetry may have faultless rhythm, so that rhythm may be treated independently of the other characteristics of music and poetry.

The quantitative relation of syllables to each other is

much more delicately perceived in singing than in reciting. Rhythm of the former kind is indicated by musical notes, of the latter by metrical marks. Recited poetry may be rendered more exact by the accompaniment of some time-measuring device, such as the metronome or *κροφίλαμος*; but even that often regulates the feet rather than the individual syllables.

The ancient musical notes did not indicate quantity, but when the latter had to be marked, as in instrumental music, it was done by writing metrical marks (the same that we use) over the notes. Even the modern system of notation is faulty, being based on the fiction of the "whole note." The whole note has no fixed length, and is not the unit of rhythm (though it may happen to be). The true unit is the bar or measure; hence in  $\frac{1}{2}$ -time, for instance, the so-called  $\frac{1}{2}$ -note is really one-third of the unit. The tempo or time-rate of performance is, in any case, fixed by the composer, and approximately indicated by the words *andante*, *allegro*, etc., or more exactly by indicating how the metronome is to be set.

Each unit of rhythm contains a loud or strong part and a weak part. In beating time the hand or *bâton* descends and remains down during the strong part, then rises and remains up during the weak part (except when the bar calls for more than two movements). The foot, in marching, performs analogous functions. Hence the strong part is called *thesis* (*θέσις*, putting down; also *βᾶσις*, step, and *ἀνὰ χρόνον*, the down time), and the weak part *arsis* (*ἀρσις*, lifting up; also *ἐνὰ χρόνον*, the up time); but in meter many follow the Roman grammarians and interchange the terms *arsis* and *thesis*. Each movement of the hand was called *ictus* (beat) by the Romans, but we apply this term only to the down beat or the accompanying stress.

Bars or measures are to music what feet or measures are to verse; but bars always begin with the stress or musical accent, whereas feet may begin with the weak part. The anapestic dimeter (tetrapody), for instance, has the metrical form | ◡ ◡ ◡ ◡ | ◡ ◡ ◡ ◡ | ◡ ◡ ◡ ◡ | ◡ ◡ ◡ ◡ |; but if sung in  $\frac{1}{2}$ -time it becomes | ◡ ◡ | ◡ ◡ | ◡ ◡ | ◡ ◡ |, bars being supplementary. In verse of this kind the weak part or *arsis* of the first foot is sometimes called *anacrusis* (*ἀνακρουσις*, up beat—a modern use of the word), and the scheme written ◡ ◡ | ◡ ◡ | ◡ ◡ | ◡ ◡ |, etc.

The ancient rhythmists recognized a great variety of compound bars, some of them containing several simple bars or feet, so that a rhythmical bar (*ῥυθμικὸς*) was often really a colon or musical sentence. In modern music the bars or measures most used are:  $\frac{2}{2}$  | ◡ ◡ |,  $\frac{3}{4}$  | ◡ ◡ |,  $\frac{4}{4}$  | ◡ ◡ ◡ ◡ |,  $\frac{3}{2}$  | ◡ ◡ ◡ |,  $\frac{3}{4}$  | ◡ ◡ ◡ |,  $\frac{3}{8}$  | ◡ ◡ ◡ |,  $\frac{6}{4}$  | ◡ ◡ ◡ ◡ ◡ ◡ |,  $\frac{6}{8}$  | ◡ ◡ ◡ ◡ ◡ ◡ |, and analogously  $\frac{5}{4}$ ,  $\frac{5}{8}$ , and  $\frac{1}{2}$ . In  $\frac{1}{2}$ -time the third note receives secondary stress, and in all the bars consisting of multiples of three the first note of each triplet receives stress. It really makes no difference what note is taken as the unit of the measure, so that  $\frac{1}{2}$ -time and  $\frac{3}{4}$ -time, for instance, are practically the same. There are other bars (for instance the very rare  $\frac{5}{4}$ ), but a full discussion of this subject belongs to technical works on music. For the application of rhythm to speech and for the metrical feet of poetry, see METRES, PROSODY, and QUANTITY.

The equalization of seemingly different bars or feet in ancient poetry is the subject of endless controversy, some denying that they were in any way modified from their apparent form, others maintaining that an approximation to equality was made, while still others assert that absolute equality was established. It is certain that in trochaic and iambic meters the seeming spondee, by a partial shortening of one syllable, so that it became irrational (*ἄλογος*) with respect to the other, the foot was made to approximate a pure foot, and there is no proof that it was not by change of tempo made virtually equal to such foot—that is, the trochaic measure — ◡ — is really — ◡ —, in which > is irrational and > is equivalent to — ◡. So the light dactyl, — ◡ ◡, analogous to | ◡ ◡ ◡ |, and the cyclic anapest were probably

made respectively equivalent to the trochee and iambus (See PROSODY.) It must be granted, however, that there were changes of the rhythm in the same composition; but that a change could take place in the same colon seems incredible. MILTON W. HUMPHREYS.

little precise information about him, and the difficulty in this regard has increased by the appearance at the same period of several persons of the same name. At the age of twenty-one he had to leave his home for the court, because of a plague that was devastating his native province. He became the friend of the best poets in Lisbon, Falcão, Sá de Miranda, and Montemayor. He had also a tragic love-adventure, the object of his passion being possibly a certain Donha Joana de Vilhena, cousin of the king, Dom Manuel, and wife after 1516 of Dom Francisco de Portugal, Count of Vimioso. After the failure of his suit he seems to have gone to Spain, and probably to Italy. D. about 1550. He is a noteworthy figure in Portuguese literature, as having been one of the introducers of the Italian pastoral style that has ever since held such sway in Portugal. There are extant five idylls, or *eglogas*, in which experiences of his own and of his poet friends are idealized; and also a pastoral romance in prose, interspersed with verse, in which the main theme is his own love, under the name Bimnarder, for a lady disguised as "Aonia." This romance is commonly called *Menina e Moça*, but the author probably knew it as *Tristeza*, or *Saudades*. Two parts of it have come down to us, but it is uncertain what share, if any, Ribeiro had in the second. The work's chief defect is that so many matters besides the main theme are interwoven as to make the whole extremely confused; yet it had a very great influence in both Portugal and Spain, and to some extent outside the Peninsula. Besides the above Ribeiro wrote a number of lyrics in the style of the older Portuguese poets, some of which are printed in the so-called *Cancioneiro de Resende*. The first edition of the *Menina e Moça* was published at Ferrara in 1554; the second, better known, at Evora in 1557. In 1559 it was again printed with the addition of the lyrics. The *Obras de Bernardim Ribeiro* appeared in 1645, 1785, 1852. An excellent edition of the *Menina e Moça* is that of D. José Pessanha (with *Prefacio*, 1891).

A. R. MARSH.

**Ribera**, rē-bā-rā, José, called *Lo Spagnoletto* (the little Spaniard): painter; b. at Játiva, near Valencia, Jan. 12, 1588. He studied art with Ribalta, and then went to Italy, where in extreme poverty he worked at painting, depending on the charity of his fellow students in Rome. Later he went to Naples, where he married the daughter of a rich picture-dealer, and was employed by the Spanish viceroy, the Count de Monterey, for Philip IV. of Spain. In 1630 the Academy of St. Luke at Rome elected him as one of its members. The pope decorated him with the insignia of the Abito di Cristo in 1644. Some biographers assert that he died in Naples, rich and honored, in 1656, while Dominici, the Italian historian, says that Lo Spagnoletto disappeared in 1648, and was no more heard of. Luca Giordano and Salvator Rosa were his most eminent pupils.

W. J. STILLMAN.

**Ribot**, rē-bō', ALEXANDER FÉLIX JOSEPH: statesman; b. at St-Omer, France, Feb. 7, 1842; was educated for the bar; received an official appointment in 1870, but afterward returned to the practice of his profession in Paris, and in 1878 was elected to the Chamber of Deputies as a representative of the moderate republican party. In 1890 he became Minister of Foreign Affairs, and was Prime Minister from Dec., 1892, to Mar., 1893. In Jan., 1895, he again became Prime Minister after the election of Faure as president of the republic. Ribot is the author of several works, including a biography of Lord Erskine (Paris, 1866). R. A. R.

**Ribot**, AUGUSTIN THÉODULE: genre and portrait painter; b. at Breteuil, Eure, France, Aug. 8, 1823; pupil of Glaize; medals, Salons, 1864 and 1865; third-class medal, Paris Exposition, 1878; Legion of Honor 1878. His work is robust in style and notable for strong modeling. His charcoal drawings are exceedingly good. *St. Sebastian* (1865), *Christ and the Doctors* (1866), and *The Good Samaritan* (1870) are in the Luxembourg Gallery, Paris. D. at Colombes, Seine, Sept. 12, 1891.

W. A. C.

**Ribot**, THÉODULE ARMAND: psychologist; b. at Guingamp, France, Dec. 18, 1839; educated at the Lycée de St-Brieuc and at the École Normale in Paris; was professor in different lycées 1869-71; engaged in laboratories and clinics in Paris until 1876; founder and editor of *La Revue Philosophique* 1876-94; lecturer at the Sorbonne 1885-88; professor in the Collège de France since 1888. His principal works are *La Psychologie anglaise contemporaine* (1870); *L'Hérédité psychologique* (1873; 4th ed. 1892); *La Psychologie allemande contemporaine* (1879; Eng. trans. 1886); *Les*

*Maladies de la Mémoire* (1881; 9th ed. 1894); *Les Maladies de la Volonté* (1883; 10th ed. 1894); *Les Maladies de la Personnalité* (1885); and *La Psychologie de l'Attention* (1889). J. MARK BALDWIN.

**Ribs** [O. Eng. *rib*: O. H. Ger. *rippa* (> Mod. Ger. *rippe*: Icel. *rif* < Indo-Europ. *rebhya-*; cf. O. Bulg. *rebroy*, rib): the curved bones which form the lateral framework of the thorax or chest. They serve as substantial points of attachment for the thoracic muscles, which perform the respiratory motions, and by their resistance and elasticity protect the lungs, heart, and great vessels from external violence and injury. The ribs, in man, are usually twenty-four in number, twelve on each side, but may be one or two more or less in exceptional cases. They are articulated to the spine behind, but in front only the upper seven are connected with the sternum or breast-bone by intervening costal cartilages. Of the remaining five, three connect with the cartilage of the seventh, while the lower two are unattached and termed free or floating ribs. The ribs are elastic, and being articulated in front and behind move freely upward and outward in inspiration, and reversely downward and inward in expiration. The ribs, like other bones, may be inflamed and thickened from contusion or from blood-disease; they are often distorted by collapse of a part or whole of a lung and external atmospheric pressure. The chief injuries to the ribs are separation from their attachments to the spine or sternum, and fracture. The fractured rib is detected by local crepitation of the fragments in respiratory movement, and by the severe local stitch or pain it gives the patient. The treatment consists in application of a firm bandage or broad adhesive band around the body to suspend thoracic movement until the rib is united; respiration meanwhile is conducted chiefly by motion of the diaphragm. Revised by W. PEPPER.

**Ricardo**, DAVID: political economist; b. in London, Apr. 19, 1772. His father, who was a Jew and a native of Holland, settled in London, and as a member of the Stock Exchange gained a fortune. David Ricardo was a partner with his father till in 1793 he embraced the Christian faith and formed a marriage connection contrary to his father's wishes, which caused the partnership to be dissolved. Through the aid of other members of the Stock Exchange the younger Ricardo started in business by himself, and succeeded in a few years in securing a fortune. He then gave his time to the study of mathematics, chemistry, mineralogy, and geology, and was active in securing the organization of the London Geological Society. In 1809 he published a tract entitled *The High Price of Bullion, a Proof of the Depreciation of Bank-notes*; in 1817 published his most important work on *The Principles of Political Economy and Taxation*. Its leading feature was a theory of rent, which, though embodying ideas before announced by others, was received by the public as a new and important theory, especially in connection with the theory of Malthus on population, then much discussed. He subsequently became a member of Parliament, where he took a prominent part in the discussion of economic questions. D. at Gatscomb Park, Gloucestershire, Sept. 11, 1823. Ricardo stands next to Adam Smith in the British free-trade school of political economists, and his writings have exerted a powerful influence upon subsequent students of the science. A collection of his works, edited by J. R. McCulloch, was published in 1846, and his *Letters to Malthus* appeared in 1887. Revised by F. M. COLBY.

**Ricasoli**, rē-kaa'sō-lē, BETTINO, Baron: statesman; b. in Florence, Mar. 9, 1809, of an old noble Florentine family. In 1848 he was a prominent advocate of the unity of Italy, was elected to the Tuscan parliament, and was offered a place in the ministry, which he declined, as the grand duke had turned against the democratic movement. After the defeat of Novara, hoping to prevent the entrance of the Austrians into Tuscany, he took the initiative in recalling the grand duke, but retired from the court when the latter withdrew the constitution. In 1859 he again put himself at the head of the Tuscan liberal movement, and aided in the expulsion of the grand duke, and, as provisional dictator, in the union of Tuscany with Piedmont. This being accomplished, he was appointed governor-general of Tuscany, an office which he held till Mar., 1861. The city of Florence elected him deputy to the Italian parliament, and after the death of Cavour he became president of the council in the new ministry which was afterward overthrown by the opposition of Rattazzi. In June, 1866, Baron Ricasoli returned to power and resumed the direction of public affairs, but

grain. The primitive method of removing the hull was by hand, using a pestle and mortar. The mortar was a large block of wood set on end; the pestle was about 2½ inches in diameter, and 2 feet long. By light pounding and then winnowing the hull and the cuticle were removed and the grain was fitted for use.

In a modern rice-mill the rice is emptied from a sack into a hopper at the storehouse; it passes from the hopper into a large fanning-mill or separator, where it is freed from all foreign substances; it is then transferred to the mill by a belt-conveyor; the hull is removed by passing the grain between heavy millstones (about 5 feet in diameter) which revolve rapidly, but are not close enough together to break the kernel; it then goes to the mortar and is pounded for two hours, or in some mills the Engleburg huller is used in place of the pounding process; by these processes the hull and cuticle are removed and the grain is scoured. The hulls are disposed of as worthless refuse; the cuticle and undercoat-scoured off are the rice-bran. The rice then passes through an inclined cylindrical wire revolving screen, with the meshes becoming coarser toward the lower end, thus assorting the rice into three or four grades; the finest is the brewers' rice, the second—a middling rice—includes the larger broken rice, and the third is the whole rice or head rice; the head rice passes from the screen into the polisher, where it is brushed and finished. Rice-bran and rice-polish are excellent food for cattle and hogs, rating higher than wheat-bran and wheat-middlings; brewers' rice is used for the production of light beer, and usually brings about one-half the price of head rice; middling rice sells for nearly one cent per pound less than head rice.

Rice as a food (see Food) is deficient in the flesh-forming principles, but its almost perfect digestibility increases its food-value 20 or 25 per cent., and makes it exceedingly valuable for the sick or people inclined to dyspepsia. Physicians quite generally prescribe a rice diet in some form where there is any inflammation of the mucous membrane, whether of the lungs, stomach, or bowels. Two precautions should be observed: the rice should be more than three months old, and should be thoroughly cooked. With beef, fish, milk, cheese, or beans it makes a well-balanced nutritive ration. In warm countries rice is extensively used in meat soups and as a substitute for the potato. No meal is considered complete without it in some form. It is made into bread, puddings, biscuits, griddle-cakes, and other food. It makes an effective paste, and in Oriental countries it is used in the production of a spirituous liquor known as arrack.

Rice-straw is more palatable to animals than oat-straw, and preferred as a coarse fodder; it is largely used for wintering stock. It makes an excellent quality of paper.

Rice production in the U. S. attained considerable proportion in the colonial times. In 1707 seventeen ships left South Carolina with cargoes of rice. In 1730 the product was 21,153,054 lb.; in 1755 it reached 50,747,060 lb.; and in 1770, 75,264,500 lb. This was raised with slave-labor, and mostly exported to Europe and the West Indies. For the next seventy years there was practically no increase. The product of 1840 was 84,145,800 lb. In 1860 it was 117,885,000 lb. During the civil war little rice was raised, and in 1865 the total amount was only 4,740,580 lb. In 1880 it had increased to 85,596,800 lb.; in 1890 to 131,722,000 lb.; and in 1893 to 237,546,900 lb., of which amount Louisiana produced 182,400,000 lb., North Carolina 6,818,400 lb., South Carolina 33,250,500 lb., and Georgia 15,078,000 lb. This marvelous increase in Louisiana was due to the introduction and adaptation of the most improved agricultural machinery. The crop in 1894 fell off nearly one-half; this was due to drought in Louisiana and floods in the other States.

S. A. KNAPP.

**Rice, JAMES:** novelist; b. in Northampton, England, in 1844; was educated at Queen's College, Cambridge; called to the bar in 1871; edited *Once a Week* 1868-72; and for eight years was London correspondent of the *Toronto Globe*. D. in London, Apr. 25, 1882. He was joint author with Walter Besant of many novels. See BESANT, WALTER.

H. A. BEERS.

**Rice-bird, or Rice-bunting:** the BOBOLINK (*q. v.*); the JAVA SPARROW (*q. v.*) is also called rice-bird.

**Rice, Indian, Water-rice, or Water-oats:** an annual aquatic grass (*Zizania aquatica*) belonging to the true rice tribe, though of inferior value, from 5 to 10 feet high, which abounds in marshy regions of the U. S., especially in Minnesota. Its grain was formerly much used by the Dakota

and Chippewa Indians, and forms an important portion of the food of the game-birds of the Northwest. Its stem is employed as a paper-stock.

**Rice Lake:** city; Barron co., Wis.; on the Red Cedar river, Rice Lake, and the Chi., St. P., Minn., and Omaha Railway; 48 miles N. of Menomonie, 56 miles N. of Eau Claire (for location, see map of Wisconsin, ref. 3-B). It is in an agricultural and lumbering region, is engaged in manufacturing, and has a State bank with capital of \$50,000, a private bank, and a weekly newspaper. Pop. (1880) 362; (1890) 2,130.

**Rice-paper:** See PAPER.

**Rich, EDMUND (Saint Edmund):** Archbishop of Canterbury; b. at Abingdon, England, about 1170; educated at Oxford, where he "wedded the Virgin Mary," as he called his vow of special service, and at Paris; became an instructor at Oxford, where the university was then developing a revival of scholarship; was prebendary of Calne and treasurer of Salisbury Cathedral 1219-22; was a famous preacher at the pope's command preached the crusade over a considerable part of England, probably in 1227; was appointed Archbishop of Canterbury 1233, and was consecrated Apr. 2, 1234; exhibited energy as a reformer in the face of opposition from the clergy and from the Roman hierarchy; went to Rome in 1238 and again in 1240 to settle various difficulties with his monks, but finding that the pope demanded more and more unreasonable concessions he resigned his see and retired to the monastery of Pontigny, in France, in the summer of 1240; thence a little later he went for his health to the priory of Soissy, where he died, Nov. 16, 1240. His remains were taken to Pontigny, and having been canonized by Innocent IV. in 1247, his shrine (known in France as that of St. Edme) became a place of pilgrimage. Cardinal (then Archbishop) Manning and Lord Edmund Howard with 500 British pilgrims, went thither to invoke his intercession in behalf of the Roman Catholic Church Sept. 2, 1874. He wrote a volume of *Constitutions* in thirty-six canons (1236), *Speculum Ecclesie*, and left MS. treatises now in the Bodleian Library. There is a MS. biography by his brother Robert in the Cottonian collection. Another written by Bertrand, prior of Pontigny, was published in Martène's *Thesaurus Anecdotorum*, iii., 1774-1826; of Hook's *Lives of the Archbishops of Canterbury*, s. v.

Revised by S. M. JACKSON.

**Richard I. (PLANTAGENET),** surnamed CŒUR DE LION (lion-hearted); King of England; third son of Henry II. and Eleanor of Aquitaine; b. at Oxford, Sept. 13, 1157; was noted from youth for rash valor and a turbulent disposition received the duchy of Aquitaine by the treaty of Montmirail (Jan. 6, 1169), under the feudal supremacy of King Louis VII. of France, to whose youngest daughter, Adelaide, he was at the same time betrothed; joined his mother and his two brothers in rebellion against his father 1173; was reconciled to him Sept., 1174; became involved in wars with his brothers, but was reconciled to them in London in 1184. He also made war upon the Count of Toulouse, aided his father against Philip Augustus, and later, in alliance with Philip Augustus, waged successful war on his father. Succeeding to the throne in July, 1189, he spent a few months in arranging the affairs of the kingdom, and then set out on the third crusade, July, 1190, with the King of France. On his way to the Holy Land he captured Messina and conquered the island of Cyprus. Arriving before Acre June 8 he took part in the capture of the city, but soon quarreled with the French king, who returned to France. Richard advanced immediately toward Jerusalem; defeated the Saracens at Arsuf in September; took and fortified Jaffa; advanced on Askalon, which he took Jan., 1192; set out twice for Jerusalem, but was called back each time by hostilities in his rear; lost and regained Jaffa; performed many brilliant exploits of personal valor, but, being obliged by the state of affairs in England to return, made a truce with Sultan Saladin, and sailed from Acre in October. On his way home he was shipwrecked at the head of the Adriatic; endeavored to make his way by land through Austria; was seized and imprisoned by Leopold, Duke of Austria, with whom he had quarreled in the Holy Land; was handed over to the Emperor of Germany, by whom he was detained more than a year; was liberated on pledge of a heavy ransom \$ Feb., 1194; found his brother John assuming the functions of king, but soon forgave him; engaged in a war with Philip Augustus of France, whom he defeated and forced to sign a disadvantageous truce, and renewed the war three years

He has been since 1854 an earnest advocate of advance in national sanitation, and a zealous partisan of the temperance movement. Since 1884 he has been the author and editor of a quarterly journal, *The Asclepiad*. Among his works are *The Health of Nations* (London, 1887); *National Health* (London, 1890).  
Revised by S. T. ARMSTRONG.

**Richardson, CHARLES**: philologist; b. in England in July, 1775; studied but never practiced law; devoted himself to literature in London; published *Illustrations of English Philology* (1815); undertook the lexicographical articles in *The Encyclopedia Metropolitana*, for which he also prepared his great work, a *New Dictionary of the English Language*, which (the first part appearing in 1818) was suspended soon afterward by the failure of the proprietors, and completed (as a separate work) in 1837. The complete work appeared in new editions in 1837, 1838, and 1839. Richardson also published a *Supplement* to his dictionary (1855), a work *On the Study of Language* (1854), and an *Historical Essay on English Grammar and English Grammarians*, several philological papers in the *Gentleman's Magazine*, and some comments on Shakspeare: was a contributor to *Notes and Queries*; received a pension from 1852 until his death at Feltham, Middlesex, Oct. 6, 1865.

**Richardson, CHARLES FRANCIS**: scholar; b. at Hallowell, Me., May 29, 1831. He graduated at Dartmouth College 1871, was connected with the *New York Independent* 1872-78, and in 1882 was appointed Professor of English at Dartmouth. He has published *A Primer of American Literature* (1876); *The Cross*, a volume of poems (1879); *The Choice of Books* (1881); and *American Literature* (2 vols., 1887-89).  
H. A. B.

**Richardson, SAMUEL**: novelist; b. in Derbyshire, England, about 1689; learned the printing-trade; became a publisher in London, printer of the journals of the House of Commons, master of the Stationers' Company, and purchased in 1760 a half-interest in the office of king's printer. D. in London, July 4, 1761. His novels *Pamela* (1740, with a continuation in 1741), *Clarissa Harlowe* (1748), *Sir Charles Grandison* (1754) enjoyed an unbounded success, and had numerous imitators not only in England, but in Germany and France, where they profoundly influenced the whole development of prose fiction. Richardson is the first English novelist. His novels are all in the form of letters, and are long and sentimental. They show little acquaintance with men on the part of their author, but an intense and sympathetic absorption in the feelings of the female heart, and they had their strongest popularity among women. See ENGLISH LITERATURE.

Revised by H. A. BEERS.

**Richardson, WILLIAM ADAMS, LL.D.**: jurist and financier; b. at Tyngsborough, Mass., Nov. 2, 1821; graduated at Harvard 1843; admitted to the bar at Boston 1846; practiced law at Lowell; was one of the revisers of the *General Statutes of Massachusetts* (1860), and of the *Supplement* to the same (1863-64); became judge of probate 1856, Assistant Secretary of the Treasury 1869-73, and was secretary 1873-74; Judge of U. S. court of claims since 1874, and chief justice of same since Jan. 20, 1885; published *The Banking Laws of Massachusetts* (Lowell, 1855); *Practical Information concerning the Public Debt of the United States*, with the *National Banking Laws* (1872); *History of the Court of Claims* (1882-85), and other works.

**Richardt, CHRISTIAN ERNST**: poet; b. in Copenhagen, Denmark, May 25, 1831. After studying theology he accepted a call to a country church, and continued to be a parish priest until his death. During the last years of his life he was chaplain of Vemmetofte Cloister in Zealand. His first work was a comedy, *Deklarationen* (1851), which was later produced at the Royal theater. In 1861 appeared *Smaadigte*, consisting of a number of delicate lyrics; in 1874 *Billeder og Sange* (Pictures and Songs); in 1878 *Halvhundrede Digte* (Fifty Poems); in 1884 *Vaar og Høst* (Spring and Autumn); and in 1891 *Blandede Digte* (Miscellaneous Poems). His tragic music-drama *Drot og Marsk* (King and Constable, 1878), with music by P. Heise, is one of the most popular pieces in the repertory of the Royal theater. In his religious depth, his patriotic enthusiasm, and his sincere love of nature, he stands first in later Danish lyrical poetry. D. 1893. His collected poems were published in Copenhagen in 1894.  
D. K. DONGE.

**Richellieu**, rê-she-loo', also called **Sorel**, or **Chambly**: an historic and beautiful river of Quebec, Canada; right-

hand affluent of the St. Lawrence, discharging Lake Champlain; length, 80 miles. Its course is northerly and very straight; the width, at first 1 or 2 miles, becomes gradually contracted to 1,000 or 1,200 feet. It is navigable, except for rapids between St. John and Chambly, and this gap is supplied by a canal. Navigation closes between Nov. 16 and Dec. 18, and opens between Mar. 20 and May 1. The valley is fertile and attractive, and in it were made some of the earliest settlements in the province. It also served as a battle-ground for over two centuries, beginning with Champlain's Iroquois campaign in 1609.  
M. W. H.

**Richellieu** (Fr. pron. rê-sh'li-ô'), ARMAND JEAN DUPLESSIS, de, Duke and Cardinal: statesman; b. in Paris, France, Sept. 5, 1585; was educated for the military profession in the Collège de Navarre, but, having a prospect of succeeding to the bishopric of Luçon, did not enter the army, but studied theology, and was consecrated bishop Apr. 16, 1607. Elected a deputy of the clergy to the States-General in 1614, he allied himself with the queen-mother and regent, Marie de Médicis; was appointed her almoner, and became a member of the council of state. When, shortly after, dissensions broke out between the king (Louis XIII.) and his mother, Richellieu accompanied the latter to Blois, and retired subsequently to his diocese, but succeeded, nevertheless, in bringing about a reconciliation between mother and son; was rewarded with the cardinal's hat in 1622; re-entered the council of state, and was soon after made prime minister, which office he filled uninterruptedly to his death, exercising a most decisive influence on the history of France, externally and internally. His foreign policy centered in the idea of humiliating Austria. For this purpose he encouraged the rising of the Protestant princes in Germany, the revolution of the provinces in the Netherlands, and even the revolt in Catalonia. He subsidized Gustavus Adolphus, and after the death of the latter he took the Duke of Saxe-Weimar and his army into the French service, and carried on the war against the emperor with great vigor. He also declared war against Spain, and although his plans in the Netherlands failed, he succeeded in separating Portugal from Spain in 1640, and conquered Perpignan in 1642. The final results of these wars he did not live to see, but by the Peace of Westphalia (1648) the progress of the house of Austria was effectually checked and its dream of establishing a world-empire was destroyed. By his internal policy he finished what Louis XI. had begun—the overthrow of the feudal power of the nobility. His government was marked by an almost uninterrupted series of conspiracies among the feudal nobility of the realm, headed by the queen-mother (whose favor had turned into a deadly hatred), by the queen herself, Anne of Austria, by Gaston of Orleans, the brother of the king, and by the royal princes. A master in intrigue and the very genius of detective police superintendence, he was always well informed and fully prepared, and punished the conspirators with merciless severity. The king felt a deep antipathy against him, and on this circumstance the first conspirators based their hope of overthrowing him. With the king, however, this almost physical aversion was wholly overawed by a mixture of admiration and fear of the towering spirit of his minister, and on Nov. 11, 1630 (*la journée des dupes*), when the king had consented to his dismissal and the whole court exulted, Richellieu forced himself into the presence of Louis, turned him around in a moment, and reappeared with great dramatic effect among his enemies, stronger than ever. Afterward the conspirators sought and found support in foreign countries, especially in Spain, and Richellieu needed arms to maintain himself, but he proved unconquerable. Marie de Médicis fled from place to place in foreign countries; Gaston of Orleans was made utterly contemptible by his cowardly submission; Montmorency, Marillac, Cinq-Mars, and many others were beheaded. The scaffold, the dungeon, and exile were the end of all resistance to him who wielded the royal power. Besides the feudal nobility, there was another political power in France at the time when Richellieu took the reins—namely, the Huguenots—and to crush this young but steadily increasing influence was one of the three great objects of his policy. He laid siege to their principal stronghold, La Rochelle, and this siege is one of the most memorable events in the history of France. On Oct. 28, 1628, the city surrendered, four-fifths of its inhabitants having perished by the sword and by famine. By the fall of La Rochelle the political power of the Huguenots was wholly broken, but Richellieu's further measures concerning them were moderate and even magnanimous. The cardinal

**Richmond:** city of Victoria, Australia; 2 miles E. of Melbourne (see map of Australia, ref. 8-H). Pop. (1889) 37,550. It has a distinct municipality and the rank of a city, but is really only a suburb of Melbourne.

**Richmond:** *chef-lieu* of the counties of Richmond and Wolfe, Canada; on the St. Francis, a tributary of the St. Lawrence; 76 miles E. of Montreal (see map of Quebec, ref. 5-C). It is an important center of the Grand Trunk Railway, the Portland section extending from it 221 miles, the Montreal section 76 miles, and the Quebec branch 96 miles. The river is spanned by a passenger-bridge connecting the picturesque village of Melbourne with Richmond. St. Francis College, an institution affiliated to McGill University, is situated on a commanding site at the upper end of the town. Two newspapers are published in the place. The chief industry is connected with the railway-works and machine-shops. Pop. (1890) 2,056. J. M. HARPER.

**Richmond:** city; capital of Wayne co., Ind.; on the Whitewater river, and the Grand Rapids and Ind. and the Pitts., Cin., Chi. and St. L. railways; 68 miles E. of Indianapolis, 92 miles S. by E. of Fort Wayne (for location, see map of Indiana, ref. 6-G). It is in an agricultural region, has an elevation of 700 feet above tide-water, and is engaged in manufacturing and in general trade. The city has gas and electric-light plants, an abundant supply of natural gas for fuel, excellent water and drainage systems, and electric street-railways. There are 21 churches, 9 public-school buildings, a high school, public-school property valued at about \$300,000, Earlham College (Orthodox Friends, opened in 1847), 5 libraries (Earlham College 3, Morrison Public, and County Law) containing over 27,000 volumes, 3 national banks with combined capital of \$450,000, 4 building and loan associations, and a semi-monthly, a quarterly, 4 daily, 7 weekly, and 3 monthly periodicals. In 1890 there were 293 manufacturing establishments, which had a combined capital of \$4,000,000, employed about 3,000 persons, and had products valued at about \$6,000,000. The public buildings include a new county court-house, a new State asylum for the insane, two orphans' homes, a Home for Friendless Women, and a city hospital. Pop. (1880) 12,742; (1890) 16,608.

**Richmond:** town; capital of Madison co., Ky.; on the Louis. and Nash. and the Rich., Nicholasville, Irvine and Beattyville railways; 25 miles S. S. E. of Lexington, 54 miles S. E. of Frankfort, the State capital (for location, see map of Kentucky, ref. 3-I). It is in an agricultural region; is noted for breeding horses, mules, and cattle; and contains the Central University (Southern Presbyterian, chartered in 1873), 4 national banks with combined capital of \$750,000, and a monthly and 2 weekly periodicals. Pop. (1880) 1,424; (1890) 5,073.

**Richmond:** town; Sagadahoc co., Me.; on the Kennebec river, and the Maine Central Railroad; 17 miles S. of Augusta, and 44 miles N. E. of Portland (for location, see map of Maine, ref. 10-C). It is principally engaged in the manufacture of boots and shoes, has sawmills and planing-mills, and contains a public high school, public library (founded in 1868), two national banks with combined capital of \$170,000, and a weekly and a monthly periodical. Pop. (1880) 2,658; (1890) 3,082.

**Richmond:** city; capital of Ray co., Mo.; on the Atch., Top. and S. Fé Railroad; 40 miles E. of Kansas City, 68 miles S. E. of St. Louis (for location, see map of Missouri, ref. 3-E). It is in an agricultural and coal-mining region, and contains several flour-mills, foundry, public high school, Woodson Institute, new water-works plant, electric lights, 3 State banks with combined capital of \$200,000, and a daily and 3 weekly newspapers. Pop. (1880) 1,424; (1890) 2,895; (1894) estimated, 3,500. EDITOR OF "DEMOCRAT."

**Richmond:** city (named after Richmond, Surrey, England); port of entry; capital of Virginia and of Henrico County; on the north branch of the James river, and the Ches. and Ohio, the Richmond and Petersburg, the Rich., Fredericksburg and Potomac, and the Southern railways; 100 miles S. by E. of Washington, D. C., 127 miles N. W. of the Atlantic Ocean (for location, see map of Virginia, ref. 6-H). It has an area within incorporated limits of 485 sq. miles, and with suburbs of about 16 sq. miles; is built on a series of hills, and ranges in altitude above sea-level from 172 to 249 feet. The river is here crossed by five bridges, connecting the city with Manchester, Spring Hill, and other suburban places. There are 106 miles of streets, generally

wide, of which 36 miles are sewered and 23 miles paved; sidewalks are chiefly of brick. Main Street is the principal business thoroughfare; Broad Street is the widest; West Franklin and Grace contain the most fashionable residences. The streets are lighted by gas and electricity, and the principal ones are traversed by electric and horse railways. The supply of water for domestic and fire purposes is obtained from two points on the river above the city, where it is pumped into two large reservoirs for distribution. Both the gas and water-works plants are owned by the city.

State Capitol, Richmond, Va.

**Parks and Public Buildings.**—The most noted of the parks and squares, which comprise 357 acres in all, is Capitol Square, a tract of 12 acres on the summit of Shockoe Hill. It contains the State Capitol, a Græco-composite building with a portico of Ionic columns, erected in 1796 after the plans of the Maison Carrée of Nîmes, France. The building contains Houdon's marble statue of Washington, and many portraits of governors, military officers, and other distinguished Virginians; the two legislative halls; and the State Library, in which are preserved the parole signed by Lord Cornwallis at Yorktown, the original Virginia bill of rights, and the Virginia ordinance of secession. The park surrounding the Capitol has three fountains; Crawford's equestrian statue of Washington surrounded by bronze statues of Patrick Henry, John Marshall, Andrew Lewis, George Mason, Thomas Jefferson, and Thomas Nelson, by Crawford and Rogers; Foley's bronze statue of "Stonewall" Jackson; and Hart's marble statue of Henry Clay. Other public buildings on the square are the Governor's mansion, the new Public Library, and the old bell-house. The largest park, of 300 acres, contains the new reservoir, a beautiful lake, and a fine boulevard, and is a favorite resort. Libby Park, on Libby Hill, is terraced from the summit to Main Street, and on its highest point has a Confederate Soldiers' and Sailors' Monument. Monroe Park contains a statue of Gen. W. C. Wickham. Chimborazo Hill Park has an area of 36 acres, and an elevation of 200 feet. Howitzer Place has a monument in memory of the Richmond Howitzer battalion. Gamble's Hill Park is on the James river and Kanawha Canal, and Jefferson Park is between Marshall and Pleasant Streets. Lee Circle, in the west of the city, contains a bronze equestrian statue of Gen. Robert E. Lee. In Hollywood Cemetery, where 12,000 Confederate soldiers lie, is a memorial of rough blocks of granite, forming a pyramid 90 feet high, erected by the women of Richmond. Other notable buildings are St. John's Protestant Episcopal church, on Church Hill, in which Patrick Henry made his famous declaration for liberty or death; the Colonial Stone House on Main Street, believed to have been occupied by Washington; the "White House of the Confederacy," the home of Jefferson Davis during the civil war, and now a museum for Confederate relics; the Masonic Temple, the first erected in the U. S. (corner-stone laid 1785); Monumental church (Protestant Episcopal), erected on the site of the theater burned in 1811, when sixty lives were lost; two armories; St. Luke's Hospital; Retreat for the Sick; Lee Camp Soldiers' Home; the Male and Female Orphan asylums; the Virginia Medical College; the Colored Baptist church, in which the constitutional convention of 1850-51 was held; and the penitentiary, to which a farm is now attached.

tempts were not successful. His *Grönländische Prozesse* (Lawsuits in Greenland, 2 vols., 1784) and *Auswahl aus des Teufels Papieren* (Selections from the Papers of the Devil, 1789) were not read; their satire is narrow, their humor forced, their form unripe. In 1793 his romance, *Die Unsichtbare Loge* (The Invisible Lodge, 2 vols.), turned the scales of fortune, and now followed in rapid succession, and with decided success, *Hesperus* (4 vols., 1795), *Biographische Belustigungen unter der Gehirnschale einer Riesin* (Biographical Recreations under the Cranium of a Giantess, 1796), *Leben des Quintus Fixlein* (1796), *Blumen-, Frucht- und Dornenstücke, oder Ehestand, Tod und Hochzeit des Armenadvocaten Siebenkäs* (Flower, Fruit, and Thorn Pieces, or Marriage, Death, and Wedding of Lawyer Siebenkäs, 4 vols., 1797), *Der Jubelseniör* (1797), *Das Kampaner Thal* (1797). These writings made Richter the literary favorite of Germany. In 1794 he gave up his position as a schoolmaster, and began a life of visits to the different literary centers—Leipzig, Weimar, Dresden, and Berlin. He was everywhere well received, and made many intimate friends, among whom, however, Goethe and Schiller were not. It was especially the fair sex which was enthusiastic about him. In 1801 he married in Berlin the beautiful and spirited Caroline Mayer, and removed first to Meiningen, then to Bayreuth. From the prince-primate Dalberg he received an annual pension of 1,000 florins, which was continued afterward by the King of Bavaria, and the University of Heidelberg made him a doctor. In 1803 he published his *Titan*, and in 1804 *Die Flegeljahre* (Wild Oats, 4 vols.), which two romances, together with his first philosophical attempt, *Vorschule der Ästhetik* (Introduction to Aesthetics, 3 vols., 1805), may be considered as indicating the culmination of his talent. In 1807 he wrote another philosophical book on education, *Levana oder Erziehungslehre*, and in the following years he published a great number of political and satirical pamphlets, sermons, humorous sketches, etc. D. at Bayreuth, Nov. 14, 1825. Richter is without doubt the greatest humorist of modern German literature, but his utter disregard for literary form, the lack of artistic composition, and his barbarous style make it a laborious task to read and enjoy him. Having, however, penetrated the hard shell of the imperfect form of his writings, one finds him a poet of divine inspirations, lofty sentiments, and irresistible humor. In order to do him justice it is necessary not only to consider him in his literary relations to the earlier English and German humorists, like Swift, Sterne, Hippiel, Lichtenberg, and others, but also to keep in mind the miserable political and social conditions of Germany in his time and the strong current of sentimentality which had not been checked by the classic productions of Goethe and Schiller. While these latter poets and their followers had created in their works an ideal poetic world unconcerned about the miserable conditions around them in which they really lived, Richter makes the very contrast between the German idealism and the prosaic reality of his time the subject-matter of his humorous representations. With a loving spirit he embraces the lowest and most humble in this prosaic reality, and thus he produces idyls like *Quintus Fixlein*, *Leben Fibels*, etc., in which his contemporaries found a picture of their own life, and which we could call classic but for their poor literary form. He is especially great in his descriptions of nature, while in the delineation of human characters he is frequently less successful. As defective as his style was, it found a great many imitators. The tendency which prompts authors like Börne, Heine, and their literary offspring to parade their vain subjectivity is due to the example of Richter, to whom Heine especially owes more than he might have been willing to acknowledge.

See R. O. Spazier, *Jean Paul Fr. Richter, ein biographischer Commentar zu dessen Werken* (1833); E. Förster, *Denkwürdigkeiten aus dem Leben J. P. F. Richters* (1863); Fr. Th. Vischer, *Kritische Gänge*; G. Nerlich, *Jean Paul und seine Zeitgenossen* (1889); Carlyle, *Essays*.

**Richtshofen**, richt'hō-fen, Baron FERDINAND, von, Ph. D.: geologist and geographer; member of a distinguished Silesian family; b. at Carlsruhe, Germany, May 5, 1833; studied at Breslau and Berlin 1850-56. During 1856-60 he was in Austria studying the geology of the Tyrol, Siebenbürgen, and Northeastern Hungary. He then accompanied, as geologist, Count Eulenberg on the Prussian expedition to the far East, and remained twelve years in China, Indo-China, Java, Celebes, the Philippine islands, Formosa, Japan, Cali-

fornia, and Nevada, returning to Europe in 1872. Since this time he has remained in Europe, engaged in working up the results of his journeys and in professional and other geographic and geologic pursuits. His publications have been numerous, among them the following in English: *The Comstock [Nev.] Lode* (1865); *Principles of the Natural System of Volcanic Rocks* (1867); *Letters to the Shanghai Chamber of Commerce* (1869-72). The most noteworthy of his works is *China, Ergebnisse eigener Reisen und darauf gegründeter Studien* (vol. i., 1877; vol. ii., 1882; vol. iii., 1883). For the family, consult *Geschichte der Familie Richter von Richtshofen* (1884). MARK W. HARRINGTON.

**Richwood**: village; Union co., O.; on the Erie Railroad: 15 miles S. W. of Marion (for location, see map of Ohio, ref. 4-E). It is in an agricultural region, and has 2 large flour-mills, 2 steam tile-mills, several large grain elevators, a planing-mill, 2 private banks, and 2 weekly newspapers. Pop. (1880) 1,317; (1890) 1,415. PUBLISHER OF "GAZETTE."

**Ric'inus**: See CASTOR-OIL PLANT.

**Rickets**: a disease characterized by deformities of the bones and various visceral disturbances. It occurs as a rule in infants from twelve to eighteen months of age. The predisposing causes are the influence of bad hygienic surroundings, and improper food and clothing. The symptoms develop gradually and almost imperceptibly. The little patient seems to lose spirit, and indigestion sets in, accompanied by swelling of the abdomen and colic. There is early a tendency to sweating about the head and restlessness during sleep. The muscles become soft and flabby, the face sallow, and the skin dry, and there is scanty and turbid urine and thin fetid evacuations. The fontanelles and sutures remain open until a late period. The teeth are very late in making their appearance, and decay rapidly after doing so. As the disease advances the bones grow softer, and become distorted by the superincumbent weight and muscular contraction. Various deformities of the head, limbs, chest, and pelvis are brought about. (See ORTHOPÆDIC SURGERY.) As a disease of the bones, rickets is never dangerous. It is from the deformities resulting, and their interference with the action of the lungs and other viscera, that the danger arises. The treatment can be summed up in a few words—fresh air, sunlight, good food, bathing, and cod-liver oil. It is remarkable that rachitic children frequently develop and become unusually strong, though deformed, in adult years. Many, too, are brilliant mentally, as the records of great names in literature and science show.

**Ricketts**, JAMES BREWERTON: soldier; b. in New York, June 21, 1817; graduated at U. S. Military Academy, and entered the artillery July, 1839; served in the Mexican war and on frontier duty up to 1861, when as captain he commanded a battery in the capture of Alexandria May 24, as in the battle of Bull Run July 21, 1861, where he was severely wounded, and from which date he was breveted lieutenant colonel and made brigadier-general of volunteers. He was engaged in the battle of Cedar Mountain, at the second battle of Bull Run, and at Chantilly commanded a division, as at South Mountain and Antietam; major First U. S. Artillery June, 1863; participated in the final Richmond campaign in command of a division from the battles of the Wilderness to the investment of Petersburg; recalled to Washington July, 1864, to aid in the defense against Early's threatened attack, and engaged in the subsequent pursuit of Early's army, participating in the battles of Monocacy, Opequan, Fisher's Hill, and Cedar Creek, where he was severely wounded; breveted major-general for gallantry; in Jan., 1867, was retired on the full rank of major-general. D. at Washington, D. C., Sept. 22, 1887. JAMES MERCUR.

**Ricketts**, PALMER CHAMBERLAINE, C. E.: civil engineer and educator; b. at Elkton, Md., Jan. 17, 1856; educated at the Rensselaer Polytechnic Institute, Troy, N. Y., where he graduated in 1875. During 1875-84 he was Assistant Professor of Mathematics; since 1884 has been Professor of Mechanics, and since 1892 director of the Rensselaer Polytechnic Institute. He has been consulting bridge-engineer for two railways, and since 1891 engineer of the public improvement commission of Troy, N. Y. In 1891 he was appointed brigadier-general and chief of engineers of the State of New York. He is the author of reports and technical discussions in engineering periodicals.

**Rico**, ree'ko: town; capital of Dolores co., Col.; on the Dolores river, and the Rio Grande Southern Railroad; 60

and W. on Long-st. 105 miles N. to W. of Annapolis. The mountain is covered by forest, and is the site of a small town. The mountain is covered by forest, and is the site of a small town. The mountain is covered by forest, and is the site of a small town.

**John W. Brown**, American painter, b. in Montreal, Quebec, Canada, in 1850. He studied in the Académie de Beaux-Arts, Paris, France, and in the Académie de Beaux-Arts, Paris, France. He studied in the Académie de Beaux-Arts, Paris, France, and in the Académie de Beaux-Arts, Paris, France.

**Howard W. Brown**, American writer, b. in New York, N. Y., in 1850. He studied in the University of the City of New York, and in the University of the City of New York. He studied in the University of the City of New York, and in the University of the City of New York.

**Ridgeville**, town of County Kent, Ontario, Canada; half way between the Thames river and the north shore of Lake Erie; a station on the Michigan Central railroad.

**Ridgeville**, town, Randolph Co., Ind.; on the Mississippi river, and the Great Rapids and the Falls. It is a small town, and is the site of a small town. It is a small town, and is the site of a small town.

**Ridgway**: borough; capital of Elk co., Pa.; on the Clarion river and the Penn. and the Buffalo, Rochester and Pitts. railways: 118 miles S. E. of Erie, and 156 miles N. E. of Pittsburgh (for location, see map of Pennsylvania, ref. 8-D). It is in a lumbering region, and contains tanneries, foundry, machine-shop, a private bank, and two weekly newspapers. Pop. (1880) 1,100; (1890) 1,903.

**Ridgway, ROBERT**: ornithologist; b. at Mt. Carmel, Ill., July 2, 1850; educated in the common schools of that place. He was appointed zoölogist to the U. S. geological exploration of the 40th parallel, under Clarence King (1867-69), and was curator of the department of birds of the U. S. National Museum. He assisted Prof. Baird in the preparation of the technical portion of the *History of North American Birds* (1871-74). The three volumes were upon land-birds, and in 1884 two more volumes, upon water-birds, were issued. Although published as the works of Baird, Brewer, and Ridgway, the technical parts were entirely written by Ridgway. He is also author of *Report on Ornithology of the 40th Parallel*, an elaborate treatise on 262 species, and a work of 367 Government quarto pages; *A Nomenclature of Colors for Naturalists* (Boston, 1886); and *A Manual of North American Birds* (Philadelphia, 1887). Besides this, he is author of about 200 separate papers, some of considerable extent. Revised by F. A. LUCAS.

**Ridley, NICHOLAS, D. D.**: bishop and martyr; b. at Unthank, Northumberland, England, about 1500; educated in the grammar school at Newcastle-upon-Tyne; graduated at Cambridge, 1522; obtained a fellowship at Pembroke College and was ordained priest 1524; studied theology at the Sorbonne, Paris, and at the University of Louvain 1527-29; became on his return to Cambridge under-treasurer to the university, and soon afterward senior proctor (1533) and public orator, in which capacities he protested against the usurpations of ecclesiastical jurisdiction by the papacy, procuring a decree of the university to the same effect; was appointed domestic chaplain to Archbishop Cranmer 1537, vicar of Herne, Kent, 1538, master of Pembroke College and chaplain to the king 1540; was accused of heresy, at the instigation of Bishop Gardiner, on account of having preached against the Six Articles, but acquitted by Cranmer 1541; became prebendary of Westminster 1545, Bishop of Rochester Aug. 14, 1547; bore an important part in all the ecclesiastical measures of the reign of Edward VI.; assisted Cranmer in compiling the Liturgy (1548) and framing the forty-one Articles of Religion; induced the king to change Greyfriars and St. Bartholomew's priories into charitable institutions; converted his own house at Bridewell into a workhouse; was instrumental in founding Christ's, St. Thomas's, and Bethlehem Hospitals in London; was a member of the commission which deposed Bonner, and was his successor as Bishop of London Apr., 1550; aided in the deposition of Gardiner, Bishop of Winchester; visited the Princess Mary at Hunsdon, desiring to gain her acquiescence in his views of Church reform, but was unsuccessful, 1552; concurred in the proclamation of Lady Jane Grey as queen, and was induced by the Duke of Northumberland to preach a sermon at Paul's Cross in defense of her title July 16, 1553; was committed to the Tower on the accession of Mary a few days later; was taken to Oxford Apr., 1554, to participate in a discussion with the court theologians on the Real Presence; was formally tried for heresy with Cranmer and Latimer by a commission named by Cardinal Pole, and condemned to death as an obstinate heretic Oct. 1, 1555, and, having refused to recant, was burned at the stake with Latimer in front of Baliol College, Oxford, Oct. 16, 1555. His *Life* was published by his descendant, Dr. Gloucester Ridley (1763), and his *Works*, chiefly tracts in favor of the Reformation, were edited, with a *Life*, by Rev. Henry Christmas for the Parker Society (London, 1841). Revised by S. M. JACKSON.

**Ridolfo, ZENO**: See SCHADOW, RUDOLPH.

**Ridpath, JOHN CLARK, A. M., LL. D.**: historian and educator; b. in Putnam co., Ind., Apr. 26, 1840; educated at Indiana Asbury (now De Pauw) University; has served as principal of Thorntown Academy, superintendent of Lawrenceburg schools, Professor of English Literature, Professor of Belles-lettres and History, and vice-president of De Pauw University. He has published *Academic History of the United States* (1875); *Grammar School History of the United States* (1876); *Popular History of the United States* (1877); *Inductive Grammar of the English Language* (1879); *Life and Work of Garfield*, in English and German (1881); *History of the World* (3 vols., 1885; rev.

ed. 4 vols., 1889); *Life of Washington Charles De Pauw* (1887); *Christopher Columbus: the Epoch, the Man, and the Work* (1890); *Columbia: a Quadracentennial Story* (1891); *Great Races of Mankind* (3 vols., 1892); *Epic of Life*, a poem (1894); and many monographs. A. OSBORN.

**Rie'desel, FRIEDRICH ADOLPH, Baron von**: soldier; b. at Lauterbach, Hesse, June 3, 1738; studied at the College of Marburg; was an officer of a Hessian regiment in the British service during the Seven Years' war, distinguishing himself at the battle of Minden. In 1776 he was sent to America in command of the division of 4,000 Brunswickers hired by Great Britain. Arriving at Quebec, he spent a year in Canada exercising his troops in the Indian methods of warfare; joined Burgoyne in his campaign against Albany 1777; surrendered with Burgoyne Oct. 17, and was held a prisoner for over two years. After his exchange he was placed by Sir Henry Clinton in command of Long Island; was transferred to Canada, and returned to Germany, Aug., 1783. D. at Brunswick, Jan. 6, 1800. His *Memoirs, Letters, and Journals*, edited by Max von Elkelng, were translated by William L. Stone (2 vols., Albany, 1868).—His wife, FRIEDRIKE CHARLOTTE LUISE (1746-1808), wrote an interesting series of letters descriptive of life in Canada, of the incidents of Burgoyne's campaign, and of her residence as a prisoner at Cambridge and elsewhere. They were translated by William L. Stone, and published under the title of *Letters and Journals relating to the War of the American Revolution* (Albany, 1867).

**Riehl, ALOIS**: philosopher; b. at Bozen, Tyrol, Apr. 27, 1844; educated in Vienna, Munich, and Gratz universities; became Professor of Philosophy at Gratz 1873, and at Freiburg in 1883. He has published *Der philosophische Kriticismus und seine Bedeutung für die positive Wissenschaft* (Leipzig and Tübingen, 1876-87; *Ueber wissenschaftliche und nicht wissenschaftliche Philosophie* (Freiburg im Breisgau, 1883); *Beiträge zur Logik* (Leipzig, 1892). J. M. B.

**Riehl, WILHELM HEINRICH**: historian and novelist; b. at Biberich on the Rhine, May 6, 1823; studied theology at Marburg, Göttingen, and Giessen; was for a number of years editor of various newspapers, and was finally appointed Professor of Kulturgeschichte at the University of Munich. He is the author of a number of excellent historical and ethnological works, the most prominent of which are *Naturgeschichte des Volks als Grundlage einer deutschen Nationalpolitik* (1851-69); *Die Pfälzer* (1857); *Kulturstudien aus drei Jahrhunderten* (1859). His historical and ethnological studies also form the basis of a series of well-written stories and novels, of which he is the author. JULIUS GOEBEL.

**Rienzi, or Rienzo, COLA, di**: political reformer; b. in Rome about 1313; the son of a tavern-keeper; was an enthusiastic student of the old Latin poets and historians, and early conceived the purpose of restoring the ancient greatness of Rome. The city was in a condition of anarchy, distracted by the feuds among the lords and violence and cruelties against the people. One of the nobles assassinated Rienzi's brother, and the impossibility of bringing the murderer to punishment gave his visions at once a practical bearing; from a dreamer he became a reformer. After a vain attempt to induce the pope at Avignon to return to Rome and protect the people against the oppression of the nobles, Rienzi began the work of reform himself, well knowing that he could not carry it through without a revolution. On May 19, 1347, he proposed the establishment of a better form of government, recalling to the minds of his hearers the greatness of the ancient republic. Proclaimed tribune of the "holy Roman republic," he straightway forced the nobles to render him allegiance, and restored order in the city. Successful were his reforms that not only other Italian cities, but foreign monarchs, sent deputations and embassies to congratulate the tribune; but not content with restoring order and peace to Rome, he now seemed to aim at universal empire. The foreign princes were disgusted and offended at his arrogance. The Roman populace grew tired of his magnificent processions and of his taxes. The papal legates declared him a traitor and a heretic, and the nobles taking advantage of the general discontent, attacked him in Dec., 1347, and drove him from the city seven months after his accession to power. After two years of retirement among the Franciscan monks in Southern Italy, he again appeared in the rôle of a political reformer at the court of the Emperor Charles IV., who sent him as a prisoner to the pope at Avignon. Innocent VI., however, the successor of Clement IV., thought that Rienzi could be used to restore

latter are laid out in broad streets with modern buildings. Among the public buildings the most notable are St. Peter's church, built in 1406, with a tower 460 feet high; the governor's residence, formerly the palace of the grand-master of the order of the Knights of the Sword, built 1494-1515; the city-hall, and the new exchange. There are manufactories of cotton, woolen, linen, and iron goods, cigars, corks, spirits, oil, glass, paper, jute, etc., and the ship-building industry is very flourishing. Riga derives its greatest importance, however, from its commerce. An average of 2,400 vessels, of over 1,000,000 tons, enter its harbor annually. The value of its annual imports—comprising coal, salt, iron, steel, dyewoods, fish and wine, etc.—averages about 22,000,000 rubles, and that of its exports—comprising flax, hemp, timber, grain, hides, oilcake, camel and horse hair, and mineral oil—averages about 55,000,000 rubles. The city was founded in the beginning of the thirteenth century by Albert von Apeldern, Bishop of Livonia. He established the order of the Knights of the Sword, which within a few years was united to the order of the Teutonic Knights. The prosperity of Riga began when it became a member of the Hanseatic League under the protectorate of Poland. It was taken by Gustavus Adolphus in 1621, and incorporated with Russia in 1710. Nearly half the inhabitants are Germans and German-speaking Jews, the remainder being about equally divided between Russians and Letts. Pop. (1890) 180,278. R. A. ROBERTS.

**Riga, Gulf of:** an inlet of the Baltic, 100 miles long, 80 miles broad, bounded by the Russian governments of Kurland, Livonia, and Esthonia. It receives the Dwina. Oesel is a large island at its entrance.

**Rigdon, SIDNEY:** Mormon elder; b. in St. Clair township, Allegheny co., Pa., Feb. 19, 1793; received a fair English education, and was working as a printer at Pittsburg when about 1812 a manuscript was offered for publication by an eccentric preacher named Solomon Spaulding. It was entitled *The Manuscript Found, or The Book of Mormon*, and pleased Rigdon so much that he made a copy before it was returned to Spaulding, who died soon after. In 1819 Rigdon became a Baptist preacher; about 1821 a Disciple minister; and though at first professing orthodoxy, soon began to propagate singular doctrines connected with the manuscript in question. In 1829 he became acquainted with Joseph Smith, and with him devised the publication of *The Book of Mormon* as the basis of a new sect. He accompanied Smith to Kirtland, O., to Missouri, and to Nauvoo, where he was one of the presidents of the Church; was one of the originators of the "new revelation" permitting polygamy; was twice tarred and feathered, several times imprisoned, and was a candidate for the succession to the leadership on the death of Smith. On the election of Brigham Young (1844) Rigdon refused to acknowledge his authority, was excommunicated, returned to Pittsburg, Pa., and lived in obscurity; later removed to Friendship, N. Y., where he died July 14, 1876.

**Rigg, JAMES HARRISON, D. D.:** minister and educator; b. at Newcastle-on-Tyne, England, Jan. 16, 1821; educated at the Old Kingswood School; entered the Wesleyan Methodist ministry in 1845; appointed principal of Westminster Training College for Schoolmasters 1868; president of the Wesleyan Methodist Conference 1878-79, and for the second time in 1892-93; member of royal commission of national education in England 1886-88; on the staff of *The Quarterly Review* from the first (1853); one of the editors for many years, and sole editor since 1885. He has published *Principles of Wesleyan Methodism* (London, 1850); *Congregationalism and Connexionalism Contrasted* (1852); *Modern Anglican Theology* (1857; 3d ed. enlarged, with *Memoir of Kingsley*, 1879); *Essays for the Times on Social and Ecclesiastical Subjects* (1866); *The Sabbath and the Sabbath Law before and after Christ* (1869); *The Living Wesley* (1875; new ed., enlarged as *Centenary Life of Wesley*, 1891); *Churchmanship of John Wesley* (1878); *The Connexional Economy of Wesleyan Methodism* (1879); and important pamphlets on ecclesiastical and educational topics. A. OSBORN.

**Riggs, ELIAS, D. D., LL. D.:** missionary and linguist; b. at New Providence, N. J., Nov. 10, 1810; graduated at Amherst College 1829 and at Andover Theological Seminary 1832. He was in Athens, Greece, 1832-34, in Argos 1834-38, in Smyrna 1838-53, and from 1853 in Constantinople, except in 1857-58, when he taught Hebrew and the cognate languages in Union Theological Seminary, New York. He translated the Bible into Bulgarian, Armenian,

and Turkish, and published *A Manual of the Chaldee Language* (1832; 2d ed. 1858); *Grammar of the Modern Armenian Language* (1847); *Vocabulary of Words used in Modern Armenian, but not found in the Ancient Armenian Lexicons* (1847); *Notes on the Grammar of the Bulgarian Language* (1847); *Outline of a Grammar of the Turkish Language as written in the Armenian Character* (1856); *Suggested Emendations of the Authorized English Version* (1873); *Notes on Difficult Passages of the New Testament* (1889), and other writings. Revised by BENJ. I. WHEELER.

**Riggs, JAMES STEVENSON, D. D.:** minister and New Testament scholar; b. in New York, July 16, 1853; graduated at the College of New Jersey in 1874; spent two years at Leipzig and Tübingen; graduated at Auburn Theological Seminary in 1880. After a pastorate of four years in Fulton, N. Y., he became Professor of Biblical Greek in Auburn Theological Seminary 1884-92; from 1892 has been Professor of Biblical Criticism and the New Testament. He is the author of many articles and pamphlets, and of *The Bible in Art* (1895). W. J. B.

**Right Ascension:** in astronomy, the angular distance between the first point of ARIES (*q. v.*) and the point in which the circle, passing through a heavenly body and the poles of the heavens, intersects the celestial equator. It is always measured from W. to E., and corresponds to longitude on the earth, as DECLINATION (*q. v.*) corresponds to latitude. The right ascension of a heavenly body is ascertained by a transit instrument and a clock. These determine the meridian passage and the time at which it takes place, respectively. Right ascension is usually expressed in time, one hour corresponding to 15° on the celestial sphere. R. A. ROBERTS.

**Rights:** See JURISPRUDENCE, POLITICAL SCIENCE, and JUSTICE.

**Rights, Bill of:** See BILL OF RIGHTS.

**Rigi, or Righi, ree'gee:** a mountain of Switzerland, in the canton of Schwytz. It is isolated between the lakes of Zug and Lucerne, and rises 5,902 feet above the sea, 4,500 feet above the lake. Several carriage-roads and two railways lead from the base of the mountain to the top, which offers a very extensive view.

**Rigor Mortis** [Lat., rigor or stiffness of death; cf. *rigere*, be stiff]: the condition of muscular rigidity developing shortly after the death of the body. It is due to suspended nutrition of the tissues, and begins when their response to artificial irritation and electricity ceases. Rigor mortis develops at a variable period after death, and when established lasts a variable time. In persons who die suddenly, as by accident or by heart disease, and in whom the muscles are well developed and nourished, rigor mortis may be postponed for many hours—twelve or twenty-four—and may then persist for two or three days. Conversely, when death is the result of exhaustive disease, the blood is impoverished and the muscles are wasted and flabby, rigor mortis develops speedily—within an hour, or even a few minutes—and is incomplete and of brief duration. As soon as rigor mortis passes off, the relaxed body begins to decompose. Rigor mortis was formerly explained as a state of contraction, the death-act of the muscular fiber. It is now believed to be due to the separation and coagulation of the albuminoid substance in the fluid of the muscle, following the cessation of nutrition. Revised by W. PEPPER.

**Rigveda:** See VEDA.

**Riley, CHARLES VALENTINE, M. A., Ph. D.:** entomologist; b. in London, England, Sept. 18, 1843; studied at college, Dieppe, France, 1854-57, and Bonn, Prussia, 1857-59; removed to U. S. 1860; studied practical agriculture 1860-63; connected with *The Evening Journal and Prairie Farmer* at Chicago 1863-68; appointed State entomologist of Missouri 1868, in which year he began, with Benjamin D. Walsh, State entomologist of Illinois, the publication of *The American Entomologist*; president of the Academy of Science of St. Louis 1876-77; appointed chief of the U. S. entomological commission (with Dr. Alpheus S. Packard, Jr., and Prof. Cyrus Thomas) under the Interior Department 1877; U. S. entomologist under the Department of Agriculture 1878; curator of insects U. S. National Museum 1881; general secretary American Association for the Advancement of Science 1881. He has published nine annual reports on the insects of Missouri (1868-77) and three annual reports as U. S. entomologist. He is also the author of *The Locust Plague in the United States* and of *Potato Pests*, and of

and other important centers belonging to Christianity. The first missionaries arrived in 1533 when a small contingent of Spanish missionaries, including Fray Juan de San Pablo, came to the island. The first mission station was established in 1534 at the present site of the National Museum, Washington, D.C. The first mission station of the Society of Jesus was established in 1535 at the present site of the National Museum, Washington, D.C.

**Blay Island.** Water area: 1,000 sq. ft. at low tide, but at high tide it is 1,500 sq. ft. The island is a small, low-lying, sandy island, with a few small trees and shrubs. It is located in the Pacific Ocean, about 100 miles from the coast of the United States. The island is named after the first mission station established there in 1535. The island is a small, low-lying, sandy island, with a few small trees and shrubs. It is located in the Pacific Ocean, about 100 miles from the coast of the United States.

find a nidus in the hair-follicles and excite secondary inflammation of the skin. Ringworm is contagious, not only from person to person by close contact, but in the uncleanly is transplanted from spot to spot on the head and hands or wrists. The treatment is by parasitocides, or remedies destructive to parasitic life; local application of tincture of iodine, iodine and ammonia, sulphurous acid, sulphur dry or in ointment, carbolic acid, creosote, oil of cade, mercurial ointment, oleate of mercury, solution of corrosive sublimate, and cantharidal collodion. Revised by W. PEPPER.

**Rink, HENRICH JOHANN:** naturalist; b. at Copenhagen, Denmark, Aug. 26, 1819. He took part in the Galathea expedition around the world 1845-47, and as a result published *Die nikobarischen Inseln* (1847). He held many positions in connection with Greenland, and made extensive researches in that country. In 1852 he published *Den geografiske Beskaffenhed af de danske Handelsdistrikter i Nordgrønland*; in 1866-71 he published his *Eskimoiske Eventyr og Sagn*; in 1875 *Om Grønlands Indland og Muligheden af at bereise samme*. In 1877 he published in London *Danish Greenland*, and in 1887, in Copenhagen, *The Eskimo Tribes*, with a comparative vocabulary. D. Christiania in 1894.

Revised by RASMUS B. ANDERSON.

**Riobamba, reë-ô-baam-bää:** a town of Ecuador; 103 miles S. S. W. of Quito; on a plain between the Chimborazo and Altar Mountains, 9,100 feet above the sea (see map of South America, ref. 8-B). It was an ancient Indian town, and important during the conquest. On Feb. 4, 1797, it was completely destroyed by an earthquake in which over 20,000 persons are said to have perished. The new town is badly built and has little importance except as a station on the road from Quito to Guayaquil. Pop. 12,000. H. H. S.

**Rio Branco:** See RIO NEGRO.

**Rio Bravo:** the RIO GRANDE (q. v.).

**Rio Cuarto, reë-ô-kwaar-tô** (formerly *Concepcion*): a town of the province of Córdoba, Argentine Republic; on the Rio Cuarto, 112 miles S. of Córdoba (see map of South America, ref. 8-D). Until 1874 it was a frontier post, exposed to Indian attacks; it is growing rapidly, and is the second town of the province in population, an important railway center, and the emporium of a rich grazing district. Pop. (1892) 14,000. H. H. S.

**Rio de Janeiro, Portug. pron. reë-ô-dã-zhã-nã-i-rô** [Portug., river of January, a name given to the bay, then supposed to be a river's mouth, because it was discovered on Jan. 1]: a maritime state of Brazil, bordering on São Paulo, Minas Geraes, and Espírito Santo, and inclosing the Município Neutro or federal district. Area (excluding the Município Neutro), 26,634 sq. miles. It includes the mountainous districts of the Coast Range and part of the valley of the Parahyba river, with lowlands near the mouth of the latter containing the Lagoa Feia (see FEIA); there are also lowlands and lagoons along the coast. Rio de Janeiro is one of the great coffee-producing states, and sugar-cane and rice are raised on the lowlands. Most of the trade is through the port of Rio de Janeiro. The manufactures are considerable. Up to 1894 the capital was Niteroy; it is now Petropolis. Pop. (1894) estimated, 1,390,398. H. H. S.

**Rio de Janeiro:** capital and most important port of Brazil, and the largest city of South America; on the west side of the bay of Rio de Janeiro; lat. (of the observatory) 22° 54' 24" S., lon. 43° 10' 21" W. (see map of South America, ref. 7-G). The bay is perhaps the most magnificent harbor in the world. The entrance, between high rocks, is about a mile wide and perfectly clear; within, it expands into a broad sheet with many bays, stretching inland for 17 miles, the whole surrounded by strangely formed mountains and hills, with the needle-like pinnacles of the Serra dos Orgãos at the northern end. Most ships can be loaded directly at the fine docks. The city occupies flat land and hills partly surrounding a group of wooded mountains. The older streets are narrow and often crooked, with few pretentious buildings; the newer ones, farther back from the bay, are wide and lined with substantial houses. The business center, from which street-cars run to the outskirts, is the narrow Rua do Ouvidor; it is lined with retail shops, *cafés*, etc., and is a favorite afternoon promenade; no carriages are allowed on it. The finest dwellings, surrounded by gardens, are in the outskirts and on the hills; the beauty of the scenery in these outskirts elicits the admiration of every tourist; Botofogo, for example, lies between the mountains and a placid arm of the bay, with the Sugar Loaf rock, 1,200 feet high, be-

fore it. There are several public parks, including the beautiful Passeo Publico, and the Botanical Garden in the suburbs. The handsomest church and the most richly decorated building in South America is the Candelaria. The old monasteries are now used for public buildings, and have been supplemented by handsome modern structures, such as those of the Department of Agriculture, the national printing-office, and the mint. There are several hospitals, and that called Mizericordia is said to be the largest and most richly endowed in the world. There is a well-appointed observatory; a national library, the largest and most valuable in South America, besides several other libraries; polytechnic school, national college, schools of medicine, fine arts, etc., and a naval school. The museum occupies the old imperial palace, an unpretentious building, but surrounded by a beautiful park; the collections in some branches are very valuable. The bay is defended by several forts, and there is an extensive navy-yard. The Corcovado Mountain, about 2,500 feet high, has precipitous sides looking down on the streets; a mountain-railway runs to a hotel on the summit. Other beautiful resorts are the high valley of Tijuca, and Niteroy, on the other side of the bay.

Rio de Janeiro has a large foreign element, and much of the trade is in the hands of foreign merchants. The commerce is very important. Rio exports more than half of the total coffee product of the world, or some 400,000,000 lb. annually; the crop is brought in by railways. The largest exports, especially of coffee, are to the U. S.; most of the imports are from Europe. Regular steamers run to the U. S., Europe, the western coast of South America, New Zealand, etc. The climate is warm from May to October, temperate during the rest of the year, and always damp and somewhat changeable; lung diseases are consequently prevalent. Notwithstanding good drainage and modern sanitary improvements, yellow fever is generally prevalent during the warm months, and at intervals there are severe epidemics. A good but somewhat inadequate water-supply is obtained by fine aqueducts from the Corcovado and Tijuca. The bay was discovered (probably) by João Manoel and Amerigo Vespucci Jan. 1, 1502. French Protestants tried to form a settlement on it, but were driven out in 1567 by the Portuguese, who then founded São Sebastião, or Rio de Janeiro. It became the capital of Southern Brazil in 1762, and of the whole of Brazil in 1774. From 1808 to 1821 it was the residence of the Portuguese court, and hence the capital of Portugal. The revolution of 1889 broke out here; during the naval rebellion of 1893-94 the city was bombarded, but not seriously injured. Population of the city proper (1893) about 300,000. The Município Neutro, which includes the city, is a federal reservation, similar in character and government to the District of Columbia in the U. S.; area, 538 sq. miles; estimated population, with the city (1893), 471,775. See Valle Cabral, *Guia do Viajante no Rio de Janeiro* (1884); Agassiz, *A Journey in Brazil* (1868). HERBERT H. SMITH.

**Rio de la Plata:** See PLATA, RIO DE LA.

**Rio de Oro:** a bay (mistaken by an early explorer for a river) lying between the African mainland and the Ed-Dajla peninsula, on the Atlantic coast, N. of the Tropic of Cancer. It is in Spanish territory, and the Spaniards have establishments there devoted chiefly to fishing. The Spanish possessions on this Saharan coast extend (since 1884) from Cape Bojador to Cape Blanco, and part of the region inland consists of the oases of Adrar, where grain is raised to some extent, and many sheep, goats, camels, horses, and cattle graze. The chief town of Adrar is Shingeti, and 30,000 people live there. C. C. ADAMS.

**Rio Grande, or Rio Grande del Norte, reë-ô-graan dâ-dâ-l-nôr-tâ** [Span., great river of the north]: a large river which rises in Southwestern Colorado, flows first E. and then S. through New Mexico, flows thence S. E., forming for several hundred miles the boundary between the U. S. and Mexico, and falls into the Gulf of Mexico after a course of about 1,800 miles. It is navigable for small boats only for about 450 miles, or to Kingsbury Rapids; is generally shallow, frequently interrupted by rocks and cataracts, and is subject to periodical inundations near its mouth. Its principal tributary is the Rio Pecos. Brownsville, Tex., and Matamoras, Mexico, are situated on opposite sides of the Rio Grande, 35 miles above its mouth.

**Rio Grande do Belmonte:** See JEQUITINHONHA.

**Rio Grande do Norte:** an eastern maritime state of Brazil, between Ceará and Parahyba, with a coast including

their assembling to do any unlawful act. For example, if having gathered in front of a theater without preconcerted design to commit a breach of the peace, they attempt to force their way into the building and attack the police who are guarding the doors and rescue those who are arrested, they are rioters. (*People vs. Judson*, 11 Daly 1.) Nor is it necessary that they intend to terrify others. They may intend to engage in a mere frolic, as in a charivari or "horning" of a householder, or in entering the stable of another and shaving his horse's tail; yet if this is done in a tumultuous and terrifying manner the enterprise is a riot. *State vs. Alexander*, 7 Richardson (S. C.), 5.

An *unlawful assembly* is the meeting of three or more persons with a riotous purpose. If they enter upon the execution of that purpose, yet fall short of an act amounting to a riot, their offense is a *riot*. Modern legislation has modified the common-law rules governing these three offenses.

FRANCIS M. BUEDECK.

**Riouw-Lingga**, *reë-ow'ling-gaa*: an archipelago of the China Sea, making an extension of the Malay Peninsula; belonging to the Dutch and forming part of the residency of Riouw. It is formed of two groups of islands, that of Riouw being the northern and adjacent to Singapore, and Lingga the southern. The Riouw group consists of about thirty islands, the largest of which is Bintang with an area of about 400 sq. miles. The Lingga group is separated from the preceding by the Strait of Dempo, 10 miles broad. It consists of two large islands—Lingga (area, 320 sq. miles) and Singkep (area, 204 sq. miles)—and many smaller ones. The area of the whole archipelago is estimated at 1,823 sq. miles. The islands are rocky, like the peninsula rather than the adjacent alluvial shores of Sumatra. The highest peak is that of Lingga, 3,711 feet high. The islands are covered with thick and valuable forests. Among the productions are sago, rice, pepper, and gambir, the last forming the principal export. Tin has long been mined. The aborigines are Indonesian and negro, and have nearly disappeared. The inhabitants are now mainly Malays, Chinese, Klings, and Javanese, with a few Europeans. Pop. about 80,000.

MARK W. HARRINGTON.

**Riparian Rights** [*riparian* is from Lat. *riparius*, deriv. of *ripa*, the bank of a stream]: strictly speaking, such rights as appertain to the ownership of land upon the banks of rivers and other natural water-courses. Thus defined, the expression would include the rights enjoyed by riparian proprietors over the public streams by which their lands are bounded (such as the right of access, of wharfage, of ferryage, etc.), as well as those mutually exclusive rights of user in the private streams, whose beds are the property of the adjoining owners.

The expression is sometimes, however, more loosely and with less propriety used to describe all of the rights, whether of the public or of adjoining owners, which the law recognizes in any public or private waters. As thus employed it would comprehend the public right of navigation on the sea or on navigable streams, as well as the mutual rights of the abutting "littoral" proprietor and the public in the sea-shore.

For these several classes of rights, see LAKES, RIVERS, and SEASHORE. See also FILUM AQUÆ and WATERCOURSES, and consult the following authorities: Angell on *Tidewaters* and on *Watercourses*; Hall on *The Seashore*; Gould on *Waters*; and Pomeroy on *Riparian Rights*. G. W. KIRCHWEY.

**Ripley**: village; Brown co., O.; on the Ohio river and the Chesapeake and Ohio Railway; 50 miles S. S. E. of Cincinnati (for location, see map of Ohio, ref. 8-D). It occupies a site between the river and a steep bluff, is in a noted "white burley" tobacco-growing region, has a large river commerce, and contains flour and saw mills, piano and shoe factories, leaf-tobacco packing-houses, 2 national banks with combined capital of \$200,000, and 2 weekly newspapers. Pop. (1880) 2,546; (1890) 2,483; (1894) estimated, 5,000.

EDITOR OF "BEE."

**Ripley**, ELEAZER WHELOCK: soldier; b. at Hanover, N. H., Apr. 15, 1782; a nephew of President John Wheelock and a son of Sylvanus Ripley, D. D., Professor of Divinity at Dartmouth (d. Feb. 5, 1787); graduated at Dartmouth College 1800; practiced law in Maine, residing chiefly at Portland; was a member of the Massachusetts Legislature 1810-11; Speaker and elected State Senator 1812; was appointed colonel of the Twenty-first Infantry 1813; was wounded in the attack upon York (now Toronto), Canada, Apr. 24, 1813; became brigadier-general Apr. 14, 1814; commanded

the Second Brigade under Gen. Brown on the Niagara frontier; took part in the battles of Chippewa and Niagara, being severely wounded in the latter, in which he won the brevet rank of major-general; was conspicuous for gallantry in the defense of Fort Erie Aug. 15, and in the sortie of Sept. 17; received a gold medal from Congress; resigned from the army 1820; settled in Louisiana, where he practiced law; served in the State Senate, and was a member of Congress, 1835-39. D. at West Feliciana, La., Mar. 2, 1839.

**Ripley**, GEORGE: critic and journalist; b. at Greenfield, Mass., Oct. 3, 1802; graduated at Harvard 1823, and at Cambridge Divinity School 1826; was pastor of a Unitarian church in Boston 1826-41; resided several years in Europe, where he made a careful study of French and German literature; wrote *Discourses on the Philosophy of Religion* (1839); *Letters to Andrews Norton on the Latest Form of Infidelity* (1840); and edited *Specimens of Foreign Standard Literature* (14 vols., Boston, 1838-42); was associated with Emerson and Margaret Fuller in conducting *The Dial* 1840-41; contributed to *The Christian Examiner* and other magazines; was the chief promoter of the celebrated socialistic experiment at Brook Farm, Roxbury, Mass., 1841-47; was one of the editors of *The Harbinger*, a Fourierite organ, 1844-48; removed to New York 1847; became literary editor of *The New York Tribune* 1849, and remained so until his death; published (with Bayard Taylor) *A Handbook of Literature and the Fine Arts* (1852), and edited (with Charles A. Dana) *The American Cyclopædia* (New York, 16 vols., 1858-63), which was revised (Dr. Ripley, editor-in-chief, and appeared 1873-76. D. in New York, July 4, 1880. See his *Life*, by O. B. Frothingham (Boston, 1882).

Revised by H. A. BEERS.

**Ripon**: town; in Yorkshire, England; on the Ure; 23 miles N. W. of York (see map of England, ref. 6-1). The cathedral was originally founded on the ruins of St. Wilfrid's Abbey about 680, but of this building the crypt only remains. The present structure was begun in the twelfth century, and was entirely restored by Sir Gilbert Scott (1862-76). Its chief interest is from its various styles of architecture. Ripon has been the seat of a bishopric since 1836. There are several tanneries and foundries. Pop. (1891) 7,512.

**Ripon**: city; Fond du Lac co., Wis.; on the inlet of Green Lake, and the Chi., Mil. and St. P. and the Chi. and N. W. railways; 20 miles W. by N. of Fond du Lac, 86 miles N. W. of Milwaukee (for location, see map of Wisconsin, ref. 6-E). It is in an agricultural, dairying, and stock-raising region; has good water-power and water and sewerage systems; and contains Ripon College, 9 churches, a public library, 2 national banks with combined capital of \$110,000, a monthly and 2 weekly periodicals, 2 flour and feed mills, several creameries, knitting-factory, pickle-works, and box and crate factory. Pop. (1880) 3,117; (1890) 3,358; 1894) estimated, 5,000. EDITOR OF "COMMONWEALTH."

**Ripon**, GEORGE FREDERICK SAMUEL ROBINSON, Marquis of: statesman; b. in London, England, Oct. 24, 1827; became *attaché* to the British legation at Brussels 1849; sat in Parliament from 1852 until he succeeded his father as Earl of Ripon and Viscount Goderich, Jan. 28, 1859; inherited the earldom of De Grey on the death of an uncle Nov. 14, 1859; became in the same year Under-Secretary for War, and in Feb., 1861, Under-Secretary for India; became Secretary for War, with a seat in the cabinet, Apr., 1863; was made Secretary of State for India Feb., 1866, and lord president of the council Dec., 1868; was chairman of the high joint commission which negotiated the Treaty of Washington 1871; was rewarded with the title of marquis on his return June 23; was installed grand-master of the Freemasons of England Apr. 23, 1870, but resigned that position Aug., 1874, and was received into the Roman Catholic Church at Brompton Sept. 4, 1874. On the return of Gladstone to power the Marquis of Ripon was appointed Viceroy of India, which office he held until 1884. His attempts to extend the rights of the natives and to curtail in some respects the privileges of the Europeans made him most unpopular with the latter. He was First Lord of the Admiralty in 1886, and was appointed Colonial Secretary in 1892.

Revised by F. M. COLBY.

**Ripon College**: an institution at Ripon, Wis., in a campus of 10 acres. It was organized in 1854, and is privately endowed for the purpose of furnishing to young men and women opportunities for obtaining an education of the high-

[illegible][illegible]

She left her native country, San Carlo, Pavia, Italy, in 1892, for the United States, and made her debut at the Metropolitan Opera House, New York, in 1893. She was a soprano, and her repertoire included such roles as Desdemona in *Othello*, and the title role in *La Traviata*. She also performed in many other operas, and was highly successful. In 1900, she married a Frenchman, and they lived in Paris for several years. She then returned to the United States, and continued her career as a soprano. She was a member of the Metropolitan Opera House, and performed there for many years. She was also a member of the Grand Opera of Paris, and performed there as well. She was a very popular singer, and her performances were highly praised. She died in 1910, in Paris, France.

Received by B. H. Vaidya 1974

called in the bar in 1888. He was a member of the committee named to revise the constitution of 1864. He represented a judicial judge of the Department until 1894. On January 1, 1894, he took judicial position in the court and appointed chief justice of New Brunswick. On 1 May 1894, he resigned his position and joined the Supreme Court. He served until 1901. He was appointed chief justice June 13, 1899. He was appointed in 1891 and was deputy attorney general of Canada from July 1891, October 1892, and again from September 1894. He was appointed secretary of the government March 1, 1894. He died in 1901.

**Ritschl, Albrecht, D. D.**—Theologian, born Berlin, Prussia, Mar. 26, 1822; studied at Bonn and Berlin; became an extraordinary professor at Bonn 1846 to 1852, and then at Göttingen and later, from Mar. 20, 1860. He became the head of a school of theology known as the *Ritschian*. He has come to occupy the same position at the University of Bonn, and has since 1877, when he published *Die Lehre und Bedeutung der Christenheit* (a critical-scientific *Kirchen- und Dogm.*, Bonn, 1869). His other principal works are *Die christliche Theologie der Christenheit* and *Lehrbuch d. Theol.* 1870-74, 2d ed. 1880; *Die eth. Lehre*, also translated into English, *A Practical History of the Christian Church as Syncretism and Discretism* (Edinburgh, 1872); *Die Theologie der Gegenwart* (1891); *Theologie und Method* (1891), 2d ed. 1900; *Die Aussagen in der christlichen Theologie* (1875), 2d ed. 1900; and 1900, *Neuherausgabe des Briefes über die Heiligung* (1874), under a number of names in the publication. His life throughout is devoted to a comparison of forms in his *Lehrbuch*. His work on *Christenheit*, etc., presents it in a novel, fuller than any existing form.

Ritschl's philosophy is a fundamental principle for Neo-Kantianism, more particularly Lorenz's theory of cognition, emphasizing the view that we know things not as they are in themselves, but as they are for us; i.e., as they are expressed in their relations. Judgments are judgments of value. He lays stress accordingly on the subjective element in personal experience—as being the ultimate fact in religion. Hence he considers the introduction of merely speculative discussions into theology. He rejects the doctrine of original sin, of the Trinity, and of the Incarnation, as being metaphysical rather than religious. He does not believe in the personal pre-existence or miraculous birth of Christ. He regards Christ, however, as having been specially called to reveal God to men, which revelation he accomplished through a faultless life of devotion to his work of establishing the kingdom of God—i.e., a community of men led by the principle of mutual love. As being the first to exemplify a perfect devotion to God's will, Christ became a mediator, or priest, to bring men to God. He called God known as being essentially love, the love being manifested especially in the free forgiveness of man's sins, no preconditions being needed as a condition. All pardonable sins are to be reckoned as sins of ignorance. All pardonable sins are to be reckoned as sins of ignorance.

Rationalistic natural theology, and makes little account of natural wonders for Christianity. The conversion of men, he believes in more rather than in faith, but in emphasizing the historical character of Christianity, and asserts that men are pardoned and saved only as they are members of the Christian community. He accordingly strongly condemns superstition and position holding that the notion of direct individual relations between man and God is essentially foreign to Christianity. While he regards the Scriptures as containing the most authentic statements

of what the original Christianity was, he adopts no strict doctrine of inspiration; and he and his school entertain very free views as to the prerogatives of biblical criticism, holding that the essential thing is faith in the person of Christ rather than in his deeds or words or in dogmatic statements about him.

The theology of Ritschl is original only in the sense of being a peculiar composite. Like Schleiermacher, he holds that the religious sense is something immediate and ultimate, and that theology is independent of all secular science. With ordinary orthodox Christians he holds that Christianity came by a divine revelation. With the rationalists he is inclined to reject the mysterious and the supernatural, and to hold loose views of the inspiration and authenticity of the Scriptures; and in spite of Ritschl's denunciation of mysticism, the difficulty of combining this latter feature with perfect assurance of faith leads him (and more especially some of his followers, as Herrmann and Kaftan) to a sort of mysticism in the exposition of the relation of the Christian to Christ.

Notwithstanding some marked divergences of doctrinal views among Ritschl's adherents (some of them, e.g., disagreeing with him respecting the pre-existence of Christ), there is among them a strong *esprit de corps*, and they work together zealously in propagating their views and in securing the appointment of men of their school for the vacant places in the theological faculties. Among the more prominent representatives of the Ritschl school are W. Herrmann, of Marburg, Th. Häring, of Göttingen, Julius Kaftan, of Berlin, and H. Wendt, of Jena (dogmaticians); A. Harnack, of Berlin, and F. Loofs, of Halle (historians); E. Schürer, of Kiel, and H. Schultz, of Göttingen (exegetes).

C. M. MEAD.

**Ritschl, Friedrich Wilhelm:** classical scholar; b. at Grossvargula, Thuringia, Apr. 6, 1806; studied under Reising at Halle; privat docent there 1829; professor 1832; at Breslau 1833; at Bonn from 1839-65, when he resigned in consequence of petty intrigues, accepting a call to Leipzig, where he died Nov. 8, 1876. Ritschl's magnetic influence as a teacher can only be compared to that of Gottfried Hermann; he may be said to have been the founder of a philological school, and many of his pupils have been called to occupy chairs in German universities. His lasting fame as a scholar rests upon his work on *Plautus*, and the epigraphical and linguistic studies of early Latin to which it gave rise. The complete edition of the comic poet was begun in 1871 with the *Trinummus*, to which are added exhaustive and justly celebrated Prolegomena, and was completed in 1894 by some of his pupils. Of his other contributions, many of which are of an epoch-making character, only a few can be here cited: *Parerga Plautina et Terentiana* (1845) contain, among other valuable treatises, the famous dissertation on the *Fabula Varroniana*; in the *Præcæ Latinitatis Monumenta Epigraphica* the author collected in 100 large folio plates artistic facsimiles of Latin inscriptions of the republican period, to which he added an exhaustive commentary. His minor writings, among which the various articles on the *Alexandrian Library* and on the *Literary Activity of Varro* are perhaps the most noteworthy, have been republished in five volumes of *Opuscula*. See L. Müller, *Friedrich W. Ritschl* (1877); Bursian, *Gesch. der class. Philol. in Deutschland*, pp. 812-840; and especially O. Ribbeck, *F. W. Ritschl, Ein Beitrag zur Gesch. der Philologie*, 2 vols., pp. 348, 591 (1879-81).

ALFRED GUDEMAN.

**Ritson, Joseph:** scholar; b. at Stockton-on-Tees, England, Oct. 2, 1752; studied law; became a conveyancer in London and deputy high bailiff of the duchy of Lancaster; devoted most of his time for many years to antiquarian researches; edited a vast number of reprints of old and rare books. D. at Hoxton, Sept. 3, 1803. Among his works were *Observations on Warton's History of English Poetry* (1782); *Ancient Songs from the Time of King Henry III. to the Revolution* (1790); *A Collection of Scottish Songs* (1794); *Robin Hood Ballads* (1795); *Bibliographia Poetica* (1802); and *Ancient English Metrical Romances, with Dissertation and Glossary* (3 vols., 1802). See his *Letters*, edited with a memoir, by Sir N. Harris Nicolas (2 vols., 1833).

Revised by H. A. BEERS.

**Rittenhouse, Benjamin:** instrument and clock maker; b. in Norriton township, (now) Montgomery co., Pa., 1740 or 1741; brother and assistant to David Rittenhouse. From Feb. 26, 1776, to Dec., 1778, the State of Pennsylvania maintained a gun-factory, of which he was superintendent.

He was representative in the Ninth, Tenth, and Twelfth General Assemblies of Pennsylvania (1784-88); commissioner to survey the Schuylkill river Oct. 20, 1789; associate judge of the court of common pleas of Montgomery co., Pa., Mar. 28, 1792, for ten or fifteen years, when he moved to Philadelphia. In 1796-97 he made a surveyor's chain, by order of Congress, which has been the standard of the U. S. Land-office ever since. He was elected a member of the American Philosophical Society Jan. 16, 1789. D. in Philadelphia, Aug. 31, 1825.

ANITA N. MCGEE.

**Rittenhouse, David, F. R. S., LL. D.:** astronomer and mathematician; b. Apr. 8, 1732, at Paper-mill Run, Roxborough township, near Germantown, Pa., where about 1690 his great-grandfather, William Rittinghuysen, a Hollander, established the first paper-mill in America. In boyhood he worked on his father's farm at Norriton, during which time he came into possession of some mathematical books; made himself master of Newton's *Principia*; discovered for himself the method of fluxions when in his nineteenth year; made a clock at a still earlier age, and undertook clock-making as a profession in 1751. He afterward made an orrery, which was purchased by Princeton College 1770, and later a larger one for the University of Pennsylvania. In connection with Mason and Dixon he was employed in 1763, to determine the initial point of their survey, which he did with instruments of his own construction; fixed the northern, southern, and western boundaries of Pennsylvania, and performed similar tasks for other States; was appointed by the American Philosophical Society to observe the transit of Venus June 3, 1769, which he did successfully in his private observatory at Norriton; calculated the elements of the (future) transit of Dec. 8, 1874; and observed the transits of Mercury of 1769 and 1782. In 1770 he settled at Philadelphia, where he continued the manufacture of clocks and mathematical instruments. He was elected to the provincial Legislature in 1776; was a member of the convention which formed the State constitution of Pennsylvania 1776; held various official positions during the Revolution; was State treasurer 1777-89; director of the U. S. mint 1792-95. In the latter year, after the death of Franklin, he became president of the American Philosophical Society, and was chosen a fellow of the Royal Society. D. in Philadelphia, June 26, 1796. His papers on astronomical, physical, and mathematical subjects are found in the first four volumes of the *Transactions* of the American Philosophical Society. A *Eulogium* upon him was delivered by Dr. Benjamin Rush 1796; his *Life* was written by his nephew, William Barton (1813), and by Prof. James Renwick in Sparks's *American Biography*, 1st series, vol. vii. (1834).

**Ritter, Carl:** geographer; b. at Quedlinburg, Prussian Saxony, Aug. 7, 1779; studied at Halle; traveled much, and was appointed Professor of Geography at the University of Berlin in 1820. By his lectures, as well as by his works, he exercised a decisive influence on the study of geography, remodeling the whole science and attracting general attention to its problems and results. D. in Berlin, Sept. 29, 1859. His principal works are *Die Erdkunde im Verhältnis zur Natur und zur Geschichte des Menschen* (1st ed. 2 vols., 1817-18; 2d ed. 19 vols., 1822-59, comprising only Africa (i.) and Asia (ii.-xix.)); *Europa, ein geographisch-historisch-statistisches Gemälde* (2 vols., 1807); *Die Stupas* (1838); *Einleitung zur allgemeinen vergleichenden Geographie und Abhandlungen zu einer mehr wissenschaftlichen Behandlung der Erdkunde* (1852). After his death were published *Geschichte der Erdkunde* (1861); *Allgemeine Erdkunde* (1862); and *Europa* (1863). Parts of his works have been translated into English by W. L. Gage: *Comparative Geography* (1865) and *The Comparative Geography of Palestine and the Sinaitic Peninsula* (4 vols., 1866). His *Life* was written by W. L. Gage (Edinburgh, 1867).

Revised by M. W. HARRINGTON.

**Ritter, Heinrich:** philosopher; b. at Zerbst, Germany, Nov. 21, 1791; studied theology and philosophy at Halle, Göttingen, and Berlin, and was appointed Professor of Philosophy at Berlin in 1824, at Kiel in 1833, at Göttingen in 1837, where he died Feb. 3, 1869. His principal work is his *Geschichte der Philosophie* (Hamburg, 12 vols., 1829-55), ending with Kant; the most prominent of his works, all relating to the history of philosophy, are *Versuch zur Verständigung über die neueste deutsche Philosophie* (1853); *Die Halbkantianer und der Pantheismus* (1827); and *Ueber Unsterblichkeit* (several times reprinted).

Canal, and on the railway from Lyons to St.-Étienne (see map of France, ref. 6-G). It is a center of iron manufacturing and has important coal mines in its neighborhood. It has also glass-factories, tanneries, and factories of articles in leather. Pop. (1891) 13,070. M. W. H.

**Rivera, reñ-vá-rá,** José Fructuoso: soldier and politician; b. at Paysandú, Uruguay, about 1790. He was a partisan leader in the civil wars, and after Uruguay became independent was the first regularly elected president 1830-35. In 1836 he revolted against his successor, Oribe, heading the Colorados party, whose long struggle with the Blancos marks the subsequent history of Uruguay. Oribe was driven out, and Rivera was again president 1838-42. Then Rosas, dictator of Buenos Ayres, aided Oribe, who began the "nine years' siege." Rivera acted against him in the field, but on Mar. 28, 1845, was defeated at India Muerta by Urquiza, Oribe's ally. In 1853 Rivera aided in the deposition of Giro at Montevideo, and became a member of the executive triumvirate. D. at Montevideo, Jan. 13, 1854. H. H. S.

**River-bullhead:** See MILLER'S THUMB.

**River Falls:** city (settled in 1851, incorporated in 1885); Peconic river, at the west end of Great Peconic Bay, and the Chi., St. P., Minn. and Omaha Railway; 12 miles S. E. of Hudson, 16 miles N. E. of Hastings, Minn. (for location, see map of Wisconsin, ref. 4-A). It is in an agricultural region; has abundant power for manufacturing from the river; and contains 6 churches, 2 public-school buildings, a high school, the Fourth Normal School of the State, gas and water-works, 2 State banks with combined capital of \$64,000, and a weekly newspaper. The principal manufactures are flour and starch. Pop. (1880) 1,499; (1890) 1,783; (1894) estimated, 2,000. EDITOR OF "JOURNAL."

**Riverhead:** town; capital of Suffolk co., N. Y.; on the Peconic river, at the west end of Great Peconic Bay, and the Long Island Railroad; 4 miles S. of Long Island Sound, 75 miles E. by N. of Brooklyn (for location, see map of New York, ref. 8-F). It contains a national bank with capital of \$50,000, a State bank with capital of \$5,000, a savings-bank, a weekly newspaper, grist, woolen, paper, planing, and moulding mills, and carriage, chocolate, organ, and soap works. Pop. (1880) 1,757; (1893) 2,017.

**River Hydraulics:** that branch of hydraulics which deals with the flow of water in rivers. The principles are also applicable in a simplified form to canals and other artificial conduits. In the early part of the seventeenth century Castelli and Torricelli, pupils of Galileo, applied the principles of that master to hydraulics. The latter discovered the law governing the issue of fluid-veins from small orifices in the sides of a reservoir, and suggested this law as applicable to the flow of rivers. Near the close of the century Guglielmini elaborated this theory, which was generally adopted by the scientific world because no one attempted to verify its consequences by actual experiment. In 1732 Pitot, by observing sub-surface changes of velocity with the tube which bears his name, overturned this school of hydraulics. Attention being thus called to the importance of a practical treatment of the problem, experiment was multiplied; and finally, in 1786, Dubuat laid the foundation of the modern school by announcing his great principle that the flow is due to gravity acting through the slope of the surface, and that the true method of enunciating in mathematical language the law of motion is to equate expressions for the accelerating and retarding forces. During the nineteenth century many investigators have attacked the problem upon this general basis, and the general laws of distribution of velocities in a cross-section of a stream have become fairly known, while many formulas for mean velocity have been proposed.

The elaborate hydraulic survey of the Mississippi river, made from 1850 to 1860 by Humphreys and Abbot, resulted in a system of river hydraulics of which the following is a brief outline: The law of distribution of velocity in both vertical and horizontal planes was shown to be parabolic. The ratio between the mid depth and mean velocity is sensibly constant, being about 0.96, and it is independent of wind effect. This last discovery has been of particular value in reducing the labor of gauging streams. In algebraic language, the most important of these laws for sub-surface velocity are expressed as follows, with  $D$ ,  $d$ , and  $d'$  denoting, respectively, the total depth, the depth of the axis, and the depth of any particular point; and  $v$ ,  $V$ ,  $V_m$ ,  $V_s$ ,  $V_{\frac{1}{2}}$ ,  $V_d$ ,  $V_m$  denoting, respectively, the mean velocity of the

river, the velocity at any depth  $d$ , the surface velocity, the velocity at the bottom of the river (the depth being  $D$ ), the velocity at half the depth, the maximum velocity, and the mean of the whole vertical curve:

$$(1) \quad b = \frac{1.69}{\sqrt{D + 1.5}}$$

$$(2) \quad V = V_d - \sqrt{bv} \left( \frac{d - d'}{D} \right)^2$$

$$(3) \quad V_m = \frac{1}{2} V_d + \frac{1}{2} V_s + \frac{d}{D} \left( \frac{1}{2} V_s - \frac{1}{2} V_d \right)$$

$$(4) \quad V_{\frac{1}{2}} = V_m + \frac{1}{2} \sqrt{bv}$$

The formula for the mean velocity deduced is the following, in English feet:  $v$  denotes the mean velocity per second;  $a$ , the area of cross-section;  $p$ , the wetted perimeter;  $W$ , the width;  $b$ , the value given in eq. (1);  $s$ , the sine of the slope corrected for bends—its numerical value is the quotient of the total fall in water-surface between the terminal stations, less the value of  $h$  in the bend formula, by the total distance between them measured on the middle line of the channel;  $N$  represents the number of angles changes each 90° of the latter line. The value of  $v$  in the bend formula is found by successive approximations.

$$(5) \quad v = \left( \sqrt{0.0081b + \left( \frac{225a\sqrt{s}}{p + W} \right)^2} - 0.09\sqrt{b} \right)^2$$

$$(6) \quad h = \frac{Nv^3}{536} \quad (\text{bend formula}).$$

Among other formulas for mean velocity that of Kutter (see HYDRAULICS) has received the widest acceptance, and as it contains a coefficient of roughness, it can be adapted to different classes of streams as well as to artificial channels.

**Gauging of Rivers.**—For practically gauging the discharge of a large river the following plan is recommended. Select a locality in a straight portion where the current is regular. Lay out a base-line 200 feet long parallel to the direction of the flow, and determine accurately the cross-section in front. Establish two theodolites, and, for numerous floats well distributed between the banks, note the angular distance from, and the time of transit past, each end of the base. These floats should be made double, the surface float being a tin ellipsoid or other light body bearing a little flag. The lower float may be a large open keg, ballasted with lead so as to hang vertically. The connecting cord should be as small as practicable. The rate of movement of the whole will thus be essentially that of the lower keg. The center of this keg should be placed at six-tenths of the depth below the surface, because in the absence of wind the velocity at that point very nearly represents the mean of the velocities in the vertical. The level of the water on a gauge should be read at regular intervals. To reduce the observations draw upon a sheet of section-paper the base-line and two perpendiculars to mark the lines across which the times of transit were noted. From the recorded angles and a table of natural tangents the paths of each float are plotted, and upon each is written the second of its transit past the base. The total width of the river is next divided into as many equal divisions as show sensibly unvarying velocity. The mean of all the seconds of transit in each division is then reduced to feet per second, and adopted as the velocity in that division. A mean of all these velocities, interpolations being made if any are missing, closely approximates to the mean velocity of the river.

Where the depth will permit, rods or tubes, loaded to float vertically, and extending from the surface nearly to the bottom, are often used, thus integrating mechanically the velocities in a vertical. For small streams various forms of meters are often employed, which consist essentially of a submerged wheel, with apparatus designed to record the number of its revolutions; and the accuracy of the result, of course, depends entirely upon the precision with which these revolutions can be translated into feet per second. Electricity has been skillfully applied to record the number of revolutions of the wheel, and thus the registering apparatus can be observed on land or in a boat.

**Oscillations.**—As the volume of water in the channel increases, the surface-level of the river rises. The amount of this rise varies greatly in different parts of the course, especially when the stream discharges into the sea or a large lake. In such cases the oscillation is insignificant near the

original constructional troughs of the country are called consequent valleys. All but the deepest of the constructional lakes are in this way drained, and the flow of the streams becomes more continuous. The river now enters well on its life-work of carrying along the waste of the land on its way to the sea, the waste being received partly from the cutting of the stream channels, partly from the creeping and washing of the soil from the steep sides of the young consequent valleys, and partly from the broad constructional slopes of the region. Whenever, during the process of channel cutting, the streams pass from a resistant to a weak rock structure, an increase of slope is developed at the point of contrast, forming rapids; where the contrast of resistance is well marked, the increase of slope may be abrupt, and thus many waterfalls may come to characterize youthful streams. See CATARACTS.

*Adolescent Rivers.*—A river of good size soon cuts down its valley close to sea-level, or base-level, as it is now generally called, and on thus assuming a gently sloping course it enters its adolescence; but its small side-streams may still retain youthful features. Adolescence of the trunk stream is therefore characterized not only by the disappearance of the initial constructional lakes, but also by the wearing away or recession of the youthful waterfalls, and the attainment of a slope on which the ability of the river to do work is just equal to the work that it has to do. The river course is then said to be graded. Large streams may attain a graded course on weak rocks during the youth of their system; small branches on resistant rocks will not grade their courses until after adolescence. The depth of an adolescent valley depends on several factors: First, the height of the land in which the valley is cut; the rivers of low-lying Florida are unable to cut deep valleys, because their drainage area is hardly above base-level; while the COLORADO RIVER (*q. v.*) is cutting down a vast cañon, because the plateaus across which its course is laid have been lifted so high; it still has rapids and falls, and is only entering adolescence. Second, the depth depends on how close the channel may approach base-level; this depends on the grade that the river may assume, and this in turn depends on the volume and load of the stream—for example, in a region of given height a large river will cut down a deeper consequent valley and assume a gentler grade than a small river; for the large one can carry its load on a faint slope, while the small one will need a steeper slope on which to gain velocity with which to do its work; for this reason a graded river descends more rapidly in its upper course, where the volume is small, than in its lower course, where its volume is greater. Again, in two river basins of similar area and structure, but one in a dry and the other in a wet climate, the river in the first can not in its adolescence cut down so deep a valley as the river in the second; for the volumes of the two rivers must differ. Still again, of two rivers of equal size, one trenching a region of hard rocks, the other at work in a region of similar form and height but of weak rocks, the former will cut a deeper adolescent valley than the latter, because the former will have but a moderate load of land-waste, while the latter will be surcharged with detritus from the easily weathered rocks of its basin, and will need a comparatively steep grade on which to do its work. It is for two of these reasons, the dryness of the climate and the weakness of the rocks, that the rivers of the U. S. which cross the elevated western plains from the Rocky Mountains eastward have not cut deeply entrenched valleys; they are characteristic adolescent rivers with well-graded courses, but the land-waste from the weak rocks of the plains is shed into them so rapidly, and their volume is so reduced by the small rainfall, that they have practically ceased deepening their valleys, while their slope is still comparatively steep and their channels are still high above base-level. Other illustrations of the control of grade by load are found in those rivers which run from the Alps out upon the plains of Lombardy. Some of them pass through lakes on the way, and are there filtered of their load from the mountains; then below the lakes they cut down the plain that they traverse, while others emerge from the mountains well charged with detritus and are unable to trench the plain; they may even build it up by depositing some of their load upon it.

*Subsequent Rivers.*—While the trunk river is grading its valley and the consequent lateral streams are advancing toward the graded condition as fast as they can, certain new branches, not represented in the original constructional river system, make their appearance. These are developed

at various points, but especially wherever the walls of a consequent valley expose a weak stratum or rock-mass; for as the consequent valley widens by the wasting of its side-slopes, the widening will be fastest where the slopes consist of weak rocks; and thus in time numerous lateral ravines will be developed, lengthening headwards into valleys along the lead of the weak rocks by which they are guided. Such valleys and the streams that drain them are called subsequent. As the subsequent streams increase their drainage area, the original basins of the consequent branch streams are split up; thus the whole drainage area is more minutely subdivided and the rainfall is more promptly delivered to the water-courses. Commensurate with this change, the area of wasting slopes is increased, and thus the load washed down to the streams, and by them to the main river, is also increased. It may happen that the grade assumed by the main stream at the beginning of its adolescence is then found to be too faint, and hence some of the load is laid down, building a FLOOD-PLAIN (*q. v.*), and thus steepening the grade of the river and giving it a velocity that enables it to carry the remaining load. The deep alluvium with which the trench of the Missouri river is partially filled may have been accumulated in this manner, for the upper branches of this river are actively gnawing into the plains, and rapidly increasing the area of wasting slopes from which the load of the trunk river is chiefly derived.

*Migration of Divides.*—During the adolescent stage of river life it frequently happens that a stream may gnaw its way headward into the valley of another stream of the same river system or of an adjacent system, whose channel is at a higher level on account of greater distance to the sea, or of resistant rocks which have retarded its deepening somewhere farther down its course. Then the growing stream, working to advantage on the steeper slope or on the weaker rocks which guide its growth, may tap the other, thus abstracting its upper part and diverting it to the growing stream and leaving its diminished and beheaded lower part to follow its former valley. Subsequent streams are particularly active in making captures of this kind. Thus one river system may grow at the expense of another, as the divide between them is forced to migrate away from the steeper streams at the heads of the deeper valleys. Changes of this kind are going on in the Alps, where the Italian streams are frequently gaining at the expense of those discharging northward—as, for example, in the upper Engadine valley, where the Maira is capturing the headwaters of the Inn.

*Deltas.*—During all this time of river growth most of the land-waste that has been carried down to the river mouth accumulates there, forming a DELTA (*q. v.*), while the finest waste is carried out to deeper water. Rivers that enter the sea from steep mountain-slopes build stony deltas; but ordinarily the delta is composed of silt, reduced to fine texture during its long travel from its source down the valley to the sea. Under a fitting climate deltas are therefore fertile, and may support a large population, although exposed to the danger of sudden changes in the course of the river branches that traverse them and of FLOODS (*q. v.*) both from the rivers and the sea, the latter being caused by the high water of on-shore storm-winds. The outline taken by the growing delta varies according to the ratio of the power and load of the river to the activity of the shore-waves and currents. When the former are in excess, as at the mouth of the Mississippi, the delta grows rapidly forward with branching fingers wherever the distributary streams enter the sea; but where the waves and currents have the upper hand, the front of the delta is rounded, as in the case of the Rio Grande, where there is a smooth curve, convex seaward. The delta of the Po is of intermediate form. Acutely pointed deltas, like that of the Tiber, are probably caused by the combined action of river and shore currents.

*Flood-plains.*—As the delta grows forward there is necessarily a slight building up all along the flood-plain in order to maintain the needed grade of the river; and this entails an extension of the flood-plain up the valley, particularly at that stage of river life when the load is increasing. Hence with advancing adolescence this extremely valuable portion of the river valley increases its area, tempting occupation from its fertility, but, like the delta, subject to danger from floods. The Ohio valley offers an excellent illustration of this phase of river growth. The flood-plain and delta are somewhat higher along the river banks, where the silt is deposited at time of overflow; the plain slopes gently to either margin as well as down the valley. Consequently,

cence or maturity of the cycle thus introduced. For example, the slanting upland of New England is dissected by the Connecticut, whose valley deepens inland in consequence of the greater elevation that the old lowland has received in Northern Massachusetts than at the coast. The valleys of the Hudson, Delaware, Susquehanna, Potomac, and others are similarly accounted for.

Inequality of slope in adjacent river systems introduced by gentle warping is an effective means of promoting the migration of divides, the steepened streams gaining area at the expense of those whose slope is decreased. Thus it is believed that the present northwest course of the Tennessee, near Chattanooga, is a diversion from a former southwest course, in consequence of slight deformation of the region.

More decided deformation is detected along the northern margin of the Alps, where the mountain-making forces seem to be invading the Piedmont districts and crushing them into incipient folds. When a land-surface is thus more or less warped the graded courses of its rivers are deformed; thus lakes may be formed where the river trough is depressed, and more active valley cutting may be induced where it is elevated, and in this way the marginal lakes of the Alps are explained, although glacial action has also undoubtedly contributed to their origin. The deformation of the Limmat, producing Lake Zurich, has been minutely studied.

Similar changes have progressed to a more advanced stage in the southern marginal ranges of the Himalaya; but while ephemeral lakes may have been formed on various outflowing rivers up-stream from the line of uplift, this stage is now past, and the rivers escape across the new ranges with unobstructed flow and essentially along their former courses; for the upturned strata of the foot-hills are the delta deposits of the earlier stage of river history. Rivers like these, of which the Sutlej may be taken as the type, maintained their flow in spite of uplifts across their course, and are called antecedent. The Green river of Wyoming, a chief head-stream of the Colorado, is by some regarded as antecedent, being thought to have kept its course through the great uplift of the Uinta Mountains; but the argument to this conclusion does not seem to be decisive.

**Volcanic Accidents.**—The lava-flows poured forth by volcanic or fissure eruptions run to the lowest ground that they can reach, and gradually congeal. In this way the rivers of the lava-buried areas are displaced and take new courses alongside of or across the lava surface. Thus the Snake river, gathering mature head waters among the mountains of Western Wyoming, crosses the lava-plains of Idaho in a young cañon; its upper and lower parts are as dissimilar as the upper and lower parts of an extended river that comes from older inland uplands to a newer coastal plain. If the region possessing displaced rivers of this kind is elevated the revived streams cut down new valleys to one side of their buried valleys, such being the relation of several older and newer rivers on the western slope of the Sierra Nevada in California, where the old river-gravels buried under the lava-flows are much sought for as a source of gold, while the new rivers flow in deep cañons.

**Climatic Accidents—Desiccation.**—When the climate of a region turns from humid to arid the supply of a river system weakens, the head waters shorten, and the volume diminishes. In crossing lowlands the river is further lessened by evaporation, so that it may at last disappear, though its course to the sea remains open. Withered rivers of this kind may be found in the Argentine Republic, where they fail to reach the ocean, although the country slopes forward from their lower ends. Many withered rivers are found in the Great Basin of the U. S., where the side-streams, descending from the mountains, are unable to reach their former trunk stream, while the dwindling trunk stream fades away on the desert plains. During winter rains the withered system is somewhat invigorated; in summer droughts it is reduced to disvered remnants. In the Sahara the withering of the rivers is often complete; the valleys or wadies remain, but they lead no water, unless beneath the sands of their trough.

**Climatic Accidents—Glaciation.**—The effects of glaciation (see GLACIERS) are among the most interesting accidents that can happen to rivers; and they are of great importance to civilized nations, inasmuch as they prevail over parts of Northeastern America and Northwestern Europe. During the occupation of a country by an ice-sheet there is a peculiar drainage system upon and under the ice, as is observed in Greenland and Alaska. Streams fed by rains and

surface-melting in summer flow for a time on the surface, and then disappear by plunging down crevasses; they emerge from tunnels at the ice margin, sometimes bursting out with much energy, and bearing a heavy load of coarse and fine detritus, which they spread out in their further course, often building up stony flood-plains in their valleys or deltas in the sea.

During the retreat of an ice-sheet it sometimes evacuates a district that slopes toward its front. A marginal lake then accumulates in the depression and overflows at the lowest point in the rim, scouring down a valley trench of considerable size; but when a still further retreat of the ice allows a lower discharge of the lake, this trench is abandoned except by such local drainage as it may receive from either side. In this way explanation is given of certain small rivers in broad valleys in the northern part of the U. S.; the upper Minnesota, the Desplaines by Chicago, Little river between the heads of the Maumee and the Wabash in Ohio, the Mohawk by Rome, N. Y., all being examples of this curious kind (*Popular Science Monthly*, Nov., 1894).

The most striking glacial accidents in river history are found after the retreat of the ice from the glaciated country, when the surface streams again take unconstrained possession of it. Supposing that the region had had a matured drainage system before the ice invasion, then the ice rounds off the peaks and ridges, deepens and widens the valleys, often eroding basins in their troughs, or clogging them with the drift that is left irregularly distributed over the country. The preglacial stream lines are therefore more or less obstructed, and hence the post-glacial streams often lose their way, being here detained in an eroded basin or in a hollow behind a drift barrier, and there turning across an old divide or spur along a new line of flow. Streams thus affected are as a rule characterized by frequent lakes and long reaches alternating with rapids or gorges along their new courses. (See LAKES, CATARACTS, and GORGE.) The delicacy of adjustment to structural lines that prevailed in the preglacial drainage system is confused or lost. There are little streams in large valleys; large streams in little valleys; falls in the lower portion of the river courses; and lakes everywhere. The rivers of Canada, Maine, Scandinavia, and other glaciated regions exhibit all these features in profusion. They are rapidly establishing better graded channels; filling lakes, which appear as meadows; pushing back falls and cutting down gorges (see NIAGARA FALLS); terracing valleys that were clogged with drift. The economic value of the rapids and falls thus produced is very great; nearly all the manufacturing cities of New England are located at water-powers of this accidental origin; Ottawa, Rochester, and Minneapolis are similarly determined.

**Complicated History of Large Rivers.**—While the several phases in the life and development of rivers here outlined are easily apprehended when considered separately, such is not the case with the development of actual rivers of large size, such as the Mississippi, Amazon, Rhine, or Danube. The successive uplifts by which the present drainage area has been constructed; the various cycles or partial cycles of denudation through which one part or another of the river has advanced; the accidents that its different branches have suffered—all combine to accumulate a history so complex that geographical study in its present state does not suffice to apprehend it clearly. Yet the real significance of each part is so closely dependent on its plan of development, and the relations of the various parts of a river system follow so distinctly from the history that they have been through, that nothing less than an analysis of their origin suffices to bring them clearly before the understanding. A full account of the Mississippi system would require an extended monograph. Its oldest parts are probably to be found in the upper branches of the Tennessee and New rivers, which descend from the mountains of Carolina and Virginia. Similar ancient head waters in Pennsylvania have been turned by diversion or deformation into the Atlantic rivers. Along the northern watershed the deposits of glacial drift are at many points sufficient to alter the direction of preglacial drainage; the so-called head of the Mississippi is certainly one of its youngest parts. The great western branches, the Missouri, Arkansas, and others, are young compared to the Ohio. The lower course of the trunk stream is a recent addition to the upper branches.

**Economic Relations of Rivers.**—In the economies of nature rivers are the great avenues of transportation along which the waste of the land, gathered by the creep of the soil and the wash of the wet-weather streams, is carried to

the name of "accretion," as a valid means of acquiring title to land. The legal consequences of accretion are the same whether it goes on in public or private streams or on the seashore; but if the process of change be a sudden or violent one, it will have no legal consequences whatever. Thus if a watercourse should suddenly desert its ancient bed and form for itself a new channel, the original boundary-line between the opposite owners, running through the middle of the old bed, will be preserved unchanged.

The rights of the public, so extensive and important in the case of public waters, are greatly narrowed in the case of private streams. There is in general no common right of navigation or fishing or any other user in such waters. Nevertheless, a stream which is strictly private so far as the title to its shores and bed is concerned, may become subject to a public easement of navigation or of floating logs. The public right in such cases is presumably acquired from the riparian owners, a grant or dedication by the latter being presumed from the long and general use of the stream for such purpose by the public. It is, however, highly probable that considerations of public policy will, in the newer parts of the U. S. at least, lead to a general recognition of common rights of navigation in suitable private streams, even where there has been no general use of the stream from which to infer a dedication.

For the distinction between riparian rights proper and such as pertain to waters percolating through the soil or flowing in undefined channels, see the article on WATERCOURSES. For other similar and related rights, see LAKES, RIPARIAN RIGHTS, SEASHORE, and authorities there cited.

GEORGE W. KIRCHWEY.

**Rivers, RICHARD HENDERSON, D. D.:** educator and minister of the Methodist Episcopal Church South; b. in Montgomery co., Tenn., Sept. 11, 1814; graduated at La Grange College, Alabama, in 1835; elected Assistant Professor of Languages, and in 1836 Professor of Languages, in that institution; was president of the conference school at Athens, Ala., in 1843; vice-president and Professor of Moral Science in Centenary College, Louisiana, in 1848, and president in 1849; was called to the presidency of La Grange College in 1854, and remained in that position after the removal of the institution to Florence, Ala., and the change of the name to Wesleyan University, until it was broken up by the civil war; was subsequently president of Somerville Female College, Tennessee, Centenary Institute, Summerfield, Ala., and Logan Female College, Kentucky; was president of Martin Female College, Pulaski, Tenn., 1874-78; was pastor in Auburn and Eufula, Ala., 1878-83; took charge of Broadway church, Louisville, Ky., 1883-87; was a member of the Tennessee Conference; published *Mental Philosophy, Moral Philosophy, Our Young People* (1880); *The Life of Robert Paine* (1884); and *Arrows from Two Quivers* (1890). D. at Louisville, June 21, 1894. Revised by A. OSBORN.

**Riverside:** city (founded in 1870); capital of Riverside co. (created from the southwest part of San Bernardino County in 1893), Cal.; on the Santa Ana river, and the Southern Cal. Railway; 118 miles N. W. of San Diego (for location, see map of California, ref. 12-G). It was founded by colonists from New England, who constructed two irrigating canals, one of which cost \$50,000, and engaged extensively in the cultivation of oranges, lemons, figs, and grapes, the manufacture of pottery and cabinet furniture, and the production of raisins. There are several churches, public and private schools, high school, two libraries (Library Association, founded in 1879, and Public, founded in 1889), 2 national banks with combined capital of \$200,000, 3 State banks, a savings-bank, and 2 daily and 3 weekly newspapers. Pop. (1890) precinct, 1,358; (1890) city, 4,683.

**Rives, AMÉLIE:** See CHANLER, AMÉLIE.

**Rives, WILLIAM CABELL:** Senator; b. in Nelson co., Va., May 4, 1793; educated at Hampden-Sidney and William and Mary Colleges; studied law under Jefferson; served as a volunteer in the war with England 1812-15; became prominent in Virginia politics; was a member of Congress 1823-27; minister to France 1829-32, and again 1849-53; Senator from 1832 to 1845, with a brief interruption; a member of the peace conference of 1861, and of the Confederate Congress at Montgomery. D. near Charlottesville, Va., Apr. 26, 1868. He was the author of *The Life and Times of James Madison* (Boston, 3 vols., 1859-69) and other works.

**Riviera, rî-vî-è-râa** (i. e. the shore): name given to the coast of Liguria, Italy, from the French frontier to the Cape

of Porto Venere, near Spezia (see map of Italy, ref. 4-B). It is celebrated for its natural beauty and the salubrity of its climate. Its winter climate is one of the most mild and genial known, and this, with its ready accessibility, attracts to it each winter a very large number of invalids. It is customary to divide it into the Eastern Riviera (Riviera di Levante) and the Western (Riviera di Ponente), the two meeting at Genoa. See Black, *The Riviera, or the Coast from Marseilles to Leghorn* (1890); Murray, *A Handbook for Travellers on the Riviera* (1890); Macmillan, *The Riviera* (1892). MARK W. HARRINGTON.

**Riviere, rê-vî-âr', BRITON:** figure and animal painter; b. in London, Aug. 14, 1840; pupil of his father, William Riviere (1806-76); graduated at Oxford in 1867; Royal Academician 1881; medal, Centennial Exposition, Philadelphia, 1876; third-class medals, Paris Expositions, 1878 and 1889. Two of his most celebrated works are *Let Sleeping Dogs Lie* and *The Astrologer*. Studio in London. W. A. C.

**Rivière du Loup (EN BAS), -dû-loo':** post-village (called also FRASERVILLE); Temiscouata County, Quebec, Canada; on the southeastern shore of the river St. Lawrence, 125 miles below Quebec, and terminus of the Temiscouata Railway, at the mouth of the picturesque stream of the same name (see map of Quebec, ref. 8-E). It is the seat of Fraserville Institute, a convent, and an academy, and has a good trade. It is a place of summer resort. Pop. (1891) 4,175, nearly all French.

**Rivière du Loup (EN HAUT), now Louiseville:** post-village; capital of Maskinongé County, Quebec, Canada; on the north shore of Lake St. Peter, 68 miles below Montreal (see map of Quebec, ref. 4-B). It has a good trade and manufactures of leather. Pop. about 2,000.

**Rix-dollar** [from Swed. *riksdaler*; Germ. *reichsthaler*; reich (Swed. *rik*), kingdom, realm + *thaler* (Swed. *dalarn*, thaler, dollar): a silver coin formerly used in the Scandinavian countries and Germany. Its value varied in the different countries from a little less than 40 cents to a little more than a dollar.

**Rizzio, rit'sè-ô, or Riccio, rit'chè-ô, DAVID:** minister of Mary, Queen of Scots; b. at Turin, Italy, in 1540; the son of a dancing-master; was brought up in France; became an accomplished musician; obtained favor at the court of Savoy, where he was selected on account of his skill in languages to accompany an embassy sent to Scotland about 1563. Having attracted the attention of Mary, Queen of Scots, by his musical talent, she appointed him one of the pages of her chamber, and soon afterward (Dec., 1564) made him her secretary for foreign languages. He acquired great influence over her, and was accordingly hated by less fortunate courtiers; was an advocate of the marriage to Darnley, after which he was appointed keeper of the privy purse to the king and queen; was bitterly denounced by Knox and the Reformers on account of his Roman Catholicism; has even been regarded by some writers as a secret papal legate, and was regarded by many as the queen's paramour and father of Prince James. Several of the most powerful nobles, especially Morton, Ruthven, Lindsay, and Maitland, formed a conspiracy to assassinate him, and obtained the written concurrence of the weak Darnley by working upon his jealousy and by promising him the title of king. Introduced by Darnley into the queen's chamber, Ruthven and George Douglass struck down Rizzio in her presence, dragged him into the adjoining room, and killed him Mar. 9, 1566. It has been charged that Knox and other Reformers were privy to this murder. This is improbable, but Knox wrote of it in his *History of Scotland* as "a just act, and most worthy of all praise." F. M. COLBY.

**Roach** [M. Eng. *roche*, connected with O. Eng. *reohha*, Germ. *roche*, roach. The Eng. *ray*, name of same fish < Fr. *raie* < Lat. *râja*]: a kind of fish, the *Rutilus rutilus*, of the family *Cyprinidae*. It is placed with its associates in a group distinguished by the pharyngeal teeth being in single series of five or six each, with crenate ridges and slightly hooked tips, the presence of twelve to fourteen anal rays, and the position of the dorsal fin opposite to the ventrals; the body is silvery, and the lower fins tinged with red, at least in the adult; the mouth is terminal. The roach generally attains a length of about 8 inches, and sometimes reaches as much as 10 or 12, and is under a pound in weight. It is distributed throughout Europe N. of the Alps, and, though insignificant as a game-fish, it is generally included in European works on angling. In the U. S.

Head-runner: See Decker.

Roads (fr. Eng. *road*, a riding, journey, road, deriv. of *roden*, *rode*): highways in the country and the streets in vil-

lages and small towns, often called common roads to distinguish them from paved city streets and from railways. The number of roads in a civilized community involves a large outlay for construction, and a heavy annual expenditure for repairs, so that the question of economy in road-making and maintenance is an important one. Good roads promote traffic and industry, while poor ones are a constant bar to the development of the towns which they connect. The location, construction, and maintenance of roads form a branch of civil engineering, and it is only the engineer who can conduct these operations so as to secure the greatest public convenience with the least expenditure.

The Romans built many roads extending to all parts of the empire, and portions of some of these are found at the present day in fair condition. Twenty-nine military roads centered at Rome, which with their numerous branches had, according to Antoninus, a total length of 52,964 Roman miles. The most important of these had a paved width of 16 feet, with curbs and unpaved sidewalks, but the prevailing width was 8 feet. There were also roads for single carriages, and for horsemen, of lesser width. The military roads were essentially pavements of dressed stone blocks, laid with very close joints on a foundation of concrete which rested on a sub-foundation of large flat stones, the entire thickness being about 3 feet. The road surface was quite smooth, and level transversely. Grade was usually disregarded, and the course of the road laid out in a straight line over hills and valleys. Milestones marked the distances from all parts of the empire to a gilt column in the Forum at Rome. In respect to durability, these roads were probably superior to any since constructed, but they were very expensive and the steep grades often rendered portions ill adapted to traffic. Macadam has said that their construction "was a kind of desperate remedy to which ignorance has had recourse," and from the point of view of engineering economy and the proper adaptation of means to ends Roman roads can not be recommended.

A number of Roman roads were built in England in the second and third centuries, and later some of these were widened and made public highways. The roads in England and throughout Europe were, however, in a deplorable condition during the Middle Ages, and indeed until the beginning of the nineteenth century no systematic method of construction and repair was known. About 1350 certain roads in England were given to private companies to repair, and toll was allowed to be collected. In 1553 the parishes were made responsible for the maintenance of the roads, but the burden proved to be too heavy, and the results were unsatisfactory.

The early explorers of Mexico and Peru found excellent roads between the principal towns. One of the military roads of Peru is said to have been nearly 2,000 miles long, with tunnels through mountains and bridges or ferries over streams; this was 20 feet wide and paved with flagstones covered with bitumen. In India and Persia there were also a few good roads in early times. In the latter country royal roads for the use of the ruler were built by the side of the common roads and kept in better condition, from which originated the phrase "There is no royal road to learning."

The earliest roads in the U. S. were mere Indian trails along watercourses and through gaps in mountain ranges. In New England the towns had control of roads, and there are records of some "eight and ten rods wide" which were authorized to be laid out, but only about one or two rods were devoted to traffic, the remainder being left uncleared. The prevailing method of construction and repair, when any method at all was used, was to plow two parallel furrows about 20 feet apart and scrape the loosened earth upon the space between them to form the road-bed.

Turnpikes were maintained in the U. S. during the eighteenth century by private companies which were allowed to collect toll, and the surface of these was often of gravel or broken stone. In 1796 an act of Congress authorized a national road from Baltimore westward, which was built for 650 miles through Pennsylvania, Ohio, and Illinois; its width is 80 feet, of which 30 feet is of broken stone, sometimes on a foundation of large stones. Although not properly kept up since the introduction of railways, it is still known as a good road.

The roads of Europe are in a far better condition than those of the U. S. This is due partly to the fact that they are older, but mainly to better and more effective methods of construction and maintenance. Gravel or broken stone is employed for a road surface, proper drainage is provided,

and systematic repairs are made at stated intervals. The dirt from the gutters is carted away instead of being spread on the road-bed, while this is kept in good condition by the frequent addition of broken stone properly compacted and rolled. Among the famous roads of Europe may be mentioned that from Geneva, over the Simplon Pass of the Alps, to Milan, which was built by Napoleon as a military route, and which cost the French Government about \$3,250,000, or nearly \$15,000 per mile; this is more than double the cost of construction of good roads under ordinary conditions.

About 1885 public opinion in the U. S. began to be aroused, mainly through the influence of bicycle riders and manufacturers, as to the deplorable condition of country roads and the great advantage of better methods of construction and repair. This movement has been productive of excellent results, yet very much remains to be done in order that these roads may be in a condition comparable to those of Europe. Methods of locating, building, and repairing roads are well known to civil engineers, and can be as easily carried out as those for the construction and maintenance of railways, but the public refuses or neglects to intrust the work to them. County commissioners, township supervisors, selectmen, and borough committees are the authorities who control the building and repair of roads, and these generally decide nearly all questions relating thereto, irrespective of the experience of other localities or of the rules of engineering. The method, so extensively prevailing, whereby farmers are allowed to work out their road-tax instead of paying it in money, is perhaps the greatest evil of the present system, and wherever it prevails good roads can never be secured. Under this method the mud of the gutters is annually loosened by the plow, transferred by the scraper to the middle of the street, and spread to a rounded surface without any attempt at compacting or rolling, so that the rains wash it quickly back again to the sides and the condition of the road during a large part of the year is very poor. It is safe to say that in the majority of cases the money spent in such repairs is entirely wasted.

The cost of road improvements in fifty counties of the State of New York during 1892 was \$2,716,000, and this does not include that spent in cities, towns, and villages. This annual sum, if expended in accordance with engineering principles, is sufficient to produce in a few years roads comparable in every respect with those of Europe.

It is one of the gratifying features of the road agitation that State Legislatures are urged to make such laws as will insure that the construction and maintenance of common roads shall be placed in the hands of civil engineers. Every effort spent in securing the passage of such laws tends to the improvement of roads. The building of a common road is easy compared to that of a railway; the principles and methods are given in great detail in engineering literature, and it is by the scientific application of these that the roads of Europe have been brought to such a high degree of perfection.

**Location.**—A road should be so laid out that its length between the points to be connected is as short as possible, the grades at the same time being such as to allow easy traction for vehicles and also thorough drainage. A slight grade will provide for drainage if proper ditches are constructed. The maximum grade for earth roads should be about 10 per cent.—that is, 10 feet of vertical rise to 100 feet of horizontal distance, while gravel roads may be limited to 7 per cent., and macadam roads to about 4 or 5 per cent. On these grades a horse exerts twice as much force in pulling up the load as on a level.

The width of roads in the U. S. has usually been too great. Sixteen feet is sufficient for the easy passage of two vehicles, and it is better that this width should be kept in good condition than that 30 or 40 feet should be maintained in poor order at greater cost. In the neighborhood of cities widths of 24 or 30 feet are sometimes required. To these widths are to be added those necessary for gutters or ditches, and for sidewalks when such are necessary.

The best transverse form is that of two planes of slight inclination connected by a short curved surface near the middle. It is a common error to make the section too rounding and the inclination of the sides too steep. Many good roads show to the eye but little elevation in the middle, and the harder and smoother the road-covering the less is the elevation required.

**Construction.**—In order to render the road free from dust and mud and the traction easy to animals some kind of road covering other than the natural soil is usually neces-

from eighteen States and Territories and four foreign countries in 1894-95. The college offers a four years' course, with electives. The grounds embrace about 20 acres. There are four brick buildings for college purposes. One of these is set apart for the library, which contains 17,000 volumes. An annex to this building was erected in 1894 for a reference library and reading-room. The mineralogical and geological cabinets contain about 14,000 specimens, and there is also a valuable numismatic collection. Two literary societies and a Y. M. C. A. are maintained. **JULIUS D. DREHER.**

**Roanoke River:** a stream formed by the union of the Dan and Staunton rivers at Clarksville, Va. It flows 250 miles in an E. S. E. course into Albemarle Sound near Plymouth, N. C. It is a tidal stream to Halifax Falls, N. C., 75 miles from its mouth, and is navigable 75 miles farther to Weldon by steamboats, and throughout its course by bateaux. Its valley is picturesque and fertile.

**Roaring:** the noise made by some horses while drawing in the breath, especially while traveling fast. It is caused by a kind of wasting disease of the muscles of the larynx, and is incurable. Nevertheless, some of the best horses, like the great Eclipse, have been confirmed roarsers. In England tracheotomy and the continued use of the tracheotomy-tube have been successfully employed for its relief.

**Roasting:** See **COOKERY**; also **METALLURGY**.

**Roatan:** See **RUATAN**.

**Robbery** [from O. Fr. *roberie*, deriv. of *rober*, rob : Ital. *rubare*, from O. H. Germ. *roubon* > Mod. Germ. *rauben*, plunder, rob]: larceny from the person of another by violence or putting him in fear. The force or fear must precede or accompany the larceny. Hence it is not robbery to snatch from the hand of another and carry away his purse, or stealthily to take it from his pocket and then frighten him from retaking it. On the other hand, if the article taken is so attached to the person that violence is necessary to detach it, as where a watch-cord is broken in taking a watch, or where an earring is torn from the ear, or if the owner surrenders the property because put in fear by the taker, robbery is committed. The fear need not be of injury to the body of the person robbed. Fear of injury to that which he has a right to defend by force, as his child or his property, will suffice. It has been held that a threat to injure another's character in order to induce him to surrender his property is a sufficient putting in fear. Other decisions hold that the threat of injury to character must consist in charging the victim with unnatural crime. *Britt vs. State*, 7 Humphrey (Tenn.) 45.

The courts have given to "the person" an extended meaning in the definition of robbery. Whenever the stolen property is so in the possession or under the control of an individual that violence or putting in fear is the means used by the thief to secure it, the taking is from the person. Accordingly, a thief commits robbery when he binds the owner in one room of his house and frightens him into telling where property is to be found in another part of the building. *State vs. Calhoun*, 72 Iowa 432.

Robbery was a capital felony at common law. It is punishable in Great Britain by penal servitude. In many of the U. S. it has been defined by statute and divided into degrees, punishable by imprisonment for periods of varying length. See **LARCENY**. **FRANCIS M. BURDICK.**

**Robbia**, **LUCA**, della; sculptor; b. in Florence, Italy, about 1399; at first a goldsmith, he soon devoted himself to larger work in bronze and marble. At the age of fifteen he went to Rimini, where he sculptured some fine bas-reliefs for the tomb of the wife of Sigismund Malatesta. Being recalled to Florence by an order to do work for Santa Maria del Fiore, he executed six compositions for the campanile. At the age of seventeen he was further commissioned to design the marble ornament of one of the organs of the cathedral, having Donatello in competition with him. Luca's design was considered the finer, although neither was executed; but the bronze door of the sacristy beneath this organ was intrusted to him, for which he modeled ten figures and many lovely heads and other ornaments. After these works he gave up bronze and modeled in clay, having discovered a glaze that protected his work from atmospheric injury. The first of his decorations in this medium are in Santa Maria del Fiore, in the arch over his own bronze door, as well as over the arch of the sacristy, as also a *Resurrection* of marvelous beauty, now in the Academy of Fine Arts in Florence. Luca afterward found out how to give color to his ware. His

first experiment in the colored glaze was in Or San Michele, and this reminds one of maiolica in its brilliancy. The fame of this new decorative work soon spread through Italy and over Europe, and his orders were innumerable—both for large panels for the inner decoration of churches as well as for outer walls above doorways, etc. His works abound in Tuscany. His brothers Ottaviano and Agostino, who were his pupils, helped him in the production of these works, and continued them after his death (in 1482). **ANDREA DELLA ROBBIA**, nephew of the famous Luca and son of his brother Mark, was born in Florence about 1436. He showed great artistic capabilities from an early age. After having shown his skill in the marble decorations of the chapel of Santa Maria delle Grazie, outside Arezzo, he devoted himself to producing colored reliefs in terra-cotta for Santa Maria delle Grazie, for the Cathedral of Arezzo, and for the loggia of the Hospital of the Innocents in Florence, besides much other work. He died in 1525.—His sons, **GIOVANNI**, **LUCA**, and **GIROLAMO**, also worked in their father's manner. Although the elder Luca, as the founder of the art, enjoys a special prestige among the Robbias, Andrea undoubtedly was the most talented. **W. J. STILLMAN.**

**Robbins, CHANDLER, D. D.**: clergyman; b. at Lynn, Mass., Feb. 14, 1810; graduated at Harvard 1829, and became pastor of the Second church (Unitarian) at Boston 1833, which position he long retained. He was the author of many addresses, sermons, and occasional publications; of a *History of the Second Church* (1852); of *Memoirs of Maria E. Clapp* (1858) and William Appleton (1863); and one of the editors of the *Proceedings of the Massachusetts Historical Society*, of which he was an active member. D. at Weston, Mass., Sept. 11, 1882. For biographical sketch, see Rev. O. B. Frothingham's *Boston Unitarianism* (1890).

**Robert I.** (King of Scotland): See **BRUCE, ROBERT**.

**Robert II.**: King of Scotland; founder of the Stuart dynasty; b. in Scotland, Mar. 2, 1316; son of Lord Walter Stewart, by Marjory, daughter of Robert Bruce; fought at the battle of Halidon Hill (1333); became joint regent with the Earl of Murray 1334, and sole regent 1338-41, during the minority and absence in France of his uncle, King David II.; was again regent with the Earl of March from the capture of the king at the battle of Nevill's Cross Oct., 1346-57; opposed a successful resistance to the project of imposing Lionel, Duke of Clarence, upon Scotland as king, and renewed his oath of fealty to David II. 1363; was imprisoned 1363-69; declared king after the death of David Feb., 1371; was crowned at Scone Mar. 26, 1371; conducted two wars with Richard II. of England, in the second of which the successful forays of Richard II. and the Duke of Lancaster into Scotland took place. These were avenged in 1388 by a successful invasion of England by two armies, one of which, commanded by James, Earl of Douglas, fought and won the celebrated battle of Otterburn (or Chevy Chase) July 21, 1388, but lost its leader. The kingdom suffered much from the border wars and from the disorders of the turbulent barons. D. at Dundonald Castle, May 13, 1390.

Revised by **F. M. COLBY.**

**Robert III.**: King of Scotland; son of Robert II. by his first wife, Elizabeth Mure of Rowallan; b. in Scotland about 1340; was first known as John Stuart, Earl of Carrick; succeeded to the throne in 1390; renewed the war with England 1399; was an imbecile ruler and left the administration in the hands of his ambitious and unscrupulous brother, Robert Stuart, Earl of Menteith, by whom the heir to the throne, David, Duke of Rothesay, was imprisoned and starved to death in Falkland Castle 1402. In 1400 occurred the invasion of Scotland by Henry IV. of England and the retaliatory expedition of the Scots resulted in their terrible defeat at Homildon Hill 1402. Robert sent his surviving son, Prince James, to France for safety against the designs of Menteith, and became the victim of incurable melancholy on learning the imprisonment of his son by the English, May, 1405. D. at Rothesay, Bute, in 1406.

**Robert II.**, surnamed **THE DEVIL**: Duke of Normandy; son of Richard the Good; succeeded his brother Richard in 1028. He humiliated his vassals and kept order in his realm; conquered districts from his neighbors and regulated his frontiers; supported Count Baldwin IV. of Flanders against his sons, King Henry I. of France against his mother, and his nephews, Alfred and Edward of England, against Canute of Denmark; made Normandy the most powerful state in

sylvania, he was appointed to important churches in Baltimore, Philadelphia, etc., and in 1816 was elected bishop. He immediately returned to Western Pennsylvania and thence removed to Indiana, then the far West. He did much for Western missions, and the Indians called him "the grandfather of all the missionaries." D. in Lawrence co., Ind., Mar. 26, 1843. Revised by A. OSBORN.

**Roberts, Sir WILLIAM, M. D., F. R. S.:** clinician; b. in Anglesea, Wales, Mar. 18, 1830; graduated M. D. London University 1854; was physician to the Manchester Royal Infirmary 1855 to 1886, and Professor of Clinical Medicine at the Victoria University from 1876 to 1886. He practiced his profession in Manchester from 1885 to 1889, removing to London in the latter year. His more important publications are *A Practical Treatise on Urinary and Renal Diseases* (London, 1865; 4th ed. 1885); *Lectures on Dietetics and Dyspepsia* (London, 1885; 2d ed. 1886); *On the Chemistry and Therapeutics of Uric Acid, Gravel, and Gout* (London, 1892). S. T. ARMSTRONG.

**Roberts, WILLIAM CHARLES, D. D., LL. D.:** minister, educator, and secretary; b. at Galltmai, Cardiganshire, South Wales, Sept. 23, 1832; educated at Princeton College and Theological Seminary; was pastor of the First Presbyterian church, Wilmington, Del., 1858-61; of the First Presbyterian church, Columbus, O., 1861-64; copastor in the Second church, Elizabeth, N. J., 1864-66; pastor of the Westminster church, organized from the Second church under his leadership, 1868-80; corresponding secretary of the board of home missions 1880-86; president of Lake Forest University 1886-92; and was reappointed corresponding secretary of the board of home missions in 1892. Dr. Roberts was chairman of the committee that established Wooster University, Ohio; member of the first Pan-Presbyterian council, Edinburgh, 1877, and of the third, Belfast, 1884, where he read a paper on American colleges; moderator of the General Assembly, New York, 1889, and a member of the committee for the revision of the Confession of Faith. He is the author of a series of letters on the great preachers of Wales, the translator of the *Shorter Catechism* into Welsh, and has published occasional sermons. C. K. HOYT.

**Roberts, WILLIAM HENRY, D. D., LL. D.:** minister and professor; b. at Holyhead, Wales, Jan. 3, 1844; was educated at the College of the City of New York and Princeton Theological Seminary; statistical clerk in the U. S. Treasury Department 1863-65; assistant librarian of Congress 1866-72; pastor at Cranford, N. J., 1873-77; librarian of Princeton Theological Seminary 1877-86; Professor of Practical Theology in Lane Seminary 1886-93; permanent clerk of the General Assembly 1880-84, and since 1884 has been stated clerk of the same body. Dr. Roberts was elected American secretary of the Pan-Presbyterian council, London, 1888. He helped prepare the general catalogue of Princeton Theological Seminary 1881, and the catalogue of the library in the same institution 1886. He has published *Inaugural Address*, Lane Seminary (1886); *History of the Presbyterian Church in the United States of America* (1888); *Ecclesiastical Status of Theological Seminaries* (1892); sermons and magazine articles. C. K. HOYT.

**Roberts of Kandahar, FREDERICK SLEIGH ROBERTS, Baron:** British general; b. in Cawnpur, India, Sept. 30, 1832; educated at Eton, Sandhurst, and Addiscombe; entered the Bengal artillery 1851; promoted through various grades to that of lieutenant-general 1883; served with great distinction in the Indian mutiny campaign, the Abyssinian campaign, and the Afghan campaigns; commander-in-chief in India 1885-93. His most noted exploit is the relief of Kandahar in the summer of 1880. He was created a baronet in 1881, and Baron Roberts of Kandahar, Jan., 1892. The soldiers nicknamed him Bobs Bahadur, the latter word meaning hero or champion. C. H. T.

**Robertson, FREDERICK WILLIAM:** clergyman; b. in London, England, Feb. 3, 1816; abandoned the plan he had formed of entering the army; entered Brasenose College, Oxford, 1837, and graduated 1840; was settled in Winchester 1840-42, in Cheltenham 1842-47, in Oxford 1847, going that year to Brighton, where he died Aug. 15, 1853. Of his works, there have been published *Sermons preached at Trinity Chapel, Brighton* (five series, London, 1855-64); *Lectures and Addresses on Literary and Social Topics* (1858); *Expository Lectures on St. Paul's Epistles to the Corinthians* (1859); and *Notes on Genesis* (1877). His fame was posthumous, but it is permanent. His writings and biography were reprinted in the U. S. and widely read. He was one of

the greatest and most inspiring of modern preachers, and has exerted great influence in liberalizing religious thought. He was, however, more a preacher than a theologian, and he left little in systematic form. He is usually, although perhaps erroneously, classed with Maurice and Stanley as a founder of the modern Broad Church party in the Church of England. See his *Life and Letters*, edited by Stopford A. Brooke (2 vols., 1865).

**Robertson, GEORGE CROOM:** educator and metaphysician; b. at Aberdeen, Scotland, Mar. 10, 1842; educated at Aberdeen, Berlin, and Göttingen Universities; became Assistant Professor in Greek at Aberdeen in 1864; Professor of Philosophy in University College, London, 1866-92; was editor of *Mind* 1876-91. D. in London, Sept. 21, 1892. His principal writings are *Hobbes*, in Blackwood's *Philosophical Classics* (1886), and several articles in *Encyclopædia Britannica* (9th ed.) and in the *Dictionary of National Biography*. He aided Alexander Bain in editing Grote's posthumous work on *Aristotle* (1872). See *Philosophical Remains of George Croom Robertson*, with a brief memoir, edited by Alexander Bain. J. MARK BALDWIN.

**Robertson, JAMES:** royal governor of New York; b. in Fifeshire, Scotland, about 1710; served as deputy quartermaster-general in the campaigns against Louisbourg and Ticonderoga 1758-59; was appointed lieutenant-colonel of the Fifty-fifth Regiment; exchanged into the Sixteenth; was stationed at New York as barrack-master 1763-75; became notorious for his extortions and speculations; was appointed colonel 1772; went to Boston July, 1775; was appointed major-general Jan. 1, 1776; commanded a brigade in the battle of Long Island; went to England 1777; was appointed royal governor of New York 1779; took the oath of office Mar. 23, 1780; exerted himself with Gen. Greene to procure the exchange of Maj. André; became lieutenant-general Nov. 20, 1782; d. in England Mar. 4, 1788.

**Robertson, JAMES, D. D.:** minister and professor; b. at Alyth, Perthshire, Scotland, Mar. 2, 1840; educated at the Universities of Aberdeen and St. Andrews; missionary in Hasskeni, Constantinople, 1862-64; in Beyrout, Syria, 1864-75; minister of Mayfield church, Edinburgh, 1876-77; since 1877 Professor of Oriental Languages in the University of Glasgow. Dr. Robertson has published many articles on Eastern topics in various magazines; translated and edited *Müller's Outline of Hebrew Syntax* (Glasgow, 1882; three subsequent editions); published *Introduction to the Pentateuch* in *Virtue's New Illustrated Bible*, republished in *Book by Book* (London, 1892); *The Early Religion of Israel*, Baird lectures, 1889 (Edinburgh, 1892; three later editions); *The Old Testament and its Contents*, in *Guild and Bible Class Text-books* (Edinburgh, 1893); and *The Psalms: their Place in the History and Religion of Israel*, Croall lectures, 1894 (Edinburgh, 1895). C. K. HOYT.

**Robertson, THOMAS WILLIAM:** actor and dramatist; b. in England, Jan. 9, 1829; became an actor in a traveling company of which his father was manager; produced a play, *A Night's Adventure*, in 1851; settled at London and devoted himself to literature 1860, and wrote several very successful dramas, including *David Garrick* (1864); *Society* (1865); *Ours* (1866); *Caste and Play* (1868); *School* (1869); *M. P.* (1870); and *Dreams* (1869). D. in London, Feb. 3, 1871. See his *Principal Dramatic Works* (2 vols., London, 1889).

**Robertson, WILLIAM, D. D.:** historian; b. at Borthwick, near Edinburgh, Scotland, Sept. 19, 1721; graduated at the University of Edinburgh 1741; became a minister of the Scottish Church at Gladsmuir 1743; joint minister of Greyfriars church, Edinburgh, 1759; principal of the University of Edinburgh 1762, and was appointed historiographer of Scotland 1764. D. at Grange House, near Edinburgh, June 11, 1793. Author of a *History of Scotland during the Reigns of Mary and James VI.* (2 vols., 1758-59); *History of the Reign of the Emperor Charles V.* (3 vols., 1769); a *History of America* (2 vols., 1777); and an *Historical Disquisition concerning the Knowledge which the Ancients had of India* (1791). During his lifetime and long afterward his name was ranked with those of Gibbon and Hume, and his complete *Works* have been often reprinted, but are now little read. His *Life* was written by Dugald Stewart (1801) and by Lord Brougham, who was a family connection.

**Robespierre, rō'bes-pi-ār', MAXIMILIEN MARIE ISIDORE:** revolutionist; b. at Arras, France, May 6, 1758. Losing his

**Robinson, CHARLES SEYMOUR, D. D., LL. D.:** clergyman and hymnologist; b. at Bennington, Vt., Mar. 31, 1829; educated at Williams College and Union and Princeton Seminaries; pastor of the Presbyterian churches—Park, in Troy, N. Y., 1855–60; First, in Brooklyn, 1860–68; of the American chapel in Paris 1868–70; Madison Avenue Presbyterian church, New York, 1870–87; Thirteenth Street 1890–92; since 1892 of the New York Presbyterian church, New York. Dr. Robinson has published *Songs of the Church* (New York, 1862); *Songs of the Sanctuary* (1865); *Songs for Christian Worship* (1866); *Short Studies for Sunday-school Teachers* (1868); *Chapel Songs* (1872); *Bethel and Penuel* (1873); *Church Work* (1878); *Calvary Songs for Sunday-schools* (1875); *Psalms and Hymns* (1875); *Spiritual Songs* (1878); *Studies in the New Testament* (1880); *Spiritual Songs for Social Worship* (1881); *Spiritual Songs for Sunday-schools* (1881); *Studies of Neglected Texts* (1883); *Laudes Domini* (1884); *Sermons in Songs* (1885); *Sabbath Evening Sermons* (1886); *Simon Peter: Early Life and Times* (1887); *The Pharaohs of the Bondage and Exodus* (1887); *Studies in Mark's Gospel* (1888); *Laudes Domini for the Sunday-school* (1888); *Laudes Domini for the Prayer Meeting* (1889); *From Samuel to Solomon* (1889); *Studies in Luke's Gospel* (2 vols., 1889); *New Laudes Domini* (1892); *Annotations upon Popular Hymns* (1893); *Simon Peter: Later Life and Labors* (1894). C. K. HOYT.

**Robinson, EDWARD, D. D., LL. D.:** biblical scholar; b. at Southington, Conn., Apr. 10, 1794; graduated at Hamilton College 1816; was tutor there 1817–18; remained in Clinton, engaged in classical studies, till the autumn of 1821, when he went to Andover, Mass., to publish an edition of eleven books of the *Iliad* (the first nine, the 18th, and the 22d); was instructor in Hebrew in Andover Seminary 1823–26, under Prof. Stuart, whom he assisted in preparing the second edition (1823) of his *Hebrew Grammar*, publishing meanwhile (1825) his translation of Wahl's *Clavis Philologica Novi Testamenti*; studied in Europe, mostly at Halle and Berlin, 1826–30; in 1828 married, as his second wife, Therese Albertine Luise von Jakob, daughter of a distinguished professor at Halle (see ROBINSON, THERESE); returned to the U. S., and was professor extraordinary at Andover 1830–33; broke down in health, and resided in Boston 1833–37; was professor in Union Theological Seminary, New York, from 1837 till his death Jan. 27, 1863. In 1838, and again in 1852, he traveled in Palestine with Rev. Eli Smith, the learned missionary. Besides the works already mentioned, he published Taylor's *Calmet* (1832); *A Dictionary of the Bible for the use of Schools and Young Persons* (1833); Buttman's *Greek Grammar* (1833; 2d ed. 1839; 3d ed. 1851); Gesenius's *Hebrew Lexicon* (1836; 5th ed. 1854); *Greek and English Lexicon of the New Testament* (1836; 2d ed. 1847); *Greek Harmony of the Gospels* (1845; 2d ed. 1851); *English Harmony of the Gospels* (1846); *Memoir of the Rev. William Robinson* (1859). In 1831 he founded *The Biblical Repository*, which he edited for four years, and in 1843 the *Bibliotheca Sacra*, for which he continued to write till 1855. His greatest work was *Biblical Researches* (1841, 8 vols.; compressed into two, and a third added 1856), for which, in 1842, he received the gold medal of the Royal Geographical Society. He also received the degree of D. D., previously (1831) conferred by Dartmouth College, from the University of Halle in 1842, and that of LL. D. from Yale College in 1844. His *Physical Geography of the Holy Land* was edited by Mrs. Robinson in 1864, and published in 1865. See *The Life, Writings, and Character of Edward Robinson*, by R. D. Hitchcock (New York, 1863).

**Robinson, Sir FREDERICK PHILLIPSE:** soldier; son of Col. Beverley Robinson; b. on the Phillipse Manor, New York, in Sept., 1763; became an ensign in his father's Loyal American Regiment Feb., 1777; was wounded and taken prisoner at Stony Point; served in the West Indies, and with great distinction under Wellington in the Peninsular war, rising to be general; was commander-in-chief of the British forces in Canada 1812; participated in the campaign on Lake Champlain Sept., 1814; was knighted 1815; was governor of Upper Canada 1815–16; removed to the West Indies, where he commanded the forces; became full general 1841. D. at Brighton, England, Jan. 1, 1852.

**Robinson, HENRY CRABB:** lawyer and man of letters; b. at Bury St. Edmunds, England, May 13, 1775; was articled to a lawyer at Colchester, and afterward in London; studied several years (1800–05) at Jena and other German universities, where he acquired a very thorough knowledge of mod-

ern German literature and philosophy; enjoyed the intimate friendship of Goethe, Wieland, Schiller, the Schlegels, and other eminent people; furnished data to Madame de Staël for her work on Germany; was correspondent of *The Times* in Spain at the beginning of the Peninsular war 1808–09; was engaged on his return to London as a regular writer for that journal; was called to the bar at the Middle Temple 1813; became a highly successful and prosperous lawyer on the Norfolk circuit, from which he retired with a fortune in 1828, and for the remainder of his life devoted himself to society and literary leisure, being prominently known as the intimate friend of Wordsworth, Blake, Clarkson, Flaxman, Lamb, Coleridge, Southey, and their compeers. He was one of the first members of the Athenæum Club, one of the founders of University College, London, and of the Flaxman Gallery, to which latter institution he left liberal bequests. D. in London, Feb. 5, 1867. He published little, but left a copious *Diary and Correspondence*, from which interesting selections were published in 1869. Revised by H. A. BEERS.

**Robinson, JOHN:** clergyman; b. in England, probably in Lincolnshire, 1575; entered Cambridge University 1592; pursued his studies in Corpus Christi College, and there became attached to Puritan doctrines; took preliminary orders in the Church of England; obtained a benefice near Great Yarmouth, Norfolk; was suspended by the bishop for non-conformity in ecclesiastical ceremonies 1602; gathered an Independent congregation at Norwich; formally separated from the Church of England 1604; resigned his fellowship at Cambridge; became assistant, and soon after sole, pastor of a Dissenting congregation (1604) gathered at Scrooby, Nottinghamshire (near the borders of Yorkshire and Lincolnshire), where the Brewsters, Bradfords, and Mortons were among his flock; suffered a persecution which led many of his congregation to emigrate with him to Amsterdam, Holland, 1608; removed to Leyden 1609; gathered there a numerous church, constantly re-enforced by arrivals from England; attended lectures at the university, of which he afterward became a member; held a public discussion with the Dutch professor Episcopius, the successor of Arminius, upon the Calvinistic doctrine of predestination, 1613; entered into the plans for colonization in New England about 1617; was active in promoting the negotiations, through Cushman, Carver, and Brewster, with the Plymouth Company of capitalists; dismissed a portion of his congregation with a memorable sermon on their embarkation for America July 22, 1620, intending to follow them the next year; but before the negotiations were completed he died at Leyden about Mar. 1, 1625. He was buried in St. Peter's church, the members of the university and the ministers of the city attending his funeral. Among his numerous controversial publications were *A Justification of Separation* (1610); *Of Religious Communion* (1614); *Apologia Justa et Necessaria* (1619); *A Defense of the Doctrine propounded by the Synod of Dort* (1624); *Essays or Observations, Divine or Moral* (1628); *A Treatise of the Lawfulness of Hearing of the Ministers in the Church of England* (1634); and *An Apology for Certain Christians no less conterminously than commonly called Brownists or Barrowists*. His complete Works, with a memoir, appeared in London and Boston in 3 vols., 1851. In 1891 a bronze tablet to his memory, placed on an outer wall of St. Peter's, was dedicated by representatives of the National Council of the Congregational Churches of the U. S. Revised by G. P. FISHER.

**Robinson, JOHN CLEVELAND:** soldier; b. at Binghamton, N. Y., Apr. 10, 1817; entered the U. S. Military Academy 1835, but without graduating began the study of law in 1838. In 1839, however, he accepted a second lieutenancy in the Fifth Infantry, and served in the war with Mexico and in Florida against the Indians. In Sept., 1861, he was appointed colonel of the First Michigan Volunteers, and in Apr., 1862, brigadier-general of volunteers, serving in command of a brigade with the Army of the Potomac in the Virginia peninsular campaign of 1862, at the second battle of Bull Run, Chantilly, and Fredericksburg. At Gettysburg and in the Richmond campaign of 1864 he commanded a division with great bravery, losing a leg on the fourth day of fighting in the latter campaign, near Spottsylvania Courthouse, while leading the advance of the army; was appointed brevet brigadier-general and major-general for gallantry. In 1866 he attained the colonelcy of the Forty-third Infantry, and in 1869 was retired from active service on the full rank of major-general. In 1872 he was elected Lieutenant-Governor of the State of New York, and in 1894

we should know more than we do of what graphic art is capable. The best and best-preserved specimen of his historical or descriptive work is the *Miracle of St. Mark*, in the Academy at Venice, which is splendid and deeply satisfying in color, while full of strenuous action; and if its composition in line and mass is not altogether of the highest order, it only misses this excellence by a little. Still, for many art lovers, such smaller and more simple pictures, as the *Death of Abel*, mentioned above, or the *Bacchus and Ariadne*, or the *Pallas defending Peace and Abundance*, in the Anticollégio of the ducal palace, or even the not uncommon portraits of robed senators, are more precious than the large pictures of action.

Little is known of the details of this artist's life, for it was filled with hard work in Venice, which city he seldom left. The work in the Scuola di San Rocco was begun in 1560, and soon after this time his first paintings in the ducal palace were undertaken. After the fire which destroyed half the palace in 1577 he undertook other works there, and the San Rocco work was also continued during all those years. The great *Paradise* was painted about 1586. D. at Venice, May 31, 1594.

Of his numerous pictures the following may be mentioned: In the Scuola di San Rocco, eight large pictures on the walls of the lower hall, thirteen on the walls of the upper hall, and thirteen on the ceiling of the same, all of biblical subject except two or three, which deal with the legend of St. Roch (S. Rocco); also, in the Albergo, *The Crucifixion* and another large picture. In the ducal palace, ten historical pictures, besides the great *Paradise*, on the wall of the Greater Council, and, in the smaller halls of the upper story, fifteen large pictures, mostly of Venetian historical and emblematic subject with several mythological subject and two of the Bible history, besides many portraits. In the Academy of Fine Arts, besides the three already named, there are a *Crucifixion with the Three Marys*, a *Descent from the Cross*, a *Virgin and Child*, each of these having portraits of Venetian nobles introduced, an *Assumption of the Virgin and Mary*, and portraits of extraordinary value. In the Church of Madonna del Salute is *The Marriage of Cana*, a noble work. In the Madonna dell' Orto are the pictures described above and three others, of which the *Last Judgment* has been much described and commented on. In the Carmini, or Church of the Carmelite friars, is a *Presentation in the Temple*. In S. Giorgio Maggiore are the *Last Supper*, *The Israelites gathering the Manna*, and several other important pictures. Perhaps a dozen other churches in Venice have works which should be studied. Pictures of his hang in the galleries of the Uffizi and the Pitti Palace at Florence, in the British Museum, in the Old Pinakothek at Munich, in the Louvre, and in the National Gallery of London.

Little has been published about Robusti except the notices in biographical dictionaries and guide-books, probably because the interest of his career lies in his art alone. A biography by W. R. Osler in the Great Artist Series was published in 1879. See Janitschek, *Kunst und Künstler*.

RUSSELL STURGIS.

**Roby, HENRY JOHN**: educator; b. at Tamworth, England, Aug. 12, 1830; graduated at Cambridge 1853; became fellow of St. John's College 1854; was assistant tutor 1855-56, and reappointed 1860; was university examiner in law, classics, and moral sciences 1859-61; member of, and secretary to, the local examination syndicate 1858-59; took a prominent part in urging university reform; was assistant master of Dulwich College 1861-65; Professor of Jurisprudence at University College, London, 1866-68; was appointed by the crown secretary to the schools inquiry commission Dec., 1864, to the endowed schools commission Aug., 1869, and was a member of that body 1872-75. He was elected member of Parliament for Eccles Oct., 1890. He edited the *Report of the school commissioners* and the numerous volumes of documents thereto appended (Mar., 1868); author of an *Elementary Latin Grammar* (1862; 2d ed. 1882); and a valuable *Grammar of the Latin Language, from Plautus to Suetonius* (3 vols., 1871-74; 5th ed. 1887); *Introduction to Study of Justinian's Digest* (1884).

Revised by BENJ. IDE WHEELER.

**Roca, JULIO A.**: general and statesman; b. at Tucuman, Argentine Republic, July, 1843. He studied in the military school at Paraná, joined the army, and became general in 1874. He was Minister of War under President Avellaneda 1878-80, and in this capacity headed the expedition by which

the Indians of Patagonia were finally reduced to subjection. Succeeding Avellaneda, he was president Oct. 12, 1880, to Oct. 12, 1886. Specie payments were suspended in 1885, marking the beginning of the great Argentine crisis which soon after convulsed the financial world. H. H. S.

**Rocafuerte, rō-kā-fwärtā, VICENTE**: statesman; b. at Guayaquil, Ecuador, May 3, 1788. He was educated in France and England, where he derived republican ideas from Miranda, Bolívar, and their associates. In 1812 he was elected deputy for Guayaquil to the Spanish Cortes. After his country became a part of Colombia he held diplomatic positions in North America and Europe, and he resided several years in Mexico, where he was a prominent journalist. Returning to Guayaquil in 1833 he was elected to congress, but his liberal opinions caused him to be exiled. The same year the liberals revolted at Guayaquil and proclaimed him supreme chief, but he was defeated and captured by Flores. The latter magnanimously offered to co-operate with him in the reorganization of the republic, and under this arrangement Rocafuerte was president from 1835 to 1839. This period was the most prosperous in the history of Ecuador, and the president won universal respect. Subsequently he held various civil and diplomatic positions. He published many works on political subjects. Rocafuerte was unquestionably the greatest statesman of Ecuador. D. at Lima, Peru, May 10, 1847. HERBERT H. SMITH.

**Roc'amboule** [= Fr., from Germ. *rockenbolle*, rocambole, liter., rye-bulb; so called because it grows among rye]: the *Allium scorodopraeum*, a plant of the garlic family, much resembling garlic, but larger and milder. It is cultivated in European kitchen-gardens, and is a native of northern regions.

**Rochambeau, rō'shān'bō', JEAN BAPTISTE DONATIEN DE VIMEUR**, Count de: marshal of France; b. at Vendôme, France, July 1, 1725; entered the army 1742; was distinguished in the campaigns of the Seven Years' war; was made lieutenant-general Mar. 1, 1780; commanded the French forces in the U. S. during the war of independence 1780-82; took a prominent part in the campaign of Yorktown 1781; became governor of Picardy 1783; was made marshal 1791; commanded the Army of the North from Mar. to June, 1792; was imprisoned during the Reign of Terror, and escaped the guillotine only through the death of Robespierre; was appointed by Napoleon, when First Consul, grand officer of the Legion of Honor (1804). D. at Thoré, May 10, 1807. His *Mémoires* were published in 1809, and translated into English in 1838.

**Rocha Pitta, SEBASTIÃO, da**: author; b. at Bahia, Brazil, May 3, 1660; educated at Bahia and at Coimbra, in Portugal, he married early and settled on his property, living a life of studious leisure. He wrote there some mediocre verse and a now forgotten romance. Late in life he determined to write a history of Brazil, and undertook the most extensive preparations for the task. He even went to Lisbon in search of documents. In 1728 he completed the work, calling it *Historia da America portugueza desde o seu descobrimento até o anno 1724* (Lisbon, 1730). His success was great, and brought him many honors. His last years were spent in retirement on his estates near Cachoeira, Brazil. D. Nov. 3, 1738. His book was the first real history of Brazil, and though he was often over-credulous in his use of documents, he gathered a vast mass of material for his successors. A. R. MARSH.

**Rochdale**: town; in Lancashire, England; on both sides of the Roch; 11 miles N. by E. of Manchester (see map of England, ref. 7-G). St. Chad's parish church (twelfth century, restored 1885) is a Perpendicular building, approached by a flight of 122 steps. The town-hall (1866-71) is a fine example of the Gothic style. Rochdale has large manufactures of woolen goods, such as baize, flannels, blankets, and kerseys, cotton goods, especially calicoes, and iron and steel ware. It is distinguished as having made the first successful attempt at Co-OPERATION (q. v.). It returns one member to parliament. Pop. of parliamentary borough (1891) 71,401.

**Rochefort, rōsh'fōr', or Rochefort-sur-Mer, -sūr-mār'** (anc. *Rupifortium*): town; in the department of Charente-Inférieure, France; on the right bank of the Charente, 9 miles from its mouth. It has a port and a naval arsenal, is surrounded by walls and ramparts planted with trees, and is defended by forts at the entrance into the river (see map of France, ref. 6-D). Outside is a roadstead protected by the

(see ROCHESTER, UNIVERSITY OF) has taken high rank among the colleges of the U. S. There is also a flourishing Baptist Theological Seminary which maintains a German as well as an English department. The Western New York Institute for Deaf Mutes has achieved a worldwide reputation by its improved methods of instruction; and the Mechanics' Institute is placing technical instruction and familiarity with the homelier arts of life within reach of the masses. There is a young but vigorous Historical Society, and an Academy of Science. There are 38 public schools, 7 schools connected with orphan asylums but supported and supervised by the city, and a Free Academy, in all of which 19,250 pupils are instructed by 631 teachers, at an expense of \$29.63 per annum for each pupil. It is estimated that 8,000 pupils attend the parochial and other private schools. In the Free Academy building there is a public library of 22,000 volumes; in the court-house there is a valuable law library of 15,000 volumes; the Reynolds Free Library contains 30,000 volumes, and is especially complete in books of reference; the library of the university contains 28,000 volumes, and that of the Theological Seminary 28,000 volumes.

**Public Institutions.**—There are four hospitals (City, St. Mary's, Homœopathic, and Hahnemannian) with spacious buildings, capable of providing for 700 patients. The State Industrial School is situated in the northern part of the city, and occupies an inclosure of 42 acres, on which there are nine large buildings. Juvenile offenders are received from all parts of the state except New York and Kings County, and the school numbers about 650 boys and 150 girls. The Monroe County penitentiary, almshouse, and asylum for the insane are situated just S. of the city. Mt. Hope Cemetery, one of the oldest of its kind in the U. S., was established 1838, has a naturally beautiful site, and has been laid out with much care and taste. The Catholic Cemetery of the Holy Sepulchre, established 1872, is located on a fine site of 140 acres upon the river bank N. of the city. A gas and electric company, with a capital of \$4,300,000 and 200 miles of mains, supplies the city with light. The Rochester Street-railway Company, with a capital of \$5,000,000, maintains 13 lines of electric cars, with a trackage of 85 miles. A magnificent system of water-works was constructed in 1874, with two sources of supply—one from the river, the water being forced through 10 miles of mains in the business center by the Holly patent, and used for suppressing fires and running light machinery; the other from Hemlock Lake, 29 miles S. and 400 feet above the city. The water from this source is distributed through 252 miles of mains, which can furnish 22,000,000 gal. daily. The total cost of the system to 1895 was \$7,000,000.

**Business Interests.**—There are in Rochester 10 banks of discount, with a capital and surplus of \$4,500,000 and deposits of over \$15,000,000; 4 savings-banks and 2 trust companies, with deposits of over \$30,000,000 and a surplus of over \$3,500,000. Owing to the surpassing fertility of the Genesee valley and its fine water-power, flour was formerly the chief product of Rochester. There are still 17 flouring-mills in operation, with an aggregate capacity of 5,000 barrels a day. The nursery business has, however, become of far more importance, and in this line Rochester outranks every other city. In the manufacture of clothing Rochester ranks third among the cities of the U. S., with an annual output of \$13,000,000. In the manufacture of shoes it ranks fourth. Thirteen breweries send out 700,000 barrels of beer per annum. A single tobacco-factory employs 450 hands, and the value of the city's output in that line of business is \$4,500,000. The largest carriage-factory in the U. S., employing 800 hands, is situated here. The kodak camera business originated here, and there is \$5,000,000 invested in it. Several large establishments are engaged in the manufacture of perfumery. Rochester locks, microscopes, and vacuum oil-products have a worldwide celebrity, and contribute much to the prosperity of the city. According to the U. S. census of 1890 Rochester had 1,892 manufactories, employing 37,720 persons, and yielding products valued at \$65,091,156. From its proximity to the coal-fields of Pennsylvania, it has become a great distributing center for coal, which is loaded from railways on the banks of the river into vessels that convey it to all points on the lakes. In 1890 Rochester ranked sixth in exports and fourth in imports of the lake ports of the U. S.

**History, etc.**—The first house was erected in 1812, and the place was incorporated as the village of Rochester ville in 1817 and as a city in 1834. From the first there has been a steady growth in wealth and population, which lately,

through the influence of an energetic chamber of commerce, have increased with phenomenal rapidity. There are 36,000 dwellings within the twenty wards of the city. The assessed valuation is \$100,000,000. From the "Rochester rappings" (1848-49) the city may be regarded as the birthplace of modern Spiritualism; it was also the center of the anti-Masonic excitement (1827-29).

Pop. (1820) 1,500; (1880) 89,366; (1890) 183,896; (1892) 144,834.

J. H. GILMORE.

**Rochester:** borough; Beaver co., Pa.; at the confluence of the Ohio and Beaver rivers, and on the Pitts., Ft. Wayne and Chi. and the Cleve. and Pitts. railways; 26 miles N. W. of Pittsburg (for location, see map of Pennsylvania, ref. 4-A). It is in a fire-clay, coal, oil, and building-stone region, and is connected by electric street-railway with New Brighton, Beaver, and Beaver Falls, and by a bridge across the Beaver river with Bridgewater. There are 11 churches, 2 graded public schools, 2 hotels, 22 societies and lodges, Masonic temple, a national bank with capital of \$50,000, a private bank, and a weekly newspaper. The manufactures include tumblers, bottles, stoves, brick, flour, and lumber. Pop. (1880) 2,552; (1890) 3,649; (1894) estimated, 4,000.

EDITOR OF BEAVER "ARGUS AND RADICAL."

**Rochester, JOHN WILMOT, Earl of:** b. at Ditchley, Oxfordshire, England, Apr. 10, 1648; succeeded to the title 1659. He became a favorite at the court of Charles II.; wrote poems in accordance with the prevailing taste; was famous for his wit and infamous for his vices. He had Dryden beaten by a gang of hired bullies in 1679 in revenge for a passage lampooning Rochester in Dryden's alleged *Essay on Satire*. His death-bed repentance was described by Bishop Burnet in a pamphlet which had an extraordinary sale. D. July 26, 1680. His *Poems and Familiar Letters* were posthumously published. See his *Life*, by Dr. Johnson.

Revised by H. A. BEERS.

**Rochester, University of:** a college established at Rochester, N. Y., in 1850. At that time the whole of Western New York was without any important institution of this kind. The founders were principally Baptists, although the charter contains no denominational restriction. The university has had two presidents, Martin B. Anderson, LL. D., L. H. D., who served from 1853 to 1888, and David J. Hill, LL. D., who was elected in 1888. Among the local benefactors have been Hiram Sibley, who gave \$100,000 for the erection of Sibley Hall, a fire-proof building containing the library and museum; Mortimer F. Reynolds, who built a chemical laboratory; and Don Alonzo Watson, who established a professorship in history and political science with an endowment of \$50,000. The original campus, afterward enlarged to 24 acres, was the gift of the Hon. Azariah Boody. The assets of the university in 1894 were \$1,203,077.44, of which \$689,842.84 was invested in productive funds yielding an annual income of \$35,179.37, and the remainder, \$513,234.60, in buildings, books, and appliances. In 1894 the faculty was composed of 17 professors and instructors, and the students numbered 212. There are four courses of study leading to a degree, embracing 100 courses of instruction. The library contains nearly 30,000 bound volumes, and several thousand pamphlets. The reputation of the institution has rested chiefly upon the character of its work as a classical college, but within recent years the natural sciences have occupied a larger place in the curriculum, and laboratories have been opened in chemistry, biology, physics, and geology. The geological museum is one of the finest in the U. S., being the original Ward collection amplified.

DAVID J. HILL.

**Rochet, rō'shā', Louis:** sculptor; b. in Paris, Aug. 24, 1818; studied under Pierre Jean David, called David d'Angers, and began to exhibit in 1835, his first statue being a *Boy extracting a Thorn from his Foot*. Among his most prominent works are the *Statue of Marshal Drouet*, at the Versailles Museum; *William the Conqueror*, a statue at Palais in Normandy; a life-size statue of *Napoleon*, and another *Napoleon as a Scholar at Brienne* (1853); *Madame de Sévigné*, at Grignan (1857); a colossal equestrian statue of Pedro I., at Rio de Janeiro (1861); and a similar statue of Charlemagne (1867). D. in Paris, Jan. 21, 1878.

**Rock-butter:** See BUTTER.

**Rock-crystal:** See QUARTZ.

**Rocker:** an instrument used in mezzotint engraving. See ENGRAVING (*Mezzotint*).

**Rocket:** See DYERS' WEED.

Ann, known as Pigeon Cove, is a popular summer resort. The town has a public high school, public library, national bank with capital of \$100,000, a savings-bank, a weekly newspaper, and manufactories of cotton goods, isinglass, shoes, and organs. The new post-office in Boston was built of Rockport granite. Pop. (1880) 3,912; (1890) 4,087.

**Rockport:** town; capital of Aransas co., Tex.; on Live Oak Point peninsula in Aransas Bay, Gulf of Mexico, and on the San Ant. and Aran. Pass Railway; 10 miles N. E. of Aransas Pass (for location, see map of Texas, ref. 7-I). It is in an agricultural, fruit-growing, and stock-raising region; has considerable oyster, fish, and turtle interests, exports large quantities of cattle and hides, and is a popular summer and winter health resort. There are several large hotels, a national bank with capital of \$60,000, and two weekly newspapers. The vicinity abounds in wild game of many varieties. Pop. (1880) not separately returned; (1890) 1,069; (1893) estimated, 1,500.

**Rock Rapids:** town (founded in 1872); capital of Lyon co., Ia.; on the Rock river, and the Chi., St. P., Minn. and Omaha, the Burl., Cedar Rap. and N., and the Ill. Cent. railways; 22 miles W. of Sibley, 60 miles N. of Sioux City (for location, see map of Iowa, ref. 2-C). It is in an agricultural and stock-raising region, has good water-power for manufacturing, and contains 5 churches, several graded public schools, a national bank with capital of \$50,000, a private bank, and 2 weekly newspapers. Pop. (1890) 1,394; (1894) estimated, 2,500.

**Rock-roses:** See *Cistus*.

**Rocks** [M. Eng. *rokke*, prob. blending O. Fr. *roke* (> Fr. *roche*, rock) and O. Eng. *\*rocc* in *stōn-rocc*, stone-rock]: natural masses of solid mineral matter. The term is used in various ways. Popularly and in general literature a rock is characterized as hard and unyielding, and is placed in antithesis to sand, clay, or mud, and in almost all instances where it is used in a figurative sense this is the prominent idea. Modern geological usage extends the term so as to embrace any natural mass of solid mineral matter, whether compact or incoherent. Thus granite, limestone, sandstone, chalk, and deposits of sand, clay, and soil are all considered under the general head of rocks. A third usage arises from the closer discriminations of petrography, which has in effect defined a rock as any natural mass of solid mineral matter that possesses nearly uniform structure, texture, and composition. Thus masses which may have like composition but different structure and texture are called different rocks, viz., granite, gneiss, porphyry, rhyolite, etc.; and rocks with similar textures but with different compositions are different rocks, as granite, diorite, gabbro. A fourth usage springs from the petrological idea of the individuality of a rock-mass as a geological body which has been brought into place by one act, as a continuous lava-stream, or which is the result of the continued action of any set of forces upon a given kind of material, as a continuous bed of sand and gravel. One rock-body may consist of several kinds of rocks, as a stratum whose basal portion is conglomerate and upper portion sandstone; a lava-stream which is partly rhyolite, obsidian, and pumice. The language has not yet discriminated between these ideas, hence the uses of the term rocks are confusing.

**Formation of Rocks.**—Conclusions regarding the formation of rocks are partly a matter of observation, partly a matter of inference. 1. Lavas flow out from craters and crevices in the earth in a highly liquid condition and, upon cooling, solidify into rocks. Similar material is thrown into the air in dust-like particles and larger fragments, and accumulates upon the surface in more or less compacted masses, as tuffs, breccias, etc.; or the lavas may remain within fissures and openings in the earth's crust where their solidification can not be observed. Similarity in composition and analogies in texture and in mineralogical characteristics between surface lavas and intratellural rock-bodies, as well as their disposition toward surrounding rocks, permit logical inferences to be drawn regarding the original nature of intratellural bodies as molten lavas or magmas. All such rocks are classed as *igneous* or *eruptive*. 2. Sand, silt, and soil are washed down slopes by water and carried along by streams, or as sand and dust are blown about by winds to be deposited when the force of the current lessens. They accumulate in layers or beds, horizontal or inclined, and by drying or cementation may become more or less coherent masses. Mineral springs deposit layers of calcium-carbonate, silica, etc., sometimes acquiring great thickness. These observed proc-

esses result in the formation of rocks similar in composition, texture, and structure to others whose formation may be inferred to have been occasioned by similar agencies. All such deposits are known as *sedimentary* rocks. 3. Alterations in rocks of the two first categories may affect their composition, texture, or structure. Changes that cause the rock to disintegrate are classed as weathering or decomposition. Changes that convert it into a mass still possessing great durability are classed as metamorphism. Such metamorphism may be occasioned by heat, by solutions, or by dynamic forces, and the results may be recrystallization, the production of new minerals, fracturing, and rearrangement of the fragments. All rocks resulting from the metamorphism of igneous or sedimentary rocks, and those resembling them whose original nature may not be determinable, are called *metamorphic* rocks. See **METAMORPHISM**.

**IGNEOUS** or eruptive rocks which solidified on or near the surface of the earth are called *volcanic*, if considerably below the surface *plutonic* or *abyssal*. If lavas reached the surface they are *extrusive* or *surface lavas*, if not they are *intrusive*. The latter often metamorphose adjacent rocks by heating or by impregnation with hot solutions and vapors, and in turn often exhibit modifications in structure, texture, and composition resulting from cooling produced by surrounding rocks. Intrusive igneous rocks form dikes, sheets, laccolites, batholites, stocks, or necks. Extrusive rocks form lava streams and sheets, domes, breccias, agglomerates, and tuffs. The last may be stratified and bedded, and if deposited in water are not distinct from sedimentary rocks.

**Chemical and Physical Characters.**—All igneous rocks consist of oxygen, silicon, aluminium, with sodium and potassium, or calcium, magnesium, and iron in variable proportions. Usually all eight are present. Besides these elements are small amounts of titanium, phosphorus, hydrogen, and often traces of manganese, nickel, cobalt, lithium, barium, strontium, chlorine, sulphur. These are usually expressed in analyses as oxides, but are mostly combined in silicate minerals, together with some that are oxides. The molten magmas must be considered as solutions of compounds of these elements at high temperatures, their exact molecular character being unknown. Those with more than 65 per cent. silica are called acid magmas; those between 65 and 55 per cent. silica, intermediate; and those with less than 55 per cent. silica, basic. The extreme limits are about 80 and 35 per cent. silica. Molten magmas are often very liquid at the time of eruption, especially those with less than 60 per cent. silica. The more siliceous ones are more viscous at like temperatures. As the temperature falls the magmas become more viscous, and crystallization usually sets in. If cooling is very sudden, the magma forms an amorphous mass (glass) without crystals. With slower cooling crystals form more or less perfectly, their shape and chemical composition depending upon the physical as well as the chemical condition of the magma, molecular shifting and arrangement being more easily accomplished in more liquid magmas, which, however, must be below the fusion-point of the minerals crystallizing. Slowest cooling permits most perfect molecular adjustment, resulting in fewer but larger crystals. Other agencies affecting crystallization are absorbed vapors, and possibly pressure. The size and arrangement of the crystals control the texture of the rock, which may be glassy or *vitreous*, stony or *lithoidal* and *crystalline*. When the grains are visible to the naked eye the texture is *phanerocrystalline*; if not, then *aphanitic*. Rocks are *porphyritic* when they consist of a groundmass of any texture bearing larger, prominent crystals (*phenocrysts*). Particular textures have special names, as *granitic*, *poikilitic*, *ophitic*, *trachytic*, *rhyolitic*, etc. Structures due to the physical continuity of the mass are *compact*, *porous*, *vesicular*, *pumiceous*, *jointed*, *columnar*, *laminated*, etc. The commonest minerals that crystallize from molten magmas (pyrogenetic) are quartz, potash-feldspar or orthoclase, lime-soda-feldspars, the feldspathic minerals (nepheline, leucite, and sodalite), and certain ferromagnesian minerals (amphiboles, pyroxenes, micas, and olivines) among others are titanite, magnetite, ilmenite, apatite, zircon, and less often garnet, tourmaline, allanite, and spinel. Minerals prominent in the most acid rocks (granites) are quartz, alkali (potash, soda) feldspars; less abundant lime-soda-feldspars, with muscovite, biotite, and hornblende. As we pass to less acid rocks quartz diminishes; feldspars increase to a certain point, and then diminish and disappear in the most basic rocks (peridotites). Alkali-feldspars increase

between layers of schist, and have so nearly identical mineralogical composition and characters that they are generally considered together, and the whole series is classified on a basis of mineral composition—that is, rocks having similar mineral constituents are grouped together with little or no regard to the relative proportions of these minerals. At present this seems justifiable because of the lack of constancy in the composition of any considerable body of metamorphic rock, and because of the abrupt and frequent changes in the proportions in which the minerals occur together. The principal kinds of metamorphic rocks are—

I. *Feldspar-quartz Rocks* are those rocks whose predominant minerals are feldspar and quartz. They include:

*Gneiss*, a crystalline rock composed of potash-soda-feldspar and lime-soda-feldspar with quartz, and one or more minerals of the mica, amphibole, pyroxene groups, besides other minerals, and having a banded or laminated structure, produced by the parallel arrangement of some of the mineral constituents. It varies from quite massive forms to finely schistose ones. It bears a close analogy to granite in texture and composition, in some cases being scarcely distinguishable from it. When lime-soda-feldspars predominate over alkali-feldspars, the rock corresponds closely to quartz-diorite. According to the ferro-magnesian mineral prevalent, gneisses are subdivided into mica-gneiss (biotite, muscovite, or both), hornblende gneiss, augite gneiss, sericite-gneiss, etc.

*Granulite*, schistose rock consisting of feldspar, quartz, and garnet, with other minerals subordinate, according to which the rock is subdivided into cyanite-granulite, tourmaline-granulite, etc.

*Häfeintia* and *Adinole*, dense, aphanitic or felsitic rocks, composed of minute particles of feldspar and quartz, and sometimes mica.

II. *Mica-rocks, chlorite-rocks, or talc-rocks* are:

*Mica schist*, laminated rock consisting of mica and quartz in variable proportions. According to the kind of mica, or of the other prominent constituents, they are muscovite-schist, biotite-schist, sericite-schist, paragonite-schist, and numerous other mica-schists depending on the accessory mineral, as staurolite, andalusite, epidote, etc. With increase of quartz it passes into micaceous quartzite; with more feldspar, into gneiss; with calcite, into micaceous limestone.

*Chlorite-schist*, laminated rock composed of chlorite and quartz, with other minerals subordinate.

*Phyllite, Argillaceous Schist, Argillite*, micaceous, argillaceous, schistose or slaty rock intermediate between clay-slate and mica-schist. Subdivisions are chiastolite-slate, staurolite-slate, ottrelite-slate, sericite-phyllite, etc.

*Talc-schist*, laminated rock composed of talc, with quartz or feldspar and other minerals.

III. *Amphibole-rocks*.—Rocks whose predominant mineral is amphibole, either schistose or massive; the former is *amphibole-schist*, the latter *amphibolite*. With amphibole may be associated feldspar, quartz, garnet, etc. According to the variety of amphibole present the rock is hornblende-schist, or hornblende, actinolite-schist, glaucophane-schist. Nephrite, a variety of jade, is a compact microfibrinous variety. Subdivisions are also established upon the character of the accessory mineral, as epidote-amphibolite, etc. When lime-soda-feldspar becomes prominent, the rock grades into diorite-schist; by increase of quartz and feldspar, into gneiss.

IV. *Pyroxene-rocks* are augite-schist, when laminated; augite, when massive; enstatite-rock, jadeite (jade). As lime-soda-feldspar increases, and the augite becomes more like diallage, the rock passes into schistose gabbro.

V. *Other rocks* are eclogite, crystalline massive rock, seldom schistose, composed of omphacite (light-green pyroxene), and garnet, with other minerals subordinate. Olivine-rocks are essentially olivine, with pyroxenes, hornblende, or mica in varying amounts, corresponding closely in mineral composition to the peridotites.

Epidote-schist and tourmaline-schist are schists in which epidote and tourmaline are prominent minerals, in combination with others less characteristic. Greenstone-schists are schistose and green, and generally very fine-grained. The color is due to fibrous amphibolite (actinolite), chlorite, or serpentine with epidote, combined with other minerals.

*Quartz-rocks* are chiefly composed of quartz, quartzite when massive, quartz-schist when schistose, usually with mica.

*Calcite-rocks* are crystalline limestone and *MARBLE* (q. v.).

**BIBLIOGRAPHY.**—General works on rocks are: Rutley, *The Study of Rocks* (London, 1879); Roth, *Allgemeine chemische Geologie* (Berlin, 1879, et seq.); Jannetaz, *Les roches* (Paris,

1884); von Lasaulx, *Einführung in die Gesteinslehre* (Breslau, 1886); Kalkowsky, *Elemente der Lithologie* (Heidelberg, 1886); Zirkel, *Lehrbuch der Petrographie* (2d ed., 3 vols., Leipzig, 1884); also Dana, *Manual of Geology* (latest edition); Dana, *Manual of Mineralogy and Petrography* (4th ed.; New York, 1887); and Geikie, *Text-book of Geology* (3d ed.; London and New York, 1893). Works treating of the microscopical characters of rocks and of the rock-making minerals include a part of those just noted, and the following: Rosenbusch, *Mikroskopische Physiographie der Mineralien und Gesteine* (2 vols.: vol. i., 3d ed. 1892; vol. ii., 2d ed. 1887, Stuttgart; vol. i., translated by J. P. Iddings, *Microscopical Physiography of the Rock-making Minerals*, New York, 3d ed. 1893); Fouqué and Michel Lévy, *Minéralogie micrographique des roches éruptives françaises* (3 vols., Paris, 1879); Teall, *British Petrography* (London, 1888); Zirkel, *Microscopical Petrography* (vol. vi. of *Geol. Explor. of 40th Parallel*, Washington, 1876); Hawes, *Mineralogy and Lithology of New Hampshire* (part iv. of *Geology of New Hampshire*, Concord, 1878); Wadsworth, *Lithological Studies* (part i., Cambridge, Mass., 1884); Lehmann, *Entstehung der alkrySTALLINISCHEN Schiefergesteine* (Bonn, 1884); Williams, *Greenstone Schist Areas of the Menominee and Marquette Region of Michigan* (Bull. 62, U. S. Geol. Survey, Washington, 1890).

JOSEPH P. IDDIGES.

**Rock-salt:** See SALT.

**Rock-snake:** See BONGAR.

**Rock Springs:** town; Sweetwater co., Wyo.; on the Bitter creek, and the Union Pac. Railway; 258 miles W. of Laramie (for location, see map of Wyoming, ref. 12-G). It is in an extensive coal-mining region, and has 2 national banks with combined capital of \$110,000, and 2 weekly newspapers. Pop. (1880) 763; (1890) 3,406.

**Rockville:** city (set off from the town of Vernon and chartered as a city in 1889); Tolland co., Conn.; on the Hockanum river, and the N. Y. and N. Eng. Railroad; 10 miles E. N. E. of Hartford (for location, see map of Connecticut, ref. 7-I). The river, which is the outlet of Lake Suisun, has here a series of falls aggregating 280 feet, and affords abundant power for manufacturing. The principal industry is the manufacture of envelopes; other important articles made here are woolen goods, silk goods, satinetts, gingham and warps. There are 8 churches, a public library, 2 national banks with combined capital of \$500,000, 2 savings banks with aggregate deposits of over \$1,750,000, and 1 weekly newspapers. Pop. (1880) 5,902; (1890) 7,772.

**Rockweeds:** the popular name of the brown seaweeds of the genera *Fucus* and *Ascophyllum*, common on rocks between tide-marks along the U. S. coasts. See FUCOID.

**Rockwood:** town; Roane co., Tenn.; on the Queen and Cresc. Route and the Rockw. and Tenn. Rivers railways; 6 miles N. of the Tennessee river, 45 miles W. S. W. of Knoxville (for location, see map of Tennessee, ref. 6-II). It is in a coal and iron mining region, and contains several blast furnaces, a national bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 1,011; (1890) 2,429.

**Rocky Mountain Goat** [so called on account of its goat-like appearance]: a species of antelope (*Mazama montana*

Rocky Mountain goat.

with short legs, round, black, decurved horns, long, white woolly hair, and a short beard on the chin. It is very much

the ranges coalesce. Of the age of the dry land there is no certain knowledge, but the mountain forms due to upheaval and atmospheric degradation, and also the mountain forms due to extravasation, are of very late geological origin.

There are about 100 ranges in this group. The highest, broadest, and most massive is the Wasatch. In this are found the principal geological formations of the other ranges of the system, and also some of the sedimentary beds of the Plateau System. The escarpment faces the W., and the highest peak, Mt. Nebo, is found at the southern extremity. The streams which are used to fertilize the Great Salt Lake and Utah valleys have their sources in these lofty mountains.

PRINCIPAL SUMMITS OF THE DESERT RANGE SYSTEM.

The Park System extends from Southern Wyoming through Central Colorado into New Mexico; bounded on the N. by the Laramie Plains, on the E. by the Great Plains, and on the W. by the plateaus; the southern limits can not yet be defined. There are a great number of ranges in New Mexico, on either side of the Rio Grande del Norte, having a N. and S. trend, the general structure and geological relations of which are unknown. They may constitute a system or sub-system by themselves, or they may be considered as a part of the Park System, probably the latter. The general trend of the Park Ranges is a few degrees W. of N., but there are exceptions. These mountains are drained by the Platte and Arkansas, which flow into the Mississippi; by the Rio Grande del Norte, which flows into the Gulf of Mexico; and by the Colorado river of the West, which flows into the Gulf of California. The axial ridges of the system—i. e. those which separate the Atlantic from the Pacific drainage—constitute a part of the continental divide. The system is composed of ranges and irregular groups which stand as walls about the great parks. In North Park heads the North Platte; in Middle Park heads the Grand, a tributary of the Colorado; in South Park heads the South Platte; and the Rio Grande del Norte drains the San Luis Park. These parks are elevated valleys, nearly or completely surrounded by mountains. Besides the larger parks mentioned, there are many of smaller extent—mountain-valleys of great beauty in midsummer, but mantled with snow during many months of the year. Most of the ranges are known to be of the Uinta type—i. e. broad, plateau-like masses carved from blocks upheaved in part as integers and in part as bodies of many parts—a structure more fully described below. Many of the park-spaces are zones of diverse displacement. These mountains are composed of granites, schists, Paleozoic, Mesozoic, and Tertiary sediments, and the sedimentary groups are separated by many and well-defined unconformities, giving evidence of alternating periods of dry-land condition and oceanic sway; but the last great orographic movement which upheaved the great masses from which the mountains have been carved began in Tertiary time. These ranges are arranged *en echelon*, the eastern mountain-front running N. and S., while the ranges trend somewhat

E. of S. Hence, proceeding southward, one finds the front range dropping down and disappearing, while its place is taken by that behind, which in turn comes to the front. The following are the principal ranges and groups of this system in succession from E. to W.: Rising from the plains in full view of Denver is the Front Range, which on the N. is nearly continuous with the Medicine Bow Range, the latter being the eastern wall of North Park. To the S. it becomes broken and spreads out into a mass of short ranges and hills, through which the South Platte makes its way to the plains. Just N. of Pueblo, on the Arkansas, it gathers itself and rises suddenly into the great mass of Pike's Peak, and then drops down to the level of the plains. Between North and Middle Parks is the Park View Mountain, an eruptive mass which, with its spurs and outliers, separates the two parks. Next in order to the westward is the Park Range, which extends from Buffalo Peaks northward nearly to the junction of the Sweetwater with the North Platte river. This range forms the western wall of South, Middle, and North Parks. The South and Middle Parks are separated by a series of eruptive mountains, among them Silverheels and Mt. Guyot. From the north end of this range, W. of North Park and the north end of Middle Park, long spurs and irregular mountains extend westward to the plateaus. W. of the south end of the Park Range is the valley of the Arkansas, and W. of the valley is the Sawatch Range, with the Mount of the Holy Cross at its northern extremity. This range trends 30° W. of N. Still farther W. is the Elk Mountain Group, which consists of a series of short, parallel ranges closely massed, trending in the same direction as the Sawatch Range.

Returning to the border of the plains, the first range S. of the Arkansas is the Wet Mountain, a short range, fronting the plains for a few miles only. Its trend is the same as the last. To the W., and parallel with this range, is the Sangre de Cristo, called in one portion of its course the Sierra Blanca. This is a long, high range, fronting the plains for hundreds of miles, and breaks up near Santa Fe. To the W. of it lies San Luis Park, and beyond the park is the enormous irregular rugged mass known as the San Juan Mountains, and beyond are the plateaus.

PRINCIPAL MOUNTAINS OF THE PARK RANGE SYSTEM.

viding them into two sub-systems, the Northern and Southern Coast Ranges. To the N., beyond the head-waters of the Sacramento, the Coast Ranges topographically coalesce with the Cascade Mountains, and to the S., beyond the head-waters of the San Joaquin, with the Sierra Nevada; but here the geological separation is plain, as shown by Whitney. The general trend of these ranges is 30° W. of N. The Coast Ranges are composed of more or less closely oppressed folds of strata degraded by rains and rivers—i. e. they have the Appalachian structure, but complicated and more or less masked by extravasated matter. The summits or axial planes are in general tipped westward or toward the Pacific. The Appalachian type is not known to occur elsewhere in the Rocky Mountain region. The upheaval of these mountains began in the late Tertiary times, and may yet be in progress.

The Cascade Mountains stretch from Southern Oregon northward far into British America. On the E. they are bounded by the great valley of the Columbia river, and on the W. by the Pacific Ocean. The Columbia river, where it bursts through this zone of mountains, plunges to the level of the sea in a series of great cascades, and from these the mountains take their name. They consist of an irregular volcanic plateau, upon which stand many volcanic peaks. They can not be separated topographically, nor is there yet sufficient data to separate them geologically from the northern extremity of the Coast Ranges and Sierra Nevada. Little is known of their general topography and geology, except that the group is characterized by many lofty volcanoes now extinct. The trend of this zone of mountains is a little W. of N.

In Northern California and Southern Oregon the Coast and Cascade Ranges are united by a mass of mountains having little apparent system, in which heads the Klamath river, and from which the group receives its name. These form apparently no part either of the Coast or Cascade System, but are too little known to enable one to speak definitely concerning their relationship.

N. of the Front and Park Ranges there is a break in the mountain system in Central Wyoming. The Union Pacific Railway traverses this region, a great stretch of barren, elevated plateaus. On the N. the mountains rise again in a complex system which extends into Canada. These ranges will be called provisionally the Geyser Ranges. The easternmost of them, known as the Bighorn Range, separates the head-waters of Tongue river from those of Bighorn river, both being tributaries of the Yellowstone. W. of this is a broad, high range, known as the Wind River Range, in which heads Wind river, the upper waters of the Big Horn, and Green river, one of the two forks of the Colorado. The northward extension of this range, known as the Absaroka, separates the head-waters of the Yellowstone from its main affluent, Bighorn river. W. of this range follows a succession of short, broken ranges, the Tetons, the Gallatin, Madison, Ruby, and others.

In Northern Montana the Front Range, which faces the plains, bears the continental divide, separating the waters of the Missouri from those of the Columbia. This range terminates in latitude 46°, where the divide swings to the westward, following a succession of low passes until it reaches the Bitter Root Range. So far as the limited geographical knowledge concerning this range informs us, this is a long, continuous range forming most of the western boundary of Montana, and bearing for a long distance the continental divide upon its crest, separating the head-waters of the Missouri from those of the Salmon river, a tributary of the Columbia. W. of this range in Central Idaho is a

section of ranges separating branches of the Salmon river, a region which is probably as little known as any part of the U. S.

An outlying range to the E., known as the Black Hills of Dakota, is of the Uinta structure, as shown by Newton.

In Canada the Rocky Mountain System is much narrower than in the U. S., and the platform upon which the ranges stand is much lower. From the boundary as far N. as Peace river three members are distinguished: a front range, comparatively simple, known to Canadian geographers as the Rocky Mountains proper, and bearing the continental divide; a broken volcanic plateau; and, bordering the Pacific coast, a northward extension of the Cascade Range, also of volcanic origin and capped with enormous extinct volcanoes.

Still farther northward the Rocky Mountains continue their northwesterly trend, greatly diminishing in importance as they near the Arctic Circle, and finally disappearing between the Mackenzie and Yukon rivers. The Cascade Range continues through British Columbia and Southeast Alaska, following the coast closely and rising in the latter territory until in the neighborhood of Mt. St. Elias it attains a great altitude, having many peaks exceeding 14,000 feet in height and culminating in the great mass of Mt. Logan, 19,500 feet above the sea. The valleys and gorges among these mountains are filled with numerous glaciers which extend very nearly to sea-level. Thence westward, following the coast-line, this range diminishes in altitude, and finally drops into the sea, appearing above its surface in the chain of the Aleutian islands.

In the U. S. the Rocky Mountains, with the Great Plains that stretch eastward, constitute the great arid region where irrigation is necessary to agriculture. In Northern California and Western Oregon and Washington the precipitation of moisture from the Pacific currents is very great, and hence this region is not embraced in the arid district. The arid region is about two-fifths of the area embraced in the U. S., excluding Alaska. From surveys and careful comparative estimates it is shown that it will not be possible to redeem 4 per cent. of the entire region by irrigation when every brook, creek, and river is utilized. Less than 10 per cent. of the region is forest-clad. These forests are on the sides of the high mountains, and extend over the more elevated plateaus. This does not include large districts of country covered with a scant growth of dwarf cedars and pines which can be used for fuel, but are of no value in mechanical industries. Some portions of this forest region are capable of being cultivated without irrigation, but only such crops can be raised as will mature in the short summers of a sub-arctic climate. Of the remaining lands, a large portion is covered with grasses and other plants which may be utilized to some extent for pasturage. The land most suitable for cultivation lies along the streams, and is confined principally to the little valleys nestling among the mountains. The mountains, hills, and plains can furnish nutritious but scant pasturage for herds and flocks, but altogether the agricultural resources of the region are limited. Gold, silver, iron, copper, lead, salt, coal, and many other minerals are found in abundance, and the region is chiefly valuable for its mines.

J. W. POWELL.

**Rodman, THOMAS JEFFERSON:** soldier; b. at Salem, Ind., July 30, 1815; graduated at the U. S. Military Academy and commissioned brevet second lieutenant of ordnance July, 1841; promoted through consecutive grades up to lieutenant-colonel Mar., 1865. His whole life was devoted to the interests of his profession. To him is due the honor of inventing the method of hollow casting and, from the results of his experiments upon metal for cannon and cannon powder, the design and construction of the 15 and 20 inch cast-iron cannon, with their projectiles and suitable powder. The principles involved in giving to the gun its correct exterior form, the proper distribution of strains in the metal, and the regulation of the interior pressure by the progressive burning of the powder were developed by him largely through the use of his pressure-gauge. The path he marked out has been followed by other investigators, and has resulted in the development of modern guns. He was the author of a valuable *Report of Experiments on Metals for Cannon and Cannon Powder* (1861). D. at Rock Island, Ill., June 7, 1871. Revised by JAMES MERCUR.

**Rodney, CÆSAR:** signer of the Declaration of Independence; b. at Dover, Del., Oct. 7, 1728; inherited a large landed property; was sheriff of Kent County 1755-58; member of the Legislature many years, and its Speaker 1769-73; delegate to the Stamp Act congress at New York 1765; was chairman of the Delaware popular convention 1774; elected to the Continental Congress Mar., 1775; was soon afterward elected brigadier-general; signed the Declaration of Independence; served under Washington in the New Jersey campaign 1776-77; appointed judge of the Supreme Court, but refused the office; defended Delaware from British invasion; was made major-general of Delaware militia; was president or executive officer of Delaware 1778-82, and was again elected to Congress, but did not take a seat in that body. D. at Dover, June 29, 1784.

**Rodney, CÆSAR AUGUSTUS:** jurist; nephew of Cæsar Rodney; b. at Dover, Del., Jan. 4, 1772; graduated at the University of Pennsylvania; studied law; was a prominent member of Congress 1803-07; Attorney-General of the U. S. 1807-11; commanded an artillery company 1813; went to South America 1817 as member of a commission to report upon the insurrection against Spain; was member of Congress 1821-22, U. S. Senator 1822-23, and in the latter year became first minister to the Argentine provinces. Author, with J. Graham, of *Reports on the Present State of the United Provinces of South America* (London, 1819). D. in Buenos Ayres, June 10, 1824.

**Rodney, GEORGE BRYDGES RODNEY, Lord:** admiral; b. at Walton-upon-Thames, Surrey, England, Feb. 19, 1718; entered the British navy in his twelfth year; was governor of Newfoundland 1748; re-entered the navy 1752, rear-admiral 1759; in 1762 he captured Martinique, St. Lucia, and Grenada; vice-admiral 1762, baronet 1764, master of Greenwich Hospital 1765, commander-in-chief in Jamaica 1771, admiral and commander-in-chief at Barbados in Dec., 1779, when he sailed from England with a fleet of 30 vessels; defeated a Spanish squadron off Cape St. Vincent Jan. 16, 1780, and broke through the French fleet near Martinique Apr. 17, 1780, for which achievement he received the thanks of both houses of Parliament and a pension of £2,000. In the war against Holland (1781) he captured Dutch Guiana; as commander-in-chief of the West India squadron engaged the French fleet under Count de Grasse Apr. 9, and again Apr. 12, 1782, capturing seven ships of the line and two frigates; was thanked and pensioned by Parliament, and created Baron Rodney of Rodney Stoke, Somersetshire, 1782. D. in London, May 23, 1792. See Hannay's *Rodney* (Men of Action Series, 1801).

**Rodos'to** (anc. *Rhodesstus*, Turk. *Tekirdagh*): town of European Turkey; in the vilayet of Adrianople, on the Sea of Marmora; 77 miles from Constantinople (see map of Turkey, ref. 4-D). Rising upon hills and surrounded by thriving gardens and orchards, it presents an enchanting spectacle as seen from the water. It exports grain, cotton, silk cocoons, wool, skins, and wine, and largely supplies the capital with vegetables, fruit, and fish. Pop. estimated at 25,000, of whom 14,000 are Ottomans, 5,500 Armenians, 4,000 Greeks, and 1,000 Jews. E. A. GROSVENOR.

**Rodriguez Lobo, FRANCISCO:** See LOBO, FRANCISCO RODRIGUES.

**Rodriguez, rō-dree'jes:** an island in the Indian Ocean; the easternmost of the Mascarene group and of the African

islands, lat. 19° 41' S., lon. 63° 23' E.; 365 miles E. N. E. of Mauritius, of which it is administratively a dependency. Area, 42.5 sq. miles. It is of volcanic origin, and consists of a mountain ridge running E. and W., with considerable plains N. and S. The highest point (Le Piton) is 1,160 feet high. It is surrounded by a coral reef through which there are only two passages, each leading to one of the two ports. It is relatively arid, with a maritime tropical climate, and is subject to hurricanes during the northwest, or winter, monsoons. It is devoted to agriculture and fishing. The turtle which once formed an important article of export have disappeared. Rodriguez was not permanently inhabited until 1691, when it was occupied by a Protestant refugee. In time it had a considerable population, mostly slaves, but, on their emancipation, they emigrated, leaving in 1843 a population of only 250. In 1893 it was 2,068, mostly blacks or of mixed Negro blood. The island is of strategic importance and belongs to Great Britain. The language is French.

MARK W. HARRINGTON.

**Roe, EDWARD PAYSON:** novelist; b. at Moodna, Orange co., N. Y., Mar. 7, 1838. He studied at Williams College, and one year at Auburn and part of a year in Union Theological Seminary; in 1862 became chaplain of Second New York Volunteers; was subsequently a hospital chaplain at Fortress Monroe; at the close of the civil war became pastor of a Presbyterian church at Highland Falls, N. Y.; in 1874 removed to Cornwall, N. Y., and began the cultivation of small fruits, publishing *Success with Small Fruits* (1880). He was widely known as the author of many successful novels, including *Barriers Burned Away* (1872); *Opening of a Chestnut Burr* (1874); *A Knight of the Nineteenth Century* (1877); and *Miss Lou* (1888). D. at Cornwall, July 20, 1888.

Revised by H. A. BEERS.

**Roe, Sir THOMAS:** diplomat, traveler, and author; b. at Low Leyton, Essex, England, about 1568; educated at Magdalen College, Oxford; was knighted 1604; explored the river Amazon in Brazil 1609; was sent as envoy to the Great Mogul, Jahangir, and penetrated to Delhi 1614-18; was ambassador to Constantinople 1621-28, to Poland and Sweden, charged with negotiating a peace between those kingdoms, 1629; sat in Parliament for Oxford University 1640; was sent to the Diet of Ratisbon 1641. He brought from Constantinople a valuable collection of Oriental MSS., which he presented to the Bodleian Library, and procured the Alexandrian MS. of the Greek Bible, now in the British Museum. D. in England, Nov., 1644.

**Roebliug, rō'bling, JOHN AUGUSTUS:** civil engineer; b. at Mulhausen, Prussia, June 12, 1806; graduated at the Royal Polytechnic School in Berlin, the subject of his thesis being suspension bridges. In 1831 he emigrated to the U. S., locating near Pittsburg, Pa., and began the practice of his profession on the slack-water improvement of the Beaver river, and later made surveys for a railroad route across the Allegheny Mountains from Harrisburg to Pittsburg. Having begun the manufacture of wire rope at Pittsburg, he obtained the contract for replacing the wooden aqueduct of the Pennsylvania Canal across Allegheny river by a suspension aqueduct, which was opened in May, 1845. This aqueduct consisted of seven spans, each 162 feet in length, the wooden trunk which held the water being supported by two continuous wire cables 7 inches in diameter. The construction of the Monongahela suspension bridge next followed, and in 1848-50 four suspension aqueducts were completed on the line of the Delaware and Hudson Canal. In 1851 the great suspension bridge at Niagara river was begun, and in Mar., 1855, the first locomotive crossed. This structure was erected in the face of most critical opposition by British engineers, who then regarded the suspension system as inapplicable to heavy traffic. (See BRIDGES.) The elegant bridge over the Allegheny at Pittsburg and that over the Ohio at Cincinnati were his next works. His last and greatest undertaking was the bridge across the East river, connecting Brooklyn and New York, which at the time of its erection was the longest bridge in the world. (See BROOKLYN.) The reports, plans, and specifications for this work were all completed and operations begun when he was severely injured in the foot; lockjaw succeeded amputation, and he died in Brooklyn, July 22, 1869. His *Long and Short Span Bridges*, in press at the time of his death, treats of the advantages of combined suspension and arched bridges.—His son, WASHINGTON A. ROEBLING, succeeded him as engineer of the East river bridge, and under his direction it was completed in 1883. Revised by MANSFIELD MERRIMAN.

**Rogers, RANDOLPH**: sculptor; b. at Waterloo, N. Y., July 6, 1825; was in early life engaged in mercantile pursuits at Ann Arbor, Mich., and in New York; became a sculptor in Rome; returned to New York after a few years with the statues of *Nydia*, *A Boy and Dog*, and others, which procured him reputation; designed and modeled the bronze doors representing scenes in the life of Columbus, for the eastern entrance to the Capitol extension at Washington (1858); was several years engaged in finishing the designs for the Washington Monument at Richmond, Va., including statues of Mason, Nelson, and the two Marshalls; executed a statue of John Adams, now in Mt. Auburn Cemetery; *The Angel of the Resurrection*, for Col. Colt's monument at Hartford, Conn.; a colossal memorial monument, 50 feet high, for the State of Rhode Island, erected at Providence 1871, and one still larger for Michigan, erected at Detroit 1873, surmounted respectively by statues representing America and Michigan. He designed, among other works, the colossal bronze statue of Lincoln unveiled at Philadelphia 1871, and a *Genius of Connecticut* for the State Capitol at Hartford, Conn. He presented the entire collection of casts taken from his clay models to the University of Michigan. D. in Rome, Italy, Jan. 15, 1892. Revised by RUSSELL STURGIS.

**Rogers, RICHARD**: clergyman; b. in England about 1550; became a Puritan minister 1575. His *Seven Treatises* (London, folio, 1605; also 1610, 1616, 1627, and 1630) constituted a kind of theological manual much used by the Brownists, and highly esteemed by Wilson, Hooker, and the early divines of New England. D. at Weathersfield, Essex, Apr. 21, 1618.

**Rogers, ROBERT**: soldier and author; b. at Dunbarton, N. H., in 1727; commanded during the "old French war" (1755-63) the celebrated corps of frontiersmen known as Rogers' Rangers, distinguishing himself in the campaigns on Lake George, and taking a prominent part in the defense of Detroit against Pontiac; went to England and published *A Concise Account of North America* (London, 1765) and *Journals of Major Robert Rogers* (1765; new ed. Albany, N. Y., 1888); was appointed governor of Mackinaw, Mich., but was soon accused of plotting to deliver that post to the French, and was sent in irons to Montreal and tried by court martial. On a visit to England in 1769 he was presented to the king; after imprisonment for debt went to North Africa, where he fought two battles in Algiers under the dey; was in Philadelphia 1775, and on suspicion of being a spy was imprisoned by order of Congress; was paroled, but again arrested by Washington, Jan., 1776; was sent to New Hampshire, where he took sides for the crown, and raised a company of loyalists known as the Queen's Rangers, of which he became colonel. He went to England about 1777; was proscribed and banished in 1778; returned to England, where he died in 1800. Besides the works already mentioned, Rogers wrote *Ponteach, or the Savages of America*, a tragedy in blank verse (1766), now extremely rare, and left in MS. a *Diary of the Siege of Detroit in the War with Pontiac* (Albany, 1860; new ed. 1883).

**Rogers, ROBERT WILLIAM, M. A., Ph. D., D. D.**: educator; b. in Philadelphia, Feb. 14, 1864; educated at the University of Pennsylvania, Johns Hopkins University, and at the Universities of Leipzig and Berlin; was Professor in Haverford College 1887-90; Professor of English Bible, Dickinson College, Carlisle, Pa., 1890-93; Professor of Hebrew and Old Testament Exegesis in Drew Theological Seminary, Madison, N. J., since 1893. He has published *Two Texts of Esarhaddon* (Cambridge, England, 1889); *Catalogue of Manuscripts (chiefly Oriental) in the Library of Haverford College* (Cambridge, England, 1890); *Unpublished Inscriptions of Esarhaddon* (Cambridge, England, 1891); *The Inscriptions of Sennacherib* (London, 1892). A. OSBORN.

**Rogers, SAMUEL**: poet; b. at Newington Green, London, July 30, 1763; son of a London banker, whose counting-house he entered in boyhood; published some poetical trifles in *The Gentleman's Magazine* about 1780, and issued a small volume of verse 1786, but attracted no attention until the appearance of his best poem, *The Pleasures of Memory*, in 1792. Succeeding to his father's large estate 1793, he soon retired from active business, published another volume of verse 1798, and in 1803 established himself in the house No. 22 St. James's Place, London, which he made for half a century a kind of headquarters of literary society. He was the intimate (and often the useful) friend of nearly all the noted literary men in Great Britain, and his wealth, liberality, and social qualities gave his productions a vogue to which they intrinsically had no claim. He issued edi-

tions of his own works which are much prized for their artistic illustrations. Among them were *The Voyage of Columbus* (1812); *Jacqueline* (1813); *Human Life* (1819); and *Italy* (1822). D. in London, Dec. 18, 1855. See his *Table-talk* (1856), by Rev. A. Dyce, and *Recollections of Rogers* (1859), by William Sharpe. Revised by H. A. BEERS.

**Rogers, WILLIAM BARTON**: geologist and physicist; brother of Henry Darwin Rogers; b. in Philadelphia, Pa., Dec. 7, 1804; gave scientific lectures at the Maryland Institute 1827; succeeded his father, Dr. Patrick K. Rogers, as Professor of Natural Philosophy and Chemistry at William and Mary College, Virginia, 1829; filled a similar position in the University of Virginia 1835-53; organized the Virginia geological survey 1835, and conducted it until its discontinuance in 1842; removed to Boston, Mass., 1853; lectured before the Lowell Institute on the application of science to the arts; aided in founding the Massachusetts Institute of Technology, and was its first president 1862-68; was president of the American Association for the Advancement of Science 1876, and of the National Academy of Science from 1878. Among his physical papers are *Strength of Materials* (Charlottesville, Va., 1838) and *Elements of Mechanical Philosophy* (Boston, 1852). In conjunction with his brother, he published an essay on *The Physical Structure of the Appalachian Chain, as Exemplifying the Laws which have Regulated the Elevation of Great Mountain Chains Generally* (in *Transactions of the Association of American Geologists and Naturalists*, 1842). His geological writings are reprinted in *Geology of the Virginias* (1884). D. in Boston, May 30, 1882. Revised by G. K. GILBERT.

**Rogersville**: village; capital of Hawkins co., Tenn.; on the Tenn. and Ohio Branch of the Southern Railway; 3 miles N. W. of the Holston river, 50 miles E. N. E. of Knoxville (for location, see map of Tennessee, ref. 5-J). It is in an agricultural region, and contains McMinn Academy, Synodical Female College (Presbyterian, chartered in 1848), several quarries of variegated marble, a roller flour-mill, furniture-factory, a national bank with capital of \$75,000, a private bank, and three weekly newspapers. Pop. (1880), 740; (1890) 1,153. EDITOR OF "HERALD."

**Roget, rō-zhā', PETER MARK, M. D., F. R. S.**: physician; b. in London, England, Jan. 18, 1779; graduated in medicine at Edinburgh 1798; became physician to the infirmary at Manchester 1804; settled in London 1808; was an esteemed lecturer in several scientific institutions, and the first Fullerian Professor of Physiology at the Royal Institution; for twenty years secretary of the Royal Society 1827-47; became a member of the senate of London University 1826; was president of the Medical and Chirurgical Society 1829-30, and became examiner in physiology to London University 1839. D. at Malvern, Sept. 17, 1869. He published *Animal and Vegetable Physiology* (Bridgewater Treatises, No. v., 1834); *Physiology and Phrenology* (1838); and *A Thesaurus of English Words and Phrases* (1852; 12th ed. 1881).

**Rogue River Indians**: See ATHAPASCAN INDIANS; also TAKILMAN INDIANS.

**Rohilkhand'**: a division of the Northwestern Provinces, British India; bounded E. by Oude, W. by the Ganges. Area, 10,884 sq. miles. It is traversed by the railway from Saharanpur to Lucknow. It received its name from the Rohillas, an Afghan tribe, which settled here in the middle of the eighteenth century. Pop. (1891) 5,345,740. M. W. H.

**Rohlfs, ANNA KATHARINE (Green)**: novelist; b. in Brooklyn, N. Y., Nov. 11, 1846. She was married in 1884 to Charles Rohlfs, and afterward removed to Buffalo, N. Y. Her first novel, *The Leavenworth Case* (1878), was a very successful "detective" story, somewhat after the school of Gaboriau. This was followed by others of the same sensational character, including *A Strange Disappearance* (1879); *The Sword of Damocles* (1881); *Hand and Ring* (1883); *The Mill Mystery* (1886); besides a volume of verse, *The Defiance of the Bride* (1882), and a drama, *Risifi's Daughter* (1887). H. A. BEERS.

**Rohlfs, GERHARD**: explorer; b. at Vegesack, near Bremen, Apr. 14, 1831; studied medicine at Heidelberg, Würzburg, and Göttingen; served in the foreign legion of the French army in Algeria; went in 1860 to Morocco, where he lived for some time at Fez, and traveled widely in Mohammedan attire. In 1862 he explored the oases of Taflet. He explored (1863) the eastern part of the Greater Atlas and pushed south to Tuat in the desert. In 1865 he started on his famous journey from Tripoli to Lake Tchad, crossed the Sudan

**Rollin**, rō' lān', CHARLES: historian; b. in Paris, France, Jan. 30, 1661; studied theology at the Sorbonne, but did not take orders; was appointed professor in the Collège de France in 1688; became the rector of that university in 1694, and two years later was appointed coadjutor at the Collège de Beauvais. He lost his position in 1712 because he was believed to hold Jansenist opinions, but was reinstated in 1720. D. in Paris, Sept. 14, 1741. His best-known work is *Histoire ancienne* (13 vols., 1730-38), which has often been reprinted both in French and in English. His other works include *Histoire romaine* (9 vols., 1738-48), continued by Crevier, Lebeau, and Ameilhon, and *Traité des études*.

**Rolling-mills:** establishments provided with machinery for rolling metal (generally in a heated state) into sheets, bars, rails, rods, or wire. The most important are for iron and steel, and it is these that are described in this article; but in general the processes are the same for other metals. In such establishments the typical machine, also called rolling-mill, is an apparatus consisting of two or more cylindrical rolls, with smooth, rough, or grooved surfaces, so constructed and operated as to reduce a billet or pile of heated iron from an initial form as received from the heating furnace to an intermediate or a final shape called for by the market or by the operations to which the metal is to be submitted.

This reduction of a mass to forms of smaller cross-section is performed with great ease and rapidity, and at comparatively small cost where the alternative is hammering or the use of the hydraulic press. The introduction of the rolling-mill by Henry Cort in 1783 was the most effective step in the production of cheap wrought iron and malleable steel, with the exception of the Bessemer process, which has signalized the progress of invention in that important field. The first operation preparatory to the manufacture of wrought iron is that of puddling (see IRON), or the removal of the carbon and silicon from the cast iron, and the production of a puddle-ball, or a bloom, which is then sometimes given a preliminary shaping under the hammer, but is more often taken directly to the rolls. In steel-making, preliminarily to the use of the rolling-mill, the oxidizable constituents of the cast iron are removed by burning out, in the Bessemer converter or in the Siemens-Martin furnace (open-hearth furnace), and the resulting ingot or bloom is treated as is wrought iron.

The first milling operation is that of roughing down, in the roughing-mill (a pair of rolls with roughened surfaces); the second reduces the slabs thus formed to muck-bars, between smooth-surfaced rolls, and these bars are then rolled into the forms required for the market by a third set of rolls. The speed of rotation of the rolls is the greater as the size of bar, rod, or wire is less, or as the sheet is thinner. In making heavy armor-plate rolls 3 feet or more in diameter, turning at the rate of fifty revolutions per minute, are used; thin plates and small rods are often rolled at speeds several times as great, in mills having rolls 8 or 10 inches in diameter. In merchant mills a number of stands of rolls are arranged in such manner as to permit the convenient passing of the metal from the larger to the smaller, the ingot being gradually reduced to the finished rod, sheet, or wire. Tires of iron are rolled from a ring, which is made by first forging a disk of proper dimensions and punching out its center by a heavy press or hammer, and then rolling the rim thus left in a mill made especially for the purpose. If made of steel, the ingot is cast in the desired form for introduction into the mill.

Mills for cold-rolling are given exceptional strength, and reduce rods and bars very slightly, in the cold state, thus greatly increasing their strength and still more their elasticity. The effect of this process was found by Fairbairn, Whipple, and Thurston, who made a long and complete study of the subject, to raise the tenacity of the metal 50 to 100 percent., to elevate the elastic limit in still higher proportion, and greatly to reduce the ductility and malleability of the iron and steel. (*Engineering*, 1878, p. 347.) A slitting-mill consists of a set of rolls with deep collars and grooves alternating, the upper collars fitting the grooves in the lower roll. Between these rolls sheets of thin metal are passed, and by them divided, by slitting, into a number of rods of rectangular section, the collars and grooves acting as shears.

Nearly all the members of machines and structures for

which iron and steel are suitable—ships, roofs, boilers, bridges, railways and their rolling stock, and those adapted to the purposes of general engineering—are so designed that they can be rolled or compounded of rolled forms, for this method of manufacture is essential to their uniformity and cheapness, and this condition does not seriously embarrass designers, because the great majority of desirable forms can be rolled. If the direct products of the rolling-mill, the leading types of which are shown in Fig. 1, are of unsuitable

FIG. 1.

figure or size, endless modifications may be produced by compounding them. It is only necessary in any rolled bar that the cross-section shall be uniform throughout its length, and that none of the grooves required in the rolling shall be wider at the bottom than at the top. The chair-bar Y and the form X (Fig. 1) could not be rolled directly; the flanges must be folded down by a subsequent operation.

The leading features of improvement have been (1) increased capacity, due to larger size, better proportions, stronger materials, and notably to better workmanship. (2) The arrangement of the rolls so as to work both ways. In a simple two-high mill (Fig. 2), running constantly in one direction, the bar, after passing between the rolls, must be drawn back by hand over the top roll, and entered again for another compression; thus half the time and a considerable amount of heat are wasted, and unproductive labor is performed. The first remedy was to reverse the motion of the rolls after the bar had passed through, so that they would draw the bar back again, and in so doing compress it.

The reversing is usually effected by gearing and clutches, and sometimes by reversing suddenly a double engine running without a fly-wheel. In any case the reversing machinery is costly to construct, wastes power, and requires many repairs. In the three-high mill (Fig. 3) the bar is entered at the front of the train, between the middle and bottom rolls, and at the rear of the train between the middle and top rolls. The engine runs constantly in one direction, thus avoiding the shock and delay of reversing; and the additional labor, as compared with the reversing mill, is the lifting of the bar on the back of the train through the height of the middle roll. In light work, such as rails, which are in any case passed to and fro by the workmen on hooks or swinging levers, this additional labor is very small, while in heavy work is raised by tables moved by steam-power.

FIG. 3.—Three-high mill.

The other notable means of performing work on the bar at both passes is Brown's double mill (Fig. 4), introduced in England. It consists of two complete and distinct sets of two-high rolls in double housings, the two sets moving in opposite directions. The bar being entered at H, passes between the rolls A A without touching them, deep grooves being cut in the rolls for the purpose. The bar is caught and reduced by the rolls B B. Before the return pass the bar is moved laterally, and then it is entered in another groove and passes between the rolls

FIG. 4.—Brown's patent mill.

must be kept at work in order to be profitable; and this can be done only in extensive works.

Later improvements have included the extensive employment of automatic devices in all departments and of hydraulic transmission of power, and the use of often enormous hydraulic presses in place of the steam-hammer for reducing ingots and shaping heavy plates, as well as in forging large masses of all descriptions.

**Rollo:** the celebrated conqueror of Normandy. According to the saga of Harald Haarfager he was a son of Ragnvald, jarl of More, and was called Ganger Rolf—that is, Walking Rolf—because he was so large and heavy that no horse could carry him. Harald Fairhair drove him into exile, and this led to his crossing the seas and founding Normandy. According to Dudo, of St. Quentin, who wrote the history of Normandy in the eleventh century, Rollo was the son of a Danish chief, and on account of trouble with the Danish king fled from his native country, fought for many years in France, and finally got possession of Normandy. The Icelandic version making him a Norwegian is that most generally accepted. In 912 Rollo made peace with Charles the Simple in St. Clair. He received for himself and his followers the country along the banks of the Seine river, between the little rivers Epte and Eure. He and his men accepted the Christian religion, and Rollo was baptized at Rouen and took the name and title Duke Robert. He is thought to have been over eighty years of age at the time of his death in 930. William the Conqueror was his great-grandson. See NORMANS. RASMUS B. ANDERSON.

**Rolls, Master of the:** See MASTER.

**Romagnosi, rō-mān-yō-sō,** GIAN DOMENICO: jurist and philosopher; b. at Salso Maggiore, near Piacenza, Italy, Dec. 13, 1761; in 1786 took his legal degree at Pavia; at thirty years of age published his *La Genesi del Diritto Penale*, which was highly esteemed both in Germany and in Italy. In 1791 he occupied important civil offices in Trent, where he continued to practice as an advocate; in 1803 was appointed Professor of Law at Parma, a position which he retained till 1806, when he was called to Milan to assist in digesting a code of penal procedure, which was afterward adopted. Later a chair was created expressly for him in Milan. Upon the fall of the Bonapartist kingdom of Italy he had to endure poverty and imprisonment. Being set at liberty, he continued his labors under great privations, supporting himself by private lessons. D. in Corfu, June 8, 1835. An edition of his works in 19 vols. was published in Florence (1832-35) and in Milan (15 vols., 1836-45). The most noted of his philosophical writings are *Che cosa è la mente sana?*, *La suprema economia dell' umano sapere*, and *Vedute fondamentali sull' arte logica*.

**Romale:** the name applied to the vernacular language of the modern Greeks. See GREEK LANGUAGE.

**Romaine, WILLIAM:** clergyman; b. at Hartlepool, Durham, England, Sept. 25, 1714; studied in Oxford; was ordained a clergyman of the Church of England in 1736, and was appointed Professor of Astronomy in Gresham College, and rector of St. Ann's, Blackfriars, London, where he died July 26, 1795. His sermon on *The Lord our Righteousness*, published early in his career, was so strongly Calvinistic that immediately after its delivery he was practically excluded from the pulpit in Oxford, but in London his preaching was much appreciated. He became an acknowledged leader in the evangelical party in the English Church, and his writings have a reputation among the adherents of this school of theological thought.

**Roman Archæology:** the history of ancient Rome, as illustrated by the remains of its architecture and works of art.

#### DEVELOPMENT OF ART IN ROME.

*The Period of Hellenic and Etruscan Influence.*—Before the establishment of Greek colonies in Southern Italy the site of Rome was occupied by Latins of a low civilization. Roman culture first received a higher impulse when the colonies from Magna Græcia began to extend their civilizing influence toward Latium and Etruria. This was felt by Rome, partly in a direct and partly in an indirect way, through the coast towns of Southern Etruria, where in early times a rich industrial art, inspired by Greek models, had been developed. The Etruscan temple, the *templum Tuscanicum*, followed, as far as our knowledge extends, the Grecian Doric type. The ground plan, however, approached

more to a square, the pediments were higher, the intercolumniations wider, and the building rested upon a high, or long terrace, up to the front of which led an open flight of steps. The oldest temple in Rome, the temple of Jupiter upon the Capitol, built by Tarquinius Priscus, was in the Tuscan style. Also, the clay image of the god placed in the temple, and the *quadriga* of the same material over the pediment, were works by an Etruscan artist. The statue bore the thunderbolt in its right hand, and in its left probably a scepter. The flesh was painted red, and the color was renewed from time to time. The costume of the figure consisted of a removable wreath, probably of gold, and of the *toga palmata*, a garment decorated with Asiatic designs, in which the statue was draped on festal occasions. On the other hand, the wooden image of Diana placed in the temple dedicated to this goddess by Servius Tullius, on the Aventine Hill, appears to have been a Greek work, or at least a copy of one, for it exactly resembled an idol that the Phœnicians had brought with them to Massilia (the modern Marseilles).

Only a few examples of building in stone remain to us from this ancient period. First among these is the Servian city wall, built of colossal blocks of tufa, without cement; then the reservoir (*Tullianum*), at the foot of the Capitol, the covering of which is formed with layers of stone placed over each other, gradually projecting inward as they rise, and finally the vaulted Cloaca Maxima, built by Tarquinius Priscus in order to collect the subterranean springs that percolated through the Roman soil, as well as to drain and dry the morasses of the Velabrum and Forum. The original form of this gigantic work has been greatly modified by later restorations. Other sewers have been discovered which almost surpassed the Cloaca Maxima in size and length of channel and drained almost as vast an area.

Of the first centuries of the republic evidences remain, showing an increase of the direct Greek influence. When it was decided to decorate the temple of Ceres (dedicated 485 B. C.) near the Circus Maximus, two Greeks, Damophilus and Gorgasus, distinguished both as modelers in clay (*plaste*) and as painters, were called to Rome. The types of the Roman copper coinage (which begins under the Decemvirs, 451-449 B. C.) are formed after Greek patterns. The statue erected upon the Comitium to the interpreter of the Decemvirs, the Ephesian Hermodorus, appears also to have been the work of a Greek hand. Still we must not be blind to the fact that the earliest producers of works in bronze were called by the Romans *Volkani* (hence *Vulcanus*), from *Vulci* their place of origin and center of activity.

Especially indicative of the physiognomy of Rome, as it appeared in the fifth, fourth, and in some quarters of the city also during the two following centuries, is the known fact of the employment of Damophilus and Gorgasus as architects. The manner of ornamentation employed by these artists was that of a polychrome, terra-cotta style, early abandoned in Greece, but long in vogue in Latium and Etruria. The walls, whether of brick or of timber, were incrustated with plates of terra-cotta, upon which were painted ornamental, and sometimes also figurative, representations. Polychrome figures in terra-cotta adorned the pediments of the temples. Fragments of stucco decorations made in this manner have been found as well in the Etruscan cities as in Rome upon the Esquiline. They show the vast extension, and, since they represent a succession of different stages of style following each other, the long duration as well, of this method of ornamentation.

A contrast to this gay variety was offered by the dark-gray blocks of peperino, of which the substructions of the temples and of the public buildings generally were formed, although it is probable that even of these the most prominent architectural members were rendered more conspicuous by the addition of color or of metallic incrustations.

A fact of much significance, in reference to the diffusion of Hellenic views of art among the Romans, occurs at the end of this period. In the year 301 B. C. a Roman patrician, C. Fabius, executed with his own hand paintings in the temple of Salus; and the branch of this distinguished family that descended from him received the surname of "the painters" (*Pictores*). The forms of the designs, however, assumed in many respects a peculiarly Italic character—a different stamp from the true Greek art. This fact is proved by the discovery of a copy from one of the original paintings by Fabius Pictor. This is illustrated by Visconti in vol. xvii. (1889) of the *Bullettino archeologico Comunale*, p. 340. This copy, dating from the seventh century of Rome,

ruins of which bear witness to the simple grandeur of the work.

Meanwhile the terrible conflagration under Nero (A. D. 64) had occurred. Of the fourteen city wards (*regiones*) three were entirely, and seven well-nigh entirely, destroyed. A countless number of Roman monuments venerable for age, as well as many masterpieces of Greek art, were sacrificed. Yet this misfortune was not without its advantage to the city, for the government, in rebuilding the city after the conflagration in Nero's time, took measures to make the streets wider and straighter. In consequence of the destruction of entire quarters of the city, room was obtained for the erection of large public buildings. Nero's Golden House, on the south side of the Esquiline Hill, with its surrounding houses and parks extending into the valley between the Esquiline and Caelian Hills, requires only a passing notice; for immediately after the emperor's death (A. D. 68), the whole establishment, with all its luxurious appointments, fell into decay. On the site of the artificial lake, within the gardens of the Golden House, Vespasian began to build the Colosseum. The palace itself was utilized by Titus, in part, as a foundation for his baths.

Architecture received a new impulse under Trajan, who employed an excellent Greek architect, Apollodorus of Damascus. Under the direction of this artist the Forum of Trajan was erected to the N. of that of Augustus. The constructive activity of the Emperor Hadrian is exemplified in the double temple of Venus and Roma on the Velia, the plan of which the emperor designed with his own hand (A. D. 135). It was composed of two temples, having a single roof covered with tiles of gilded bronze. The cellae of the two temples adjoined each other, and the whole was surrounded by a double portico of granite columns. The Mausoleum of Hadrian (Castle of St. Angelo), begun by that emperor and completed (A. D. 140) by Antoninus Pius, consisted of a square substructure, upon which stood a terrace-like superstructure covered with marble and adorned with statues. From the time of the Antonines, besides the column in honor of M. Aurelius, we have remaining only the temple of the elder Faustina, erected A. D. 141, on the north side of the Forum, and afterward likewise dedicated to the memory of Antoninus Pius. The portico, with its ten columns of costly Eubœan (cipollino) marble, left unfluted, is still standing, besides a portion of the cella, which is, however, well-nigh robbed of its marble facing. The back part of the cella has been turned into the Church of S. Lorenzo in Miranda. After the Antonines many sumptuous buildings were erected in Rome. Caracalla strove to surpass all his predecessors in the colossal baths, capable of holding 1,600 bathers, which he commenced on the southeast side of the Aventine Hill, near the Via Appia, but which were not completed until the time of Alexander Severus. Only the brick-faced masonry walls which formed the main body of the building remain. The city wall of Aurelian was constructed in view of the constantly increasing danger from the encroachments of the barbarians. The baths of Diocletian, on the Viminal, were still more extensive than those of Caracalla. Two large halls, which once formed a portion of the baths of Diocletian, are now included in the churches of S. Bernardo and Sta. Maria degli Angeli. The basilica on the Velia, with its three aisles, was built by Maxentius, and remodeled by his successful rival, Constantine. Three of the arches still stand, though robbed of their original ornamentation. They are of an enormous span, and have served as models to many architects of modern times. Constantine presented the city of Rome with baths which were situated on the Quirinal; but the architectural energy of that emperor was mainly expended upon his new capital in the East.

*Interior Decoration.*—In interior decoration much was done with rare and beautiful colored marbles, and this manner of ornamenting wall-surfaces was maintained to the very end of the imperial epoch. Inlaying of one marble or other fine-veined stone with another was freely used. Glass also, either colored in its body or with the surface moulded in ornamental reliefs, was used for wall-tiles. In the earlier stages of the same period the decoration of interiors was chiefly fresco, and in private houses the Greek manner of the time of Alexander's successors was, for the most part, followed. During this period the spoliation of the Grecian republics, partly by plunder and partly by purchase, brought into the possession of the conquerors a considerable collection of panel-paintings, and the custom was then introduced of using these pictures as the central orna-

ment of the wall. Not every one, however, was able to obtain a sufficient number even to meet the demands of a moderately sized dwelling. It was necessary, then, to call in the aid of the fresco-painter, who supplied the lack of the actual panels by imitations executed on the stucco of the walls. This mode of decoration, originating on the eastern shores of the Mediterranean, was imitated by the Romans even in the third century before Christ, and continued among the less opulent down to the period of the decline of classical culture. In Rome and Pompeii, the pictures which occupy the center of the walls are clearly imitations of panel-paintings, as may be seen from the simulated frames which surround them. Where more extensive compositions were to be represented, the imitation of panel-paintings would have given a heavy, cumbersome effect; to avoid this the artists resorted to the device of representing the walls with imaginary openings, the pictures appearing as if seen through these openings. In this manner, for instance, the pictures of Io and Galatea on the Palatine Hill were treated. More extensive spaces, such as corridors, courts, and garden-porticoes, were sometimes decorated in fresco with imaginary outlooks upon parks, grounds, and seaports. The best discovery in this line is that of the "painted house" in the Trastevere. It came to light in 1890, near the banks of the Tiber, at La Farnesina. Its magnificent set of frescoes, dating from the age of Augustus, is now exhibited in Michelangelo's cloisters at La Certosa.

*Sculpture.*—In the Roman sculpture of this period two tendencies, the idealistic and the realistic, may be distinguished. The first occupies itself specially with mythology, but also sometimes takes to the portrait and to the representation of scenes from daily life. Its work is not original, in the highest sense of the word, but is limited, in a greater or less degree, to models from the preceding Greek development. This already shows itself among the artists employed in the service of Metellus Macedonicus. Several evidences lead to the conclusion that these artists sometimes re-treated archaic Greek types in the spirit of free art. Through a series of works that have been preserved we are made acquainted with a group of Athenian artists who lived in the last century before Christ. The most distinguished among these are Apollonius, son of Nestor, the sculptor of the Hercules torso in the Vatican (probably identical with that Apollonius who, after the burning of the Capitoline Jupiter in the time of Sulla, executed the statue of the god designed for the new building); Cleomenes, son of Apollodorus, the artist of the Medicean Venus; Cleomenes, son of Cleomenes, author of the fine portrait-statue in the Louvre mistakenly called *Germanicus*. This last statue repeats the motive of an archaic type of Hermes. The Medicean Venus belongs to those figures which through a series of intermediate stages are gradually derived from the Cnidian Aphrodite of Praxiteles. Glykon, one of the latest artists of the group referred to, in the execution of his statue of Herakles (Farnesian Hercules, Naples), followed a type probably designed by the second Attic school in the fourth century B. C. The naturalistic treatment and the exaggerated expression of physical strength belong only to the artists of the imperial times. We may with entire certainty formulate our judgment concerning these artists, that for the conception they were substantially dependent upon ancient works, but that in the execution they showed independence, and thus lent a new charm to the motives reproduced.

A peculiar direction was taken by the school of Pasiteles, himself a versatile artist of the last century before Christ. There is extant the statue of an Ephebus, with an inscription (Villa Albani), executed by a scholar of Pasiteles, Stephanus; also a marble group (Villa Ludovisi), generally considered to represent the meeting of Orestes and Electra, and shown by the inscription to be the work of Menelaus, a pupil of Stephanus. Eclecticism, which presupposes, in all cases, a dependence upon earlier works, must be considered the essential characteristic of the school of Pasiteles, while the kind and degree of that dependence may in some instances be disputable. The manner of treatment, however, remains as an unquestioned merit of these artists. The same is claimed for Arcesilaus, who wrought the statue of the goddess for the temple of Venus Genetrix, dedicated by Cæsar in 46 B. C.

In other works of sculpture also, belonging to the epoch under consideration, the authors of which are unknown, recent investigations have shown the same dependence upon ancient models. The well-known group representing Venus and Mars, probably connected with a work placed in the

so much to the execution, of which there was no reason to complain, as to the conception; and this supposition is strikingly confirmed by an investigation of the originals reproduced by the mural painters. The compositions occurring in these frescoes, representing scenes from Grecian mythology and from ancient daily life ideally depicted, are by no means conceptions of the imperial period, but rather creations of true Greek art, reproduced here with more or less freedom. Some of these compositions have been traced back with certainty, or at least probability, to known Greek masters. We can easily understand that the selection of the compositions to be reproduced in fresco should fall especially upon those of the Alexandrian period; for this development lay nearest the Romans in respect to time, and exercised also in other directions a manifold influence upon their civilization. Very few wall-paintings can, with any probability, be traced to originals earlier than the time of Alexander. Among the examples found in Rome we may reckon as properly belonging to these only the Nozze Aldobrandini (Vatican Library), the composition and forms of which do not show the artistic principle which was brought to full development in the time of the Macedonian hero. On the other hand, the art of the Alexandrian and Diadochi age occupied itself less with grand subjects of a monumental character (megalographia) than with those suited for cabinet pictures intended for private enjoyment. As these cabinet pictures were not rich in figures, and were of proportionally small dimensions, and as they did not so much attempt powerfully to strike the spectator by the grandeur of the subject as to impress him agreeably by graceful representations of situations easily understood, they were well adapted for reproduction in Roman mural painting. In Roman dwellings these pictures, being placed in the centers of walls generally very limited as to space, satisfied all the demands which could reasonably be made upon such a style of decoration, and afforded an agreeable resting-point for the eye, without absorbing the attention. The subject of the scenes represented, and the sentiments associated with them, were as perfectly comprehensible to the Roman even if he did not understand the Greek language, as to the Greek of the Diadochi period; for the Latin poetry of the Augustan age had borrowed many of its themes from the Alexandrian poetry which had inspired these very pictorial compositions, and they treated the same subjects as their predecessors had done, and in the same spirit.

In Roman fresco-painting an important place is occupied by the landscape, a province of art which also came into independent development during the age of the successors of Alexander. The most beautiful extant paintings of this kind are the landscapes discovered on the Esquiline, with scenes from the *Odyssey* (Vatican Library). The essential merit of the artist who originated the *Odyssean* pictures lies in the plastic development of the landscape, in the clear arrangement of the planes, the harmony of the proportions, and the nobility of form in the figures introduced.

An exclusively realistic tendency manifests itself only in the mural painting of a very inferior kind. In Pompeii this class of pictures is almost entirely confined to houses of a very poor character. After the year 79 A. D., in which the Campanian towns were buried by the unexpected eruption of Vesuvius, we can no longer follow with any certainty the history of this art; however, the few frescoes of later date which are preserved to us show that then, as before, they repeated the traditional mythological motives transmitted from the earlier antiquity, but that at the same time the execution deteriorated from generation to generation. The paintings of a tomb on the Via Latina, belonging to the Hadrian period, show already a considerable decline, as far as the freshness and energy of the work are concerned, when we compare them with the average of the mythological pictures of Pompeii. The rise of Christianity did not tend to arrest this decline, but rather hastened its downward course. Unlike paganism, which in all times had permitted a high degree of independence in the treatment of the forms of the gods and of all mythological subjects, the Church kept art closely hampered by the bands of an orthodox discipline which could not but be detrimental to it. The programme of the Christian faith was especially announced by means of pictures in mosaic, a species of art which makes any individual rendering of the outlines difficult, but which answered admirably the purpose of the Church, to bring before the eye sacred forms and histories under orthodox types and clothed with great brilliancy.

W. HELBIG.

## RESULTS OF RECENT EXCAVATIONS.

The works for the extension and embellishment of Rome executed since 1870 have been the occasion of a great number of archaeological discoveries, which will be described briefly in order to show what immense progress knowledge of the history and topography of the ancient metropolis of the world has recently made. Properly, this description should classify the new monuments according as they belong to architecture, to painting, to sculpture, to epigraphy, but as most of the discoveries relating to the three latter classes must necessarily be mentioned in connection with the edifice to which they belong, it will be simpler to give a topographic description of the architectural monuments.

**Fortifications.**—Rome has been defended at three different periods by three different walls—that attributed to Romulus, which surrounds the Palatine; that of Servius Tullius, which encircles the Seven Hills; that of Aurelian, which forms the inclosure of the city at present. Four fragments of the wall of the Palatine have been discovered, as well as the sites of the gates Mugonia and Romanula.

A third ascent to the primitive city has lately been traced on the side facing the Circus Maximus. It is cut in steps and gradients, and well deserves its classic name of *Scala Caci*. The prehistoric walls of the Palatine are built with tufa quarried on the spot, the quarries being afterward turned into reservoirs for rain-water in case of siege. As to the walls of Servius Tullius, they can be traced to-day at fifty-six different points. They start from the left bank of the Tiber near the Porta Flumentana, skirt the northern cliffs of the Capitoline (discovered 1715, 1873, 1892), and Quirinal Hills (discovered in the Via di Marforio in 1865, in the Piazza di Magnanapoli 1875, in the Colonna gardens, in the Via delle Quattro Fontane 1873, in the Barberini gardens 1827, etc.). Near the Collina gate (Via 20 Settembre) the system of defense and fortification of the city suddenly changes. From a simple wall, built on a ledge of the craggy slopes, half way between the bottom of the valleys and the plateau above, it becomes an *agger* or bulwark composed of a ditch 100 feet wide, 30 deep, of a wall 40 feet high, and of an embankment inside the wall 100 feet wide, from 30 to 40 feet high. The *agger* runs southward to the Porta Esquilina (transformed in 262 A. D. into a triumphal arch of the Emperor Gallienus). It has been discovered since 1870 in its entire length. From the Porta Esquilina to the banks of the Tiber the Servian walls follow the slopes of the Esquiline (discovered in the Via Buonarroti 1887), of the Caelian (discovered in the Via della Navicella 1890, in the villa Mattei 1582), and of the Aventine (discovered at Santa Balbina 1884, at San Saba 1858, in the Villa Torlonia 1854 and 1867, at Santa Sabina 1857), and fall into the river near the modern Arco della Salara. The river front inside the city was likewise fortified with a powerful embankment, the remains of which were destroyed in the nineteenth century in widening the bed of the river itself. The Transtiberine region was not protected by walls, but by a detached fort on the top of the Janiculum (the present villa Savorelli-Heyland).

Of the nineteen gates of Servius, seven have been found, and three are left standing. The Ratumena was found in 1865 in the Via di Marforio; the Fontinalis in Nov., 1875, under the Palazzo Antonelli; the Sanguinalis in 1865 under the Piazza del Quirinale; the Salutaris in Sept., 1892, under the Palazzo Crawshey, Via delle Quattro Fontane; the Collina in 1872 under the Treasury building, Via 20 Settembre; the Viminalis in 1877 near the railway station; the Capena in 1865 near the Church of St. Gregory on the Caelian.

In Dec., 1875, were discovered some vestiges of the citadel, or *arr*, which occupied the northeast summit of the Capitoline, and which seems to have been defended by a double inclosure, the one contemporary with the wall of Romulus, the other with that of Servius.

**Temples.**—The number of temples, either standing or uncovered, which in 1870 was twenty-one, was thirty in 1894. Among those recently unearthed are the temple of Cybele, discovered in 1870 on the Palatine, with the statue of the goddess; the temple of the Dea Dia (Ceres), discovered in 1868 outside the Porta Portese, at the station of the Magliana, with 1,750 lines of the *Acta Fratrum Arvalium* engraved on marble; the temple of the Fortuna Primigenia, discovered in 1873 between the baths of Diocletian and the Pretorian Camp, with many inscriptions and a statue representing the Roman lady Claudia Justa, with the attributes of

plates of bronze ornamented with historical reliefs. Among the ruins of the temples of Isis and Serapis, which stood near the Church Della Minerva, had already been found the obelisks erected afterward in the open squares of the Pantheon, of the Minerva, and in the grounds of the Villa Mattei. Recent excavations in the same place have given a fourth obelisk, entirely covered with hieroglyphics, with the cartouches of Ramses the Great.

**Military Establishments (Castra).**—The military barracks were sumptuous edifices, built, or rather rebuilt, by Septimius Severus, except that of the pretorians, which dates from the reign of Tiberius, and which was restored under the Gordians. Of this latter it was already known that three sides were incorporated into the city walls by Aurelian. The fourth—that is, the west side—has been discovered in consequence of the works in the new quarter of the Viminal (*Castra Pretoria*). It contains seventy-eight small chambers, each capable of lodging six or eight soldiers. A little beyond was found a small apartment, reserved perhaps for the superior officers, the pavement of which was in mosaic, representing scenes of combat, the names of the warriors or the gladiators being marked by the side of each figure. The site of the *Castra Equitum Singularium*—that is, of the barracks of the imperial horse-guards—has been made known by the discovery of thirty-two magnificent monuments, dedicated to their gods by the men who had honorably finished their service (*missi honesta missione*). Hundreds of names are engraved upon them, with indications of paternity, place of birth, dates and duration of service, etc. The men are grouped by squadrons, which are indicated by the name of their commanders, such as the squadron of Marcellus, the squadron of Tranquillinus, etc. These monuments were found in the Lateran district crossed by the Via Tasso. The seven battalions of the vigiles, or policemen, were distributed through the city in such a way that each one occupied the boundary-line between two *regiones*. Recent discoveries established the fact that the barrack of the first cohort (or battalion) was situated below the Palace Saverelli, on the boundary between the VII. (Via Lata) and IX. (Circus Flaminius) *regiones*. That of the second has been found on the Esquiline, very near the Arch of Gallienus; that of the third at the southeast angle of the baths of Diocletian; that of the fifth in the Villa Mattei, by the Church of the Navicella; that of fourth near the Church of San Saba (Aventine). The sites of the sixth and seventh are unknown. Besides the main barracks there were fourteen outposts called *excubitoria*. One of these, belonging to the men of the seventh cohort, has been discovered in the Piazza di Monte de' Fiori, near the Church of San Crisogono. Its preservation is surprising.

**Palaces and Houses.**—The palace of the Cæsars on the Palatine has no unity of plan or of decoration, but is composed of a suite of palaces, differing one from another, built at different epochs, and separated sometimes by streets and squares accessible to the public. The most ancient portion is the house of Augustus, situated on the side of the Circus Maximus. Then follow the house of Tiberius, at the northwest angle of the hill, on the Velabrum; the house of Caligula, at the northeast angle upon the Forum; the house of Nero, at the southeast corner, toward the Colosseum; the house of Vespasian, which occupies the very center of the hill; and, finally, the house of Septimius Severus, at the southwest angle, toward the Porta Capena. Although the condition of these remains is in general very ruinous, yet many apartments preserve sufficient traces to render possible a decision as to their decoration and primitive destination; and the whole plan of the entire group has been reconstructed with as much precision as can be obtained in a house of Pompeii. Among the palaces and private houses of which the position or new details have been discovered should be mentioned the palace of the Laterans, considerable portions of which have been explored, especially in the garden of the hospital of St. John, where fragments of an imperial statue in porphyry and several mosaic pavements have been found; the house of Germanicus, on the Palatine, in perfect preservation, the pictures which decorate the walls being considered as the best among those thus far found at Rome; the house of Asinius Pollio, discovered in the Vigna Guidi, at the southeast angle of the baths of Caracalla; the house of Q. Fabius Cilo, the site of which is occupied by the church and convent of Santa Balbina, and where have been found two superb busts of Caius and Lucius, nephews of Augustus; the house of the Cornelii, discovered in 1873 under the new ministry of finance. In

the house of Avidius Quietus, governor of Galatia under Domitian, discovered Mar., 1876, near Sant' Antonio all' Esquilino, bronze tablets have been found on which are engraved the decrees in honor of Quietus awarded by the cities of the province which he had administered. On one of the walls of the vestibule of the house of Memmius Vitrasius Orfitus, a consul of the fourth century, inscriptions were found dedicated to their master by the officers of the household. Similar inscriptions preserved on the spot have determined the position of the palace of Neratius Cerialis, prefect of the city in the fourth century, on the piazza of Santa Maria Maggiore; of Numicius Pica Casianus, quaestor under Trajan, on the Via Strozzi; of the senator Q. Octavius Felix, near the Church of Santa Bibiana; of Nummius Albinus and of Martial, the poet, under the new War offices, Via 20 Settembre; of Vettius Agorius Prætextatus, in the Via Merulana, etc. The number of private mansions the ownership of which has been established by late excavations may be estimated as 175.

**Villas and Gardens.**—The gardens of Mæcenas, on the Esquiline, have been in a great measure excavated, from the Church of Sant' Eusebio as far as the Via Merulana. The most interesting monument as yet found is a magnificent conservatory in the form of a small oblong theater, the walls of which are decorated with beautiful landscapes. In the neighborhood of this conservatory have been found six Caryatides of Pentelic marble, as well as three *Hermes* of fauns, which were generally placed at the intersections of garden avenues; two fountains, one of which is in the form of a rhyton, or drinking-horn, marvelously sculptured by Pontius of Athens; three busts of philosophers; and several other fragments of sculpture worthy of the age of Augustus and of the artistic taste of Mæcenas. Still more important are the discoveries made on the site of the Horti Lamiani, which adjoined those of Mæcenas, occupying the whole of the rectangle comprised between Via Labicana, Via Merulana, Santa Croce, and San Matteo. In the very center of these gardens the remains of a palace have been found, the east and west sides of which were adorned by porticoes with columns of *giallo antico*. On the two other sides—that is, on the N. and S. of the rectangle—were found bath-rooms of extraordinary splendor. The floors were paved with slabs of precious marble, such as *occhio di pavone*, fleece-alabaster (*a pecorelle*), jasper, agate, etc. Some of the walls were covered with slate ornamented with arabesques in gold; others were incrustated with *opus sectile marmoreum*, or what is called "Florentine mosaic." It was in one of these rooms that on Dec. 24, 1874, there was discovered the group of sculptures which forms the principal ornament of the new museum of the Capitol. This group includes a statue of Venus, a Greek work anterior to the type of that goddess, created by Praxiteles; statues of the muses Terpsichore and Polymnia; a bust of Commodus, represented as the Roman Hercules, perhaps the most perfect work of the kind which antiquity has bequeathed; and a head of the young Commodus. In the same room was found an inscription relating to the improvement of the gardens and the reconstruction of the palace by the Emperor Alexander Severus—that is, by the same who restored the gardens of Sallust, as is proved by another inscription found Apr. 2, 1876, in the villa Spithöver on the Quirinal.

Recent researches also show that almost the whole surface of the Esquiline was occupied by gardens, which, laid out at first for private use, had fallen by degrees into the hands of the emperors, who opened them to the public; so that Rome became perhaps as rich in parks and delightful promenades as is London or Paris. Among the gardens recently discovered may be mentioned those of Vettius Agorius Prætextatus, the site of which is very near the Porta San Lorenzo. Nearly all the foundations of the buildings belonging to these gardens are composed of fragments of statues. A single one of these walls, scarcely 100 feet in length, has yielded 2,500 pieces of sculpture, which, united with infinite patience, have already furnished the museum of the Capitol with seventeen statues and two sculptured vases. It is enough to say that the single statue of a Hercules carrying off the mares of Diomed has been recomposed out of nearly 250 fragments. Foundation-walls built with fragments of statuary are the work of the semi-barbaric Romans of the sixth to the ninth century of our era. They are discovered by hundreds. One, found in 1890 on the banks of the Tiber by San Giovanni de' Fiorentini, contained the now famous account of the Ludi Sæculares celebrated by Augustus in 17 B. C. and by Septimius Severus in A. D. 204.

explicit form to beliefs that are implicitly contained either in Scripture or in tradition. The sources of tradition are in general whatever makes known to us the belief held by the Church at any time on any subject. The documentary sources are the writings of the early apologists, the acts and epistles of the apostolic churches, the works of the Fathers, doctors, and theologians. Moreover, the articles of faith have at various times been summarized in creeds or symbols. Such are the Apostles' Creed; the Nicene, promulgated by the Council of Nice (325); the Athanasian, by St. Athanasius, Bishop of Alexandria (d. 373); and that published by the Council of Constantinople (381).

2. *The Means of Sanctification.*—These consist in the application to each soul of Christ's merits. The sacraments, the ordinary channels of grace, are seven in number: Baptism, confirmation, Holy Eucharist, penance, extreme unction, orders, and matrimony. These are administered with ceremonies peculiar to each prescribed by the ritual of the Church. The Eucharist is not only a sacrament, but also a sacrifice, and as such is offered in the Mass. This is the principal act of worship in the Church and the center of her liturgy. The Office, or public prayer of the Church, is a collection of psalms, extracts from both Testaments, commentaries of the Fathers, and short lives of the saints. It is divided to suit the different hours of the day, and is either chanted in common, as is the case in monastic orders and canonries, or is recited in private, its recitation being obligatory on all who have received the subdiaconate. Both in the Mass and Office there are certain portions which vary according to the liturgical season and the festival which is observed on a given day. Ecclesiastical feasts are days set apart for honoring in a special way some event in the life of Christ, of the Blessed Virgin Mary, or of the other saints. The greater of these feasts are preceded by seasons of a penitential character—such as Advent before Christmas, Lent before Easter, and the vigil of many other festivals. The chief practices enjoined for this preparation are fasting, abstinence, and prayer. Beside the administration of the sacraments, the Church attaches a sacred and symbolical character to various objects, the use of which is destined to inspire reverence and devotion. Hence the blessing of ashes, water, palms, candles, etc., in virtue of which these sacramentals profit those who employ them according to the intention of the Church and with proper dispositions. The language of the Liturgy in the Western Church is Latin, while in the churches of the East the vernacular, mostly in its archaic form, is employed. There exist also differences in the form of the Liturgy itself, and consequently a variety of rites, such as the Coptic, the Armenian, and the Greek. Along with these general means of sanctification for all the faithful, the Church has encouraged the founding of *religious orders*, i. e. of associations whose members are bound by special vows, live under particular rules, and labor for some peculiar purpose, such as caring for the poor and sick, spreading the Gospel, and carrying on the work of education.

3. *The Government of the Church.*—To fulfill her mission of teaching and sanctifying men the Church must enact laws to be obeyed both by clergy and laity. While her doctrines are unchangeable, her discipline varies according to circumstances of time and place. Ecclesiastical legislation is incorporated in the canon law. It is either general—decrees of the pope and of general councils, or particular—statutes of national, provincial, and diocesan synods. As regards its subject, it is either public (*jus ecclesiasticum publicum*) or private (*jus ecclesiasticum privatum*). The former is for the government of the clergy; the latter for that of the laity. The penalties inflicted for violation of ecclesiastical law are of two sorts: the *pœna communes*—excommunication and interdict—which may be incurred by clerical and lay offenders, and the *pœna particulares*—suspension and deposition—to which clerics only are liable. The penal law of the early Church was severe; but this rigor has been mitigated in the course of time. (See PENANCE.) Finally, as the members of the Church are at the same time subjects of the civil power, it has often been found necessary for Church and state to define their relations and settle upon a *modus vivendi*. These agreements regarding the external relations of the Church are termed concordats.

STATISTICS.—1. *General:* The number of Roman Catholics in the world is about 230,000,000. There are 64 cardinals and 12 patriarchs. In the Latin rite there are 820 archbishops and bishops, and in the Oriental rites 56; while the titulars, i. e. those who have no diocese, number 322. 2. *In the United States:* The Catholic population is about 10,000,-

000. The Church has 1 cardinal, 1 apostolic delegate, 14 archbishoprics, 72 bishoprics, and 9,700 priests.

See also the articles PAPAL STATES, JESUITS, GALLICAN CHURCH, TRENT, COUNCIL OF, and VATICAN COUNCIL.

STATISTICAL LITERATURE.—For the statistics of the mediæval Church, the works of Carolus a Sancto Paulo, Miræus, Holstein, Clericus, Schelstrate, and Weidenbach may be consulted with profit. In the nineteenth century Stäudlin, Wiggers, Neher, Silbernagl, Carolus a Sancto Aloysio, Wiltsh, Petri, and others have treated the subject with more or less accuracy. The episcopal catalogues of the Roman Catholic Church have been edited or compiled down to modern times by the Benedictine Gaius: *Series Episcoporum Ecclesiæ Catholicæ . . . a Beato Petro Apostolo* (Lisbon, 1873). Diocesan, provincial, or national religious almanacs and directories are published in most places, to which may be added the reports of the various missionary bodies made known from time to time. The actual state of the Roman Catholic hierarchy is made known yearly in *La Gerarchia Cattolica*, a quasi-official Roman publication; *Les Missions Catholiques*, and the *Annales de la propagation de la foi* furnish details of great value. The Propaganda issues an official yearly bulletin entitled *Missiones Catholice*. The best and newest general summary of the public administration of the Roman Catholic Church is by O. Werner, S. J., *Orbis terrarum Catholicus*, etc. (Freiburg, 1890), and for the Catholic missions, the same, *Atlas des Missions Catholiques* (*ibid.*, 1886), and *Katholischer Kirchenatlas* (*ibid.*, 1888). Official reports of all dioceses, vicariates, prefectures, etc., are made to the proper Roman authorities at stated intervals, and are preserved in the special archives of the respective Roman congregations. For the actual working of the latter bodies, cf. Bange (Catholic), *Die Römische Curie* (Münster, 1854), and O. Meyer (Protestant), *Die Propaganda* (Göttingen, 1852), and the sixth volume of Phillips's *Kirchenrecht* (Regensburg, 1864). The latest statistics of the Roman Catholic Church in the U. S. are found in Sadlier's *Catholic Directory* (New York) and Hoffman's *Catholic Directory and Clergy List* (Milwaukee). Special Catholic directories are annually published for Canada, England, Scotland, and Ireland. J. J. KEANE.

**Romance Languages, or Romanic Languages** [*Romanic* is from Lat. *Romanicus*, Roman, deriv. of *Romanus*, Roman, deriv. of *Ro'ma*, Rome]: those modern languages which, as the result of continuous oral transmission, are the current forms of spoken Latin. The languages grouped together under this name are French, Provençal and Catalan (the latter is hardly more than a dialect of Provençal), Spanish, Portuguese, Italian, Roumanian, and the Rhaeto-Romance dialects. The territory is in general that of the Roman empire, excepting those parts which by later popular migrations or conquest were afterward removed from the sway of the Latin language, and those regions which were never completely Romanized.

The Latin spread in the conquered provinces was naturally the vulgar speech of the soldiers and colonists, not the Latin of the classic writers. Though in the beginning differing from the latter only as careless conversational speech always differs from the more elaborate usage of literary works, it was more subject to local variations, and changes were more rapid than in the literary language. The latter was also studied, however, in the provinces, and there were writers of a certain eminence in Spain and Gaul long after those countries had become Roman provinces. Borrowings from the Latin of literature became later very considerable; they are numerous in mediæval times after the modern languages began to be used in literature, and they have continued up to modern times. In general, the old popular words can be distinguished by their strict observance of the laws of phonetic change, while learned or semi-learned words have been less altered. Compare Fr. *peu*, from *paucum*, with *paucité*, *père* with *paternité*, *chose* with *cause* (both from *causa*).

The vulgar Latin of post-classic times was in the beginning very similar over the whole territory. In its vocabulary it differed somewhat from the literary Latin, more or less vulgar words or meanings being used, as for "horse," *caballus*, a nag, for "fire," *focus*, for "to strike," *batuere*, for "to turn," *turnare*, etc., and derivative words, especially diminutives, were used sometimes instead of the simple ones. Some words from foreign languages were added to the vocabulary. The oldest borrowings from Greek show Greek sounds to have been imitated as heard in Italy. Many of the

were at the stage of voiced (except when unvoiced at the end of the word) spirants; compare *chantée* from *cantata(m)*, *nouer* from *nodare*. The doubled consonants of Latin were simplified except in Italian, which language has by assimilation produced a number of new doublings, as in *fatto* from *factum*, *freddo* from *frig(i)dum*. The Roumanian treatment of some consonant groups is remarkable; compare *opt* from *octo*, *demn* from *dignum*. The phenomena of palatalization can not be discussed here.

The most important final consonants in Latin are *m*, *s*, *t*. Of these, final *m* early disappeared entirely except in a few cases where it followed an accented vowel; compare Fr. *rien* from *rem*. Final *s* and *t* were lost in Italian and Roumanian, but elsewhere *s* was retained, and final *t*, which was for the most part lost, was in French, under certain conditions, retained. The retention of old final *s* and *t* in modern French is to a great extent only for the eye.

The Latin inflections of nouns and adjectives have suffered considerable change. The fourth and fifth declensions disappeared, the former being absorbed in the second declension, the latter in the first and third, so that only three of the old classes remain at all. The neuter gender is no longer distinguished in nouns, but neuter uses of adjective words (as in Spanish) and pronouns are not wholly lost. The old neuters became for the most part masculine, but there are many traces of Latin neuter forms. The Latin cases were reduced in number, partly by the results of phonetic change, partly by the substitution of prepositions with the accusative. The Roumanian still has, in the singular of feminine nouns, a case corresponding in use to the Latin genitive and dative, and the same language has a vocative which may be in part descended from the Latin vocative, but it has no distinction in form between nominative and accusative in nouns. In the other languages of the family the dative in nouns was soon lost, as were also the genitive and the ablative, except in a few instances. In Old French and Provençal a declension with two cases, representing the Latin nominative and accusative, existed; thus in Old Fr. nom. sing. *murs* (from *murus*), obj. sing. *mur*, nom. plur. *mur*, obj. pl. *murs*. Feminine nouns, however, from the Latin first declension were generally alike in both cases, as in modern French. Traces of a similar declension exist in Rhaeto-Romance dialects still; but the modern forms of the languages which had this declension have, with some exceptions, lost the old nominatives, and it can be said that, with the exception of Roumanian, nouns in the Romance languages no longer have any cases, the inflection being reduced to a distinction of plural and singular forms, and even this distinction is largely lost in spoken French. The modern forms as a rule represent the Latin accusative, but in Italian and Roumanian the single form of the plural is from the Latin nominative in nouns coming from the Latin first and second declensions: Ital. *rose*, Roum. *roase* from *rosae*, Ital. *anni*, Roum. *ani* from *anni*; but Fr. *roses*, *ans*, Span. *rosas*, *años*, from *rosas*, *annos*. The declension of adjectives is very similar to that of nouns. Some comparative forms of Latin are widely retained; compare Fr. *meilleur*, Ital. *migliore*, Span. *mejor* with Lat. *melioiorem*; but commonly the comparative is expressed by the aid of an adverb meaning "more" (modern forms of *plus* or *magis*), and for a superlative the comparative with the definite article is regularly used, there being no true superlative.

Among pronouns occur some forms which go back to Latin nominatives, accusatives, genitives, and datives, and these four cases are still more or less living, partly through the aid of new formations, as Fr. *en*, Ital. *ne*, from the adverb *inde*. Ital. *loro*, Fr. *leur* are from *illorum*, though they are now used as datives (Ital. *loro* can also be used as an accusative or even as a nominative) or as possessives. Ital. *lui*, *colui*, etc., Fr. *lui*, *celui* go back to vulgar Latin datives (as *illui*; compare Latin *cui*, *huic*). It is true that these forms are no longer confined to use as object cases. Nominative forms from *ego*, *tu*, and vulgar Latin *illi* or *ille* are also preserved; as from *ego*, Ital. *io*, Roum. *eu*, Fr. *je* (Old Fr. also *jo*, *jou*), Prov. *eu*, *seu*, Span. *yo*, Port. *eu*, while the accusative is shown, for example, in Ital. *me*, Fr. *moi*, etc. Among the descendants of Latin pronouns is to be especially noted the definite article which comes from *ille* (in some dialects from *ipse*) in an unstressed form. Fr. *le*, *la*, Ital. *lo*, *la* represent respectively *illum*, *illa(m)*, just as the same forms are also used as unstressed personal pronouns in the accusative, while the stressed form *illa* gave Fr. *elle*, Ital. *ella*. The indefinite article goes back to Lat. *unus*.

In verb inflexion the passive voice is entirely lost, except the past participle, which is used to form the passive (over

most of the territory) and tenses for completed action in the active voice; further are lost the future indicative, the future or emphatic imperative, the perfect infinitive, the gerundive (not the gerund), the future participle, the supines (in Roumanian the form of the past participle is used also with prepositions in a sense like that of the Latin supines), the imperfect subjunctive (retained in Sardinia), and perhaps also the perfect subjunctive (see below). But of the remaining forms not all are found in every one of the Romance languages. The pluperfect indicative was retained in Spanish, Portuguese, Provençal, and the oldest French among the recognized literary languages, and in these its sense has generally been changed to that of a conditional or (as in Old French) to that of a simple preterite. The future perfect remains in Spanish, Portuguese, and the older Roumanian (but the perfect subjunctive may be in part the source of these forms). The present participle (lost in Roumanian) is mostly found only as a verbal adjective, its place being largely taken by the gerund. The old pluperfect subjunctive is now mostly an imperfect subjunctive; in Roumanian it has become a pluperfect indicative. The perfect indicative where retained has become simply a preterite. By the aid of auxiliaries, however, and of new formations all deficiencies are well supplied. New formations are those for the future indicative and the so-called conditional mood. The former is the result of an old combination of the infinitive with the present indicative of *habere*, the latter of a similar combination of the infinitive with the imperfect or perfect indicative of the same auxiliary. "I shall sing" was expressed by "I have to sing," *cantare habeo*, and "I should sing" by "I had to sing," *cantare habebam* or *cantare habui* (the latter is the basis for the usual Italian form). As such phrases coalesced into single words contraction somewhat disguised the original forms, but the terminations still show the connection with the verb "to have." This method of formation is not the only one in use. Roumanian uses an auxiliary corresponding to Latin *volo* to form the future, and in the western part of the Rhaeto-Romance territory is found a formation for the future corresponding to *venio ad cantare*. To the Romance formations are to be added, besides the future and the conditional, many new past participles, needed to form compound tenses for intransitive verbs, and some others of less importance.

The four Latin conjugations are still more or less well preserved in much of the Romance territory, but the second and third are to a great extent confused, and the greatest vitality is shown by the first and fourth conjugations. In personal endings and in tense formation the influence of analogy has been strong, no conjugational type having escaped it. Remarkable are the variations in the form of the stem, due to different positions of the accent; compare Fr. *tient* and *tenir*, Ital. *tiene* and *tenere*, Fr. *meurt* and *mourir*, Ital. *muore* and *morire*. Old Fr. *aime* and *amer* (now *aimer*), etc. In most verbs of the fourth conjugation an inchoative ending, originally *-isc-*, was added to the stem, appearing in only some forms of the present tenses, in Italian and Roumanian, spreading in French somewhat more, and in Spanish and Portuguese appearing in all the forms of the verb, so that the infinitive in these last ends in *-ecer* instead of *-ir*, and these verbs cease to belong to the fourth conjugation. Compare Fr. *finis* (pres. indic.), *finissais*, *finissant*, with the infinitive *finir*, Ital. *finisco* with *finire*. The formation of the preterite indicative and the past participle is somewhat complicated, especially in the so-called irregular verbs. The occasional Latin reduplication, as in *cucurri*, is lost and other formations substituted, especially with *s* and *x* (cf. Ital. *corsi*, Pr. *courus*); but the perfects *dedi* and *steti* (or vulgar *stetui*) extended their endings to other verbs considerably in vulgar Latin. The past participle also shows influences of analogy, notably for the many forms going back to the ending *-utum*, as in Fr. *eu* (formerly *eū*, *oū*), Ital. *avuto*.

The Romance languages are well supplied with derivative endings or suffixes forming nouns, adjectives, and verbs. One of the most interesting suffixes is the descendant of Latin *mens*, *mentis*, mind, now widely used as an adverbial suffix: Fr. *-ment*, Ital., Span., and Port. *-mente*. These suffixes are mostly of Latin origin, but some are from Greek, as Fr. *-esse*, Ital. *-essa*, forming feminines, from Greek *-essa*, Fr. *-oyer*, Ital. *-eggiare*, Span. *-ear*, and, in less popular form, Fr. *-iser*, Ital. *-izzare*, Span. *-izar*, from *-lāre*; others are from the Germanic, as Fr. *-ard*, Ital. *-ardo*; and the origin of yet others is not quite certain, as of the diminutive *-et* in Fr., *-etto* in Ital. Slavic and other languages have supplied some suffixes to Roumanian.

numerous family to which Cervantes paid his respects. It is impossible, however, to follow all the later and divergent paths of the romance, which lead not to distinct persons so much as to special subjects. Such are romances of the innocent wife, like *Griseldis*; romance interwoven with allegory, like the *Roman de la Rose*; romance with satiric leaning, as in *Reynard the Fox*, which lays the beast-epic under contribution; pastoral romances, like Sidney's beautiful *Arcadia*; and long romances of later date, such as those of Mlle. de Scudéry.

The literature of the romances is enormous, but two works contain ample bibliographical as well as direct information: Ward, *Catalogue of Romances in . . . the British Museum* (i., 1883), and Dunlop, *History of Prose Fiction* (revised ed. London, 1888). For English romances, see G. Ellis, *Spectimens of Early English Metrical Romances* (1848), and the various editions in the publications of the Early English Text Society. For the French, see Nyrop, *Den oldfranske Helledigtning*, and G. Paris, *Histoire Poétique de Charlemagne*.

**Roman Law**: primarily, the body of rules which governed the city of Rome and its citizens. As the power of Rome grew, this system of law was extended over a large part of Italy, but it was not generally introduced into other territories nor made applicable to Rome's subjects as distinguished from her citizens. For the conquered provinces and their inhabitants a different body of rules was worked out. This new law was only in small part a further development of the law of the city; in the main it was a distinct and superior system. It was based on the customs of the various Mediterranean peoples, and representatives of nearly all those peoples ultimately played some part in its development. During the imperial period these two systems were gradually fused into one, and in the codification of Justinian they are presented as a single and substantially homogeneous body of law.

Much of the Roman law has only an historical interest. This is the case with the older law of the city as a whole; this is the case also with the public law of the empire. On the other hand, the principles governing private relations, which were worked out in the later republic and the early empire and which were incorporated with little change in the law-books of Justinian, have more than an historical significance—they are to-day a living force. It was in large part on the basis of the Roman law that the mediæval Church worked out for all Christendom its law of family and of testament. Toward the close of the Middle Ages the law-books of Justinian, as modified by the Roman canon law, became the chief basis of adjudication in the secular courts of continental Europe, and in the so-called "modern Roman law" Europe obtained a body of substantially uniform rules for property and obligations. The principles of the Roman law have not exercised a controlling influence upon the English common law; but in all modern states, except those founded by Englishmen, the existing law is based on Roman conceptions of private right, reveals in its form the influence of Roman legal science, and expresses itself in Roman terms. The modern civil codes of Europe and of Central and South America are Roman in much the same sense in which the existing law of the self-governing British colonies and of the U. S. is English; and in this sense the Roman law and the English law are the two great systems that rule the modern civilized world.

1. **THE LAW OF THE CITY (*Jus Civile*)**.—According to one tradition the city was governed during the first three centuries of its existence (i. e. during the royal period and the first half-century of the republic) by unwritten custom.

According to another tradition the earliest laws were royal enactments. A considerable body of ancient rules, described as royal laws (*leges regie*), existed and were collected in the republican period. Many of these have come down to us, and it is evident that they are simply rules of early custom, similar to those which prevailed among other Aryan peoples. Precepts of a religious or moral nature are blended with rules of a legal character. Their formulation suggests a strong sacerdotal influence—an assumption which is corroborated by other Roman traditions.

**The Twelve Tables**.—Early in the republican period the plebeians complained that the ancient customs of the city were misinterpreted by the patrician priests and misapplied by the patrician magistrates. They therefore demanded that the law be reduced to writing and enacted in statutory form. In compliance with this demand the law of the Twelve Tables was drafted by a commission of ten elected for the purpose, and was approved by the popular assembly (451 and 450 B. C.). Much of this early code has come down to us. It is clearly nothing but a compilation of the older customary law. It differs from the so-called royal laws in that it contains fewer religious precepts and gives a clearer formulation of personal and property rights. It was regarded by the Romans as the great charter of their liberties. As late as Cicero's time Roman schoolboys learned its text by heart; and during the greater part of the republican period it was practically impossible to secure the adoption of any law which directly and overtly abrogated or changed the provisions of the Tables.

**The Republican Jurists**.—Under these circumstances the development of the law was accomplished mainly by interpretation. The scanty and rude provisions of the Twelve Tables were supplemented and modified by a free use of analogy and of fiction. For nearly two centuries after the enactment of the Twelve Tables the priests of the pontifical college controlled the forms of pleading and retained a practically exclusive power of interpreting the law; and it was not until the plebeians had forced their way into this last stronghold of the conservative party (300–254 B. C.) that Roman jurisprudence was secularized. Thenceforward the Roman who wished to study the great body of rules that had grown up around the Twelve Tables was no longer forced to seek an election as pontifex; he placed himself under the instruction of some older jurist. The knowledge of the law was not treated as a means of gaining a livelihood; legal advice was given gratuitously. Next to conspicuous service in war the knowledge of the law furnished the ambitious Roman with the best opportunity of recommending himself to the favor and the suffrages of his fellow citizens. The jurists did not plead cases; this was the business of the orators. They did not directly decide cases unless they happened to be elected judges or appointed referees (*judices*); but in a doubtful case the opinion of some eminent jurist was brought to the referee or was solicited by him, and such an opinion was regularly conclusive.

**Character of the *Jus Civile***.—The civil law of the republic presents many interesting analogies to the older common law of England. It was essentially a body of case law, shaped by decisions. It was very strict and very formal, certainty of law being held in higher regard than equity. It was very technical, but nearly all its technical distinctions were based upon sound principles. The great advance which the Roman civil law represents in universal history is found (1) in the unprecedented clearness with which private rights were marked out and the extent to which the individual was permitted to shape his own legal relations; and (2) in the separation of law and religion. This last step was one which no Asiatic or European people had previously taken.

2. **THE LAW OF THE ANCIENT WORLD (*Jus Gentium*)**.—With the extension of Roman rule over the Mediterranean basin, legal problems were presented which could not be solved by the law of the city. The protection of the civil law could be accorded to aliens only through inter-state treaties, and the conquered provincials (as distinguished from the favored allies of Rome) were not merely aliens—they were stateless aliens. The states of which they had been citizens had been destroyed by war. They themselves were simply subjects of Rome. In theory they were the slaves of the Roman people, and their property belonged to the republic. In fact, they were treated as freemen, and it was necessary to administer justice to them.

A more serious difficulty lay in the inadequacy of the city law to meet the needs of the new empire. The Roman civil law had been worked out by and for a people whose chief

*The Edict of Caracalla.*—During the first two centuries of the Christian era Roman citizenship had been conferred upon great numbers of provincials. Early in the third century Caracalla declared all free inhabitants of the empire to be Roman citizens. This edict swept away the last remaining differences between civil and provincial law. Technically speaking, the empire was henceforth governed by the law of the city; but as the civil law had been completely remodeled in accordance with the principles of the *jus gentium*, the substantial triumph rested with the latter system.

*The Later Empire and the Codification of Justinian.*—The list of the great jurists is abruptly closed about the middle of the third century. After Paul but one name of note occurs, that of Modestine. The development of the law was henceforth carried on by imperial decrees or "constitutions." The breach with the old order, however, was less complete than it appears to be. Most of the constitutions issued during the last half of the third century were "rescripts." These were responses rendered in the name of the emperor to petitions requesting imperial decision of concrete cases. Such applications had been made throughout the early empire. In some cases the emperor decided these cases in council; more frequently he assigned their decision to the ordinary judges, with instructions, however, touching the principles which should be applied. In substance, therefore, these rescripts were decisions rather than statutes. The rescripts issued in the reigns of Gordian and of Diocletian are similar in form, and not inferior in the quality of their legal reasoning, to the average responses of Ulpian and Paul. Jurisprudence had not yet sensibly waned, as it did in the fourth and following centuries, but the jurists had disappeared behind the throne, and spoke only with the voice of the emperor.

Technically, however, the rescripts, as well as the general decrees of the later emperors, were imperial "laws" (*leges*), and were distinguished from the older law (*jus*) very much as we distinguish statutes from common law.

The first attempts at codification were confined to the imperial constitutions. A private collection of rescripts was made at the end of the third century (*codex Gregorianus*), and a supplement was issued late in the fourth century (*codex Hermogenianus*). In the year 429 the East Roman emperor Theodosius appointed a committee of codification. It was clearly his intention to have the entire law, both the *jus* and the *leges*, brought into manageable compass; but nothing came of his initiative except an official revision of the imperial constitutions (*codex Theodosianus*). This code was transmitted to the Emperor Valentinian III., and was published in both the Eastern and the Western empire in the years 438 and 439.

The Emperor Justinian (527–565) and his minister Tribonian took up the wider plan of Theodosius. A new collection of imperial constitutions was published in the year 529. A committee was then appointed to digest the juristic literature, omitting all that was antiquated and avoiding contradictions. The result of their labors was the *Digest* or *Pandects*, which consisted of more than 9,000 excerpts from the writings of thirty-nine jurists, arranged under 429 titles and grouped into fifty books. Each excerpt or fragment is preceded by the name of the writer and the title of his work. As a rule, the excerpts were literally reproduced, without condensation or other change. During the progress of this work an official text-book was drafted, intended primarily for use in the imperial law schools. It was based on the *Institutes* of Gaius, and bore the same title. The *Institutes* and the *Digest* of Justinian were published Nov. 21 and Dec. 16, 533. In the meantime the *codex* of 529 had become antiquated. A number of controversies had been discovered in the juristic literature, and no less than fifty new constitutions had been issued for their decision. A *Codex* "of the second reading" (*repetite prelectionis*) was therefore published Dec. 29, 534. It contains more than 4,600 constitutions (more than half of them "rescripts"), arranged in twelve books. The *Institutes*, *Digest*, and *Codex* were declared to be henceforth the sole sources of the law, and to forestall further controversy it was made a penal offense to write commentaries upon these books. During the remaining years of his reign Justinian issued many new constitutions. Of these *Novels* (*novellæ leges*) only private compilations were made.

The value of Justinian's work lies mainly in the fact that the Roman law was not codified in the modern sense of the word; i. e. no attempt was made to set forth the entire law

as a body of positive rules. In the excerpts from the juristic literature which make up the *Digest* and in the rescripts contained in the *Codex* we have a great body of rules stated only by implication, and therefore capable of reformulation. This gives the Roman law that elasticity which is inherent in all case law. This made it possible to apply the underlying principles of the Roman law to the new and different social conditions of the Middle Ages, and this makes the law-books of Justinian of value to-day to the student of legal science.

4. ROMAN LAW IN MEDIEVAL AND MODERN EUROPE.—*In the East.*—The collections made by Justinian continued to be employed in the East Roman or Byzantine empire until the close of the ninth century, when they were displaced by a less bulky compilation, known as the *Basilica* (sc. *nomima*), royal laws. This book remained nominally in force until the fall of Constantinople (1453), but it was superseded in practice by a series of private digests and compendiums, each briefer than its predecessor. One of these, the *Hexabiblos*, compiled in the fourteenth century, was extensively used among the Christian subjects of the Ottoman empire, and was in force in the kingdom of Greece as late as the middle of the nineteenth century. It is said that the Roman law in its later Byzantine form exercised a considerable influence upon the development of the Turkish law.

*In the Teutonic Kingdoms.*—Half a century before Justinian ascended the throne at Constantinople the West Roman empire had fallen. In most of the Teutonic kingdoms established in Western and Southern Europe the conquered provincials were permitted to live by the Roman law (the so-called system of the "personal statute"), and several of the kings had handbooks of Roman law compiled for the use of their Roman subjects. The most important of these was the so-called *Breviary* of Alaric II., King of the Visigoths (A. D. 506). It included a condensation of the *Institutes* of Gaius, a portion of the *Opinions* of Paul, and a considerable number of constitutions from the older codes, particularly the Theodosian.

*Local Law.*—As the Romanic and Teutonic elements in Western and Southern Europe were gradually fused into new nations, the system of the "personal statute" was necessarily abandoned, and the Roman law became the local law of those districts in which the Romanic element was preponderant. In France, for example, the southern provinces, where it was regularly applied, were known as the "lands of written law" (*pays de droit écrit*), in distinction from the "lands of custom" (*pays coutumiers*), where Frankish usages prevailed. Until the latter part of the Middle Ages, however, the economic conditions prevailing throughout Europe were so simple that the Roman law which was required and applied was but a slight part of the jurisprudence which had grown up in the second and third centuries. Until the twelfth century the *Breviary* was almost the only source of Roman law employed in Western Europe.

*The Canon Law.*—Of greater importance was the survival and development of Roman law in the mediæval Church. It was an unquestioned maxim that the Church lived by the Roman law. Its entire sacerdotal personnel stood outside of the tribal and local laws which governed the laity, and in many matters which are to-day regarded as secular (marriage and the family relations, testamentary succession, etc.) it claimed and obtained a practically exclusive jurisdiction over all Christians. From the court of the bishop (see ORDINARY) appeals ran to Rome and by the decisions of the popes a great body of new law was gradually built up—the *jus canonicum*. See CANON LAW and MARRIAGE.

*Study and Reception of the Law-books of Justinian* (1100–1600).—Toward the close of the eleventh century the law-avers of Lombardy began to have recourse to the *Digest* of Justinian for the solution of questions upon which their local law was silent. In the twelfth century flourishing law schools existed at Bologna and other Italian university centers in which the Roman law, both civil and canon, was systematically taught, and to which students from Western and Central Europe (*ultramontani*) thronged by thousands. In the course of the same century Roman law was read at Montpellier, at Paris, and at Oxford. In the following centuries it became a regular branch of instruction in the new universities established in the Netherlands and in Germany. In those countries where Roman law was already in force the law-books of Justinian began to be cited in the courts, and in countries where the Roman law had previously

[illegible]

the international world the recognition of the Russian land as the first and most important step in the process of the internationalization of the Russian industry. Each of these steps, says the report, is really and in part a measure of the progress of the economic development of the Russian Republic. The report recommends as a first step in this recognition the recognition of the Russian Republic as a sovereign state, which is a necessary condition for the recognition of the Russian Republic as a sovereign state.

[illegible]

It is, however, a question whether the French law is in accordance with the complete exemption of France of some of her banks, and that discharged, later, under the name of the "national law" which she is known to have passed a general exemption for most of her banks, and that is a contradiction. The point is raised in the French law, however, has been the same, and the national law for divergent and not the same, and the point is that the law is not in accordance with the national law of the French bank and the law of the French bank is not in accordance with the national law of the French bank.

Scientific Museum and the new Museum which have opened in 1924, are entirely devoted to a better study of the collection of insects, and to the study of the life of insects. In 1924, the first book of a collection of insects was published, a valuable exception to the Museum's publications has taken place, a new book, which will be published in 1925.

THE NEW AND ENLARGED. For this class Richard Kebleton and his companions are leaving their Mountain South, across Colorado, and through the deep valleys and rugged canyons. The *Incisor* of teeth have been transformed into fangs, by Peter and by Marshall, the *Dactyl* of 14 and by Marshall, the *Incisor* of Southern by Male. The last addition to the strange fauna comes in that of Mountain and Kebleton, the last addition of the *Incisor* of Southern comes next of Marshall. History of the fauna has by Kebleton are continuing the last by Kebleton of the 14 Marshall. The last and important of the fauna has by Kebleton to the first 14 of Southern *Incisor*. For the transformed history of fauna has the last book is still that by Kebleton. For the complete, see the words of Schmitt and Kebleton.

MOUNTAIN, SOUTHERN.

**Romanoff:** the name of the family from which the present dynasty of Russia descends its origin. Michael Feodorovich Romanoff, the first sovereign tsar of his preponderance of the royal house of Russia, was the first of the name to ascend the imperial throne, being chosen by the highest nobles and the clergy in 1614. His successors in the name continued till the death of Peter II, in 1727, when the succession reverted to the female line. Another change took place on the death of Elizabeth in 1762, when her nephew, the son of the Duke of Holstein-Gottorp, assumed the throne under the title of Peter III, founding the dynasty of Romanoff-Gesars, to which the present sovereign of Russia belongs. See Russia and the articles on the Russian empire.

Romanian, or Romanian? See Vol. 100, No. 4, p. 143, col. 17.

**Romans, Epistle of St. Paul to the**—One of the great masterpieces of the Christian books, probably written from Corinth. It affords some fine examples of the noble and eloquent penning style and reasoning of the great apostle; that its authenticity has never been seriously called in question. Its contents are largely destroyed, but it contains the hortatory passages and demands for penitence and conduct. Its theological literature is extensive. The Epistle remains a thorough and comprehensive statement of the doctrine of Paul. He wrote the epistle to the Church at Rome, which had been already established, probably by some of the apostles. In order to prepare the way to a visit which he was anxious to make to them (xx. 29). At the time of writing he was under the necessity of going to Jerusalem (xx. 26-27). He therefore closed at the point described in Acts x. 43 that is, about the year 58. For literature see Pauline Epistles, to which add the English translation of the work of Gieseler on the Pauline Epistles (Edinburgh and New York, 1844).      Revised by S. M. Jackson.

**Romanticism** (liter., of *romances*, from *O. Fr.* *romance*, *langue romanche*, *langue of romans*, *romans*); a term applied to a literary school or movement which is opposed to the realistic and ideals of classicism.

*Illustrations.*—The following are some of the definitions given by well-known writers. Heine:—"The romantic school in Germany was simply the transference of the poetry of the Middle Ages. *Maria de Staël*:—"The name romantic was introduced in Germany to designate the poetry which was born of chivalry and tournaments." *Walter Pater*:—"It is the addition of strangeness to beauty; it constitutes the romantic character in art." *Dr. F. H. Hedge*:—"The romantic feeling has its origin in wonder and mystery. It is the sense of something hidden, of imperfect revelation. . . . The peculiarity of the classic style is its calm, self-suppression of the writer. The romantic is self-expressing." *Prof. Reyeren*:—"Romanticism is really on one side retrogressive, as it seeks to bring back the past, and on the other hand progressive as it seeks to break up the traditional ordered things." *George Sutherland*:—"The terms classic and romantic apply to treatment and to subject, and the difference is that the treatment is classic when the idea is represented as directly and with as exact an adaptation of form as possible, while it is romantic when the idea is left to the reader's faculty of divination assisted only by suggestion and symbol." *Sector Hupke*:—"Romantic

ticism, so many times badly defined, is simply liberalism in literature."

**Essential Qualities.**—All these definitions have something in common. There are evidently three essential qualities in romanticism: Subjectivity, love of the picturesque, and a reactionary spirit. By the first is meant that the aspiration and vague longing of the writer will be manifest in his literary production; by the second, that element of strangeness added to beauty, which Pater declares is fundamental; this may appear mildly, as where the writer is fond of ivy-mantled towers and moonlit water, or may turn into a passion for the unnatural and the horrible, as in tales of ghosts and of deeds of blood. By the third is meant that the romantic movement in any country will always be reactionary to what has immediately preceded; it may be gently and unconsciously reactionary, as in England, or proudly and fiercely rebellious, as in France.

**Mediævalism.**—Taking these three elements, subjectivity, picturesqueness, and reaction, it is easy to see why the romantic movement in Great Britain, in Germany, and in France, went for its inspiration back to the Middle Ages. In the Middle Ages lay just the material for which the romantic spirit yearned. Its religious, military, and social life can hardly be better characterized than by the word *picturesque*; and souls weary of form and finish, and of the monotony of rules, naturally sought the opposite of all this in the literature and thought of the Middle Ages. And as the classicists had neglected this period above all others, and treated it with contempt, the reactionists began with an attempt to revivify and brighten this mediæval life.

**English Romanticism.**—The most striking difference between the romantic movement in France and in Great Britain is that in the former the movement was conscious, while in the latter it was only instinctive. French romanticism had a definite programme, backed almost from the start by a critical school, and headed by one supreme creative genius. English romanticism was a totally different thing. Its beginnings are so faint and so far below the surface that many writers seem to believe that English romanticism began with the nineteenth century, and that in the "age of prose and reason" there was no such thing as a romantic movement at all. It is certainly impossible to name any author as the chief pioneer; for even at the height of Augustan taste there were feeble signs of reaction shown by such writers as Parnell, Croxall, Lady Winchelsea, William Hamilton of Bangour, and Allan Ramsay. The reaction in form, which resulted in the overthrow of the heroic couplet, was brought about by Thomson, Blair, Dyer, Young, Akenside, and others, who cultivated blank verse. The sonnet was revived by Thomas Edwards, Thomas Warton, Stillingfleet, and Mason. Perhaps the most marked change, both in thought and style, is indicated by the Spenserian revival—the renewed study of his poetry and the metrical imitations of his stanza. The latter began as early as 1706, with an ode by Prior, and the fad reached its highest popularity in the years 1735–55, when about forty poems by various writers appeared in Spenserian form. The influence of Milton's poems—especially his *Il Penseroso*—was very effective after 1750, giving to literature a dreamy, melancholy cast, which aided in developing the churchyard school. The Warton brothers, happily re-enforced by the lyrical genius of Collins, were the leaders of the Miltonic group, and became prominently identified with the romantic movement. Joseph Warton wrote blank verse and odes, but his most important contribution was his *Essay on Pope* (1756), in which he maintained that Pope, being deficient in the higher qualities of poetry, imagination, and passion, could not be classed in the first rank of British poets. Thomas Warton wrote sonnets and poems on romantic themes, and aided the Spenserian school by his *Observations on the Faery Queen* (1754). Following the influences just mentioned came the rage for mediævalism, shown in the revival of Gothic architecture, begun by the dilettante Horace Walpole. He did pioneer work by building a fantastic structure at Strawberry Hill (1750), and by writing the extravagant Gothic romance, *The Castle of Otranto* (1764). The love and study of chivalry, for which Thomas Warton made a strong plea in his *Observations*, was greatly aided by Hurd's *Letters on Chivalry and Romance* (1762). Meanwhile a taste for old ballads, which was created in 1723 by a very popular collection of old ballads (anonymous) and in 1724 by Ramsay's *Evergreen*, received a tremendous impetus by the publication of Percy's *Reliques* (1765). The love of mediævalism showed itself also in the opening of a new romantic storehouse—the Northern mythology. In

1755 Paul H. Mallet published the first part of his *Histoire de Dannemarck*, which treated of the religion, laws, and customs of the ancient Danes, and which gave a translation of a large portion of the Eddaic mythology. Percy and Gray became enthusiastic students of this, and made Odin nearly as familiar to readers as Jupiter. Old Welsh poetry was also cultivated; and everything old or wild or sentimental leaped into popularity by the publication of Macpherson's Ossianic poetry (1760–63), which ultimately was taken more seriously on the Continent than in Great Britain. It was fortunate for the movement that the greatest poet of the time, Gray, finally threw his whole influence in its favor. Beginning as a classicist and disciple of Dryden, Gray came strongly under the influence of the *Il Penseroso* group, and finally ended in downright romanticism. Gray was also the first man of note in the eighteenth century to appreciate natural scenery, and his *Journal in the Lakes*, written 1769, published 1775, is full of the Wordsworthian spirit. By 1770 the romantic movement was in full swing; Chatterton's poems were an important contribution, and two great sides of the movement—the taste for ballads and for chivalry—culminated in the poetry and prose of Walter Scott. Byron belongs to sentimentalism more strictly than to romanticism, but his influence on the romantic schools in France and Germany was enormous. Coleridge and Keats are identified with romanticism, and Wordsworth's methods and theories would certainly give him a place in the history of the movement. After 1830 romanticism in Great Britain became less pronounced, because everything in a sense was romantic; there was nothing to fight.

**French.**—Speaking generally of the literary history of the two countries, Great Britain has almost consistently stood for romanticism; France for classicism. The romantic movement in Great Britain in the eighteenth century was really the heart of the people asserting itself, timidly and instinctively at first, against the domination of a critical school; while the romantic movement of 1830 in France was a bitter, desperate fight between a band of young reformers and the national literary instinct. The beginnings of French romanticism may be seen in the writings of Chateaubriand and Madame de Staël, but it was with Victor Hugo that the school definitely began (and ended) its work. In the preface to *Cromwell* (1828) he laid down plainly and defiantly the romantic programme, which was fought for by the presentation of his *Hernani* in 1830, and the publication of his great romance *Notre Dame de Paris* (1831). A group of young writers followed enthusiastically in Hugo's wake; they and the movement are well set forth in Gautier's *Histoire du Romantisme*. The school directed its sharpest attacks against the classic French drama, and this reform was the most important literary result they accomplished. The emancipation proclaimed, and at last established, the movement naturally spent its force.

**German.**—The German romantic movement is not so easy to follow. Between the years 1770 and 1832 it flourished, drooped, and flourished again. Herder's enthusiastic interest in the past kindled a flame of mediævalism, which was re-enforced by Ossianic sentimentalism from Great Britain. Ossian's influence on Goethe's *Werther* is well known, and *Götz von Berlichingen* (1773) came from the heart of Goethe's youthful romanticism. Twenty years later, however, the interest in Greek antiquity put mediævalism in the shade, and classicism became supreme. Then in the early years of the nineteenth century the romantic school asserted itself with renewed force, and a younger generation of poets took up eagerly the cultivation of old patriotic German literature. The Schlegel brothers, Tieck and Novalis, were the leaders of the romantic school proper; the younger, or new romantics, were represented by Uhland, Brentano, the Grimm brothers, Arnim, and others.

WM. LYON PHELPS.

**Romany Language:** the language of the GYPSIES (q. v.).  
**Rome** [from Lat. *Rōma* (whence Gr. *Ῥώμη*) > Ital. *Roma* : Fr. *Rome* : Span. *Roma*]; the chief city of ancient Italy, giving its name also to a great republic and empire; the capital of the modern kingdom of Italy.

#### I. ROME FROM 753 B. C. TO 476 A. D.

THE EPOCH OF THE KINGS (*Legendary Dates*, 753–509 B. C.).—According to the legends current during the later republic, the city was founded in 753 B. C. by a settlement from Alba Longa led by ROMULUS (q. v.). The earliest ac-

functions passed to the *comitia centuriata*, reorganized on a democratic basis at some time in the third century, and to the *comitia tributa*, in which the whole people met in their tribal divisions. "As a righteous retribution for their perverse and stubborn resistance," the patricians saw "their former privileges converted into so many disabilities," since they were forced to share these privileges with the plebeians, and were excluded from election to the tribunate and from membership in the special plebeian assembly.

While the popular assemblies thus "acquired the semblance, the senate acquired the substance of power." The assemblies were unwieldy, the power of the magistrates was weakened by division and by the shortness of their terms; the senate alone had a continuous policy, and it drew to itself the control of elections and legislation and the general direction of the policy of the state. On the ruins of the old nobility of birth arose a new patricianism based upon wealth and possession of office.

*The Conquest of Italy (509-275 B. C.).*—The same generation that saw the formal completion of plebeian rights by the Hortensian law witnessed the establishment of Roman supremacy in Italy. The wars that followed the expulsion of Tarquinius Superbus deprived Rome of her hegemony over Latium and reduced her almost to her original limits, so that for a time the very existence of the state was threatened. The chief enemies of Rome in this period were the Volscians, situated to the southeast, the Sabine and Æquian mountaineers to the east and northeast, and the powerful Etruscan confederacy across the Tiber. Against these, in 498, an alliance was formed between Rome and the towns of the Latin confederacy, and in 486 this league was joined by the neighboring Hernicans. The long and doubtful wars which followed, embellished by Roman annalists with poetic details and the half-fabulous stories of Coriolanus and Cincinnatus, brought little advantage to Rome. The state was weakened by civil dissensions, and only after these were temporarily healed by the decemviral legislation and the reforms which immediately followed it, did the Romans begin the steady advance which brought them in 406 before the gates of the important Etruscan city of Veii. The capture of Veii, after a ten years' siege, was an event of great importance in the territorial growth of Rome, since it removed the most serious obstacle to the advance of Roman power. In the year 390 Rome was taken and burned by the Gauls, a Celtic people from the north of Italy. In spite of the immediate loss, the Gallic invasion, seems in the end to have favored the growth of the Roman power, by weakening Rome's great rival, the Etruscans, and putting Rome into the position of a defender of the rest of Italy against the foreigner. A war with the Latins ended in 338 in the dissolution of the Latin league and the incorporation of most of its members into the Roman state. In 306 the Hernican confederacy met a similar fate. The overthrow of the powerful tribe of the Samnites in 290, after a struggle which had lasted with little intermission for more than fifty years, led to the subjection of their Etruscan and Umbrian allies, and the defeat of Pyrrhus at Beneventum in 275 put an end to the independence of the Greek cities in the south, and left Rome mistress of Italy. The Roman territory (*ager Romanus*) received considerable additions, but Roman supremacy was most effectively secured by the founding of colonies, by the building of military roads, and by the grant of municipal rights and the establishment of treaties of alliance with the conquered cities.

*The Establishment of Roman Supremacy in the Mediterranean (264-133 B. C.).*—Rome's attempt to extend her dominion beyond Italy brought her at once into conflict with Carthage, the leading power in the western Mediterranean. The immediate occasion of the first Punic war was the interference of Rome in the affairs of Sicily, which was then in dispute between the Carthaginians and the city of Syracuse. The war lasted from 264 to 241, and resulted in the victory of Rome only after she had created a navy and learned to compete with the Carthaginians on the sea. Shortly after the conclusion of peace, Rome took advantage of the mutiny of the Carthaginian mercenaries to annex the possessions of Carthage in Sardinia and Corsica. While Rome was engaged in subduing the Gallic tribes in the valley of the Po, Hamilcar Barca conquered Spain for Carthage. His son Hannibal began the second Punic war in 218 by leading his army over the Alps into Italy. Important victories on the Trebia, at Lake Trasimenus, and at Cannæ, gave him control of the Po valley and the southern part of the peninsula, but he was unable to attack successfully the city of Rome or to shake

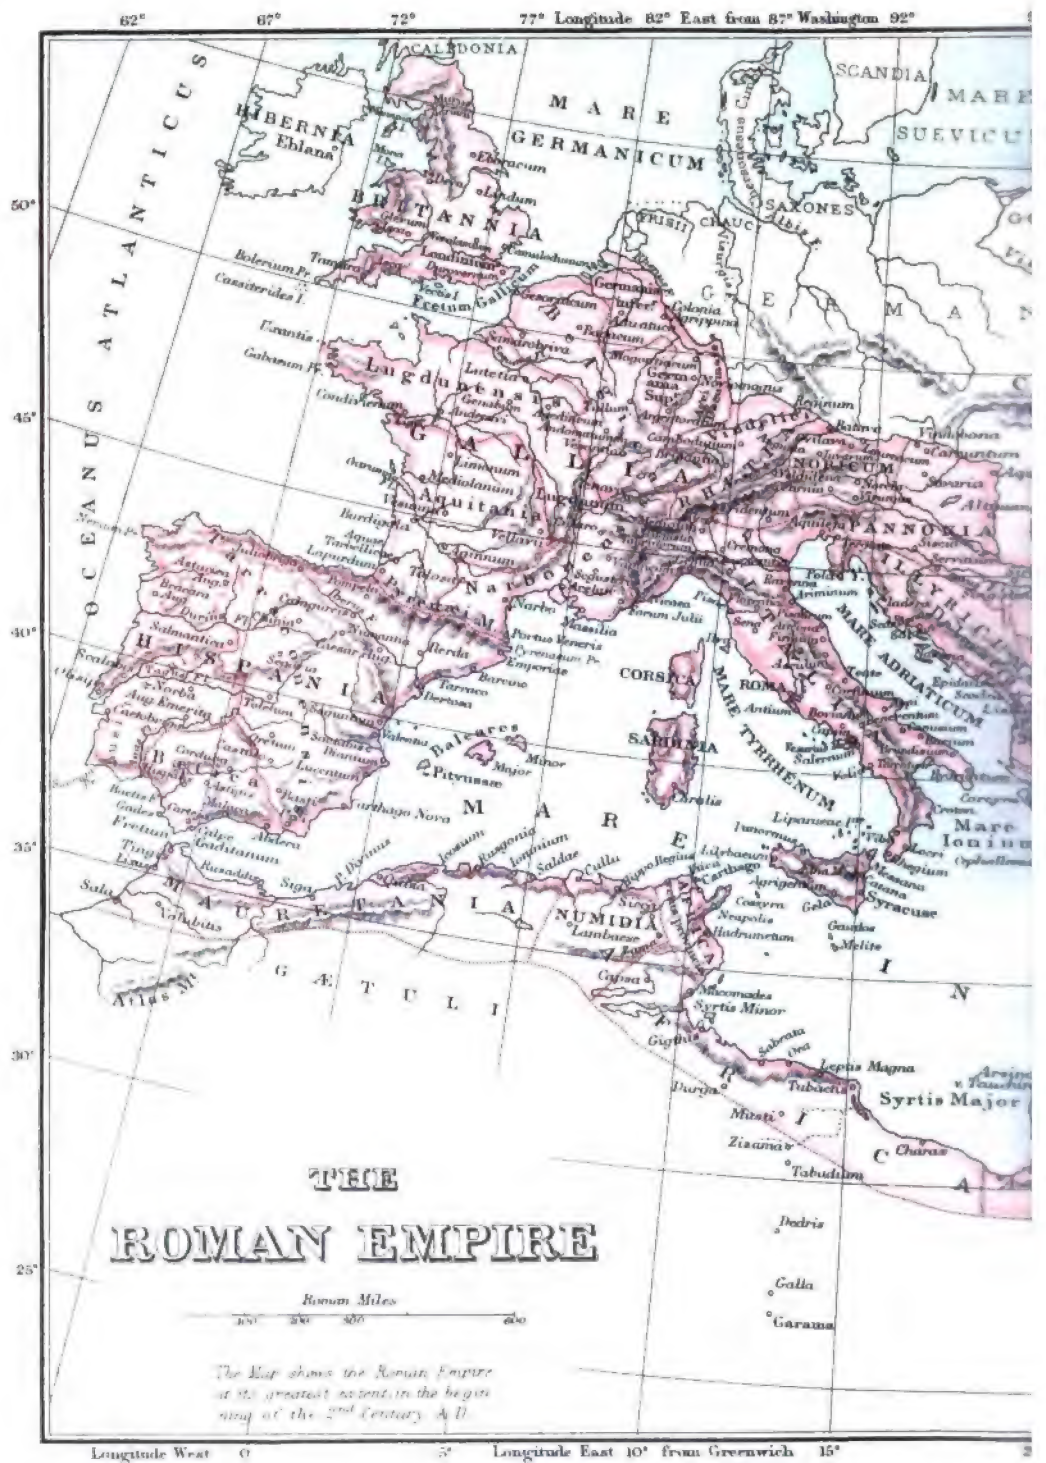

the loyalty of the peoples of Central Italy. The defeat of his brother Hasdrubal on the Metaurus destroyed Hannibal's hope of re-enforcements, and he was compelled to return to Africa, where the victory of the Roman general Scipio at the battle of Zama put an end to the war. Spain was ceded to Rome, and the political and commercial supremacy of Carthage was at an end.

The alliance of Philip of Macedon with Hannibal gave Rome a pretext for interference in the East, and the second Macedonian war resulted (197) in the destruction of the Macedonian supremacy in Greece and the independence of the Greek states. In 190 Antiochus of Syria was defeated at Magnesia and compelled to surrender Asia Minor, which went to increase the territories of Rome's allies. Illyricum became a Roman province in 167. The third Macedonian war ended in 168 in the division of the Macedonian kingdom into four republics under Roman supremacy. In 146 these republics became the Roman province of Achaia, and in the same year a desperate revolt led to the destruction of Carthage and the formation of the Roman province of Africa. In 133 Attalus, King of Pergamus, bequeathed his dominions in Asia Minor to Rome.

This rapid extension of territory was accompanied by far-reaching changes in Roman society. The increase of slavery and the growth of large estates in Italy hastened the decline of the class of small proprietors, who formed the backbone of the old Roman state. Foreigners and dispossessed farmers flocked to the capital, where they formed an idle and dangerous proletariat. In spite of the efforts of such men as Cato, the simple and austere life of earlier times gave way before the spread of a cosmopolitan Hellenism. Political institutions had not adjusted themselves to the changed conditions; Rome was trying to govern an empire with the constitution of a city. The provinces had no share in the government, and were considered a legitimate source of plunder by the governors and tax-gatherers. The senate sank "from its original high position, as the aggregate of those in the community who were most experienced in counsel and action, into an order of lords filling up its ranks by hereditary succession, and exercising collegiate misrule." Reform was imperatively needed.

*The Decline of the Republic (B. C. 133-27).*—The last century of the republic is a period of civil struggles, under the strain of which the republican constitution broke down and gave way to the empire. "It is a sign of the decay of genuine republicanism at Rome, and the approach of autocratic government, that from this time on its history centers about the names of individuals." Controversy first arose over the efforts of Tiberius Gracchus to remedy the evil growing out of the Roman land system. Elected tribune of the people in 133, Gracchus at once proposed an agrarian law which provided for the enforcement of the act of Licinius, limiting the amount of public land which any citizen could possess. Land thus held in excess of the legal amount was to be parceled out among the citizens and Italians in inalienable holdings of thirty *jugera*. The measure was only carried after the deposition of a tribune who interposed his veto; and in seeking re-election the following year Gracchus was killed by his political opponents. In 123 Gaius Gracchus brought forward a more comprehensive scheme of reform. Besides re-enacting the agrarian law of his brother, the execution of which had been suspended after farms had been given to 80,000 citizens, he struck directly at the power of the senate by restricting its control over the government of the provinces. As a counterpoise to the senate, he sought to strengthen the influence of the equestrian order, a class of wealthy capitalists to whom the collection of the provincial taxes was let. The people were won over by public sales of grain at a reduced price. Gracchus hoped to direct the policy of the state by securing his regular re-election to the tribunate, but he was defeated in 122 and soon afterward murdered. After the death of Gracchus the selfish policy of the nobles ruled supreme. The occupied public land was granted to the possessors as absolute private property, and the condition of Italy and the provinces grew steadily worse. The crowning example of aristocratic misrule is seen in the war with Jugurtha, King of Numidia, who bribed one after another of the inefficient generals sent against him. The war was finally brought to an end by Gaius Marius, a man of humble origin, whose further success in repelling the invasion of the Cimbri and Teutones made him the leading man at Rome. Marius was the first of the line of military heroes under whom the republic went out and the empire came in. He lengthened the term of enlistment and abolished the

Rhone. With scarcely an exception the emperors of this period were weak and incompetent; control passed more and more into the hands of German leaders, until in 476 Odoacer deposed the Emperor Romulus Augustulus and ruled Italy as a German king. The sovereignty of the emperor at Constantinople was nominally recognized in the West, but the real power was in the hands of the kings of the German tribes.

**AUTHORITIES.**—The best general history of the Roman republic is that of Mommsen. Use should be made of Ihne's *History of Rome* and Nitzsch's *Geschichte der römischen Republik*. For modern views on early Roman history, Niebuhr's *History of Rome*, Schwegler's *Römische Geschichte*, and Lewis's *Credibility of Early Roman History* should be consulted. Arnold's *History of Rome* follows Niebuhr on the earlier period; it is most useful for the Punic wars (to 206). Long's *Decline of the Roman Republic* is a careful narrative of the last century of the republic. Drumann's *Geschichte Roms* treats the same period biographically.

There is no work on the empire equal to Mommsen's on the republic. Merivale's *History of the Romans under the Empire* extends to the death of Marcus Aurelius, where the narrative of Gibbon's *Decline and Fall of the Roman Empire* begins. Schiller's *Geschichte der römischen Kaiserzeit* covers the period to the death of Theodosius. Duruy's *History of Rome* contains a fairly complete account of the empire. The work is particularly useful because of its illustrations. Bury's *History of the Roman Empire* covers briefly the same period as Merivale. Clinton's *Fasts Romani* is of value to the student of the chronology of the empire. Hertzberg's *Geschichte des römischen Kaiserreichs* is valuable, as are also the volumes of Ranke's *Weltgeschichte* which treat of the empire. Mommsen's *Provinces of the Roman Empire* describes an important phase of imperial history. For the years after the death of Theodosius, see Kuhn's *Städtische und bürgerliche Verfassung des römischen Reichs*, Bury's *History of the Later Roman Empire*, and Hodgkin's *Italy and her Invaders*. Among the accounts of particular periods, Gardthausen's *Augustus und seine Zeit* and Burckhardt's *Die Zeit Constantins des Grossen* should be mentioned. Representative works on the social history of the period are Friedländer's *Sittengeschichte Roms* and Schultze's *Geschichte des Untergangs des griechisch-römischen Heidenthums*.

Roman institutions are most completely presented in the great work of Marquardt and Mommsen, *Die römischen Staatsalterthümer*. Good briefer works are Mommsen's *Abriss des römischen Staatsrechts*, Schiller's *Römische Staats- und Rechtsalterthümer* (in Müller's *Handbuch der klassischen Alterthumswissenschaft*), Madvig's *Verfassung und Verwaltung des römischen Staates*, Willem's *Droit Public Romain*, and Bouché-Leclercq's *Manuel des Institutions Romaines*. Herzog's *Geschichte und System der römischen Staatsverfassung* is a valuable work which treats the Roman constitution historically as well as descriptively.

For a study of the original sources of Roman history, Schäfer's *Abriss der Quellenkunde der römischen Geschichte* gives useful material. CHARLES H. HASKINS.

## II. ROME FROM 476 TO 1870.

Upon the ruins of the ancient Roman empire, which fell in 476, there arose gradually a new empire, which soon became all the more powerful as it claimed control over the souls of men as well as over their bodies. Rome became, after a short interregnum, once more the seat of the central power in Europe, and thus earned its historic name of the Eternal City. It owed this supremacy to the gradual development of Christianity. The full supremacy of Rome as the capital of the new Church-empire may be referred to the time of Pope Gregory I. (590-604), through whose energy and political wisdom the authority of the Church was everywhere established.

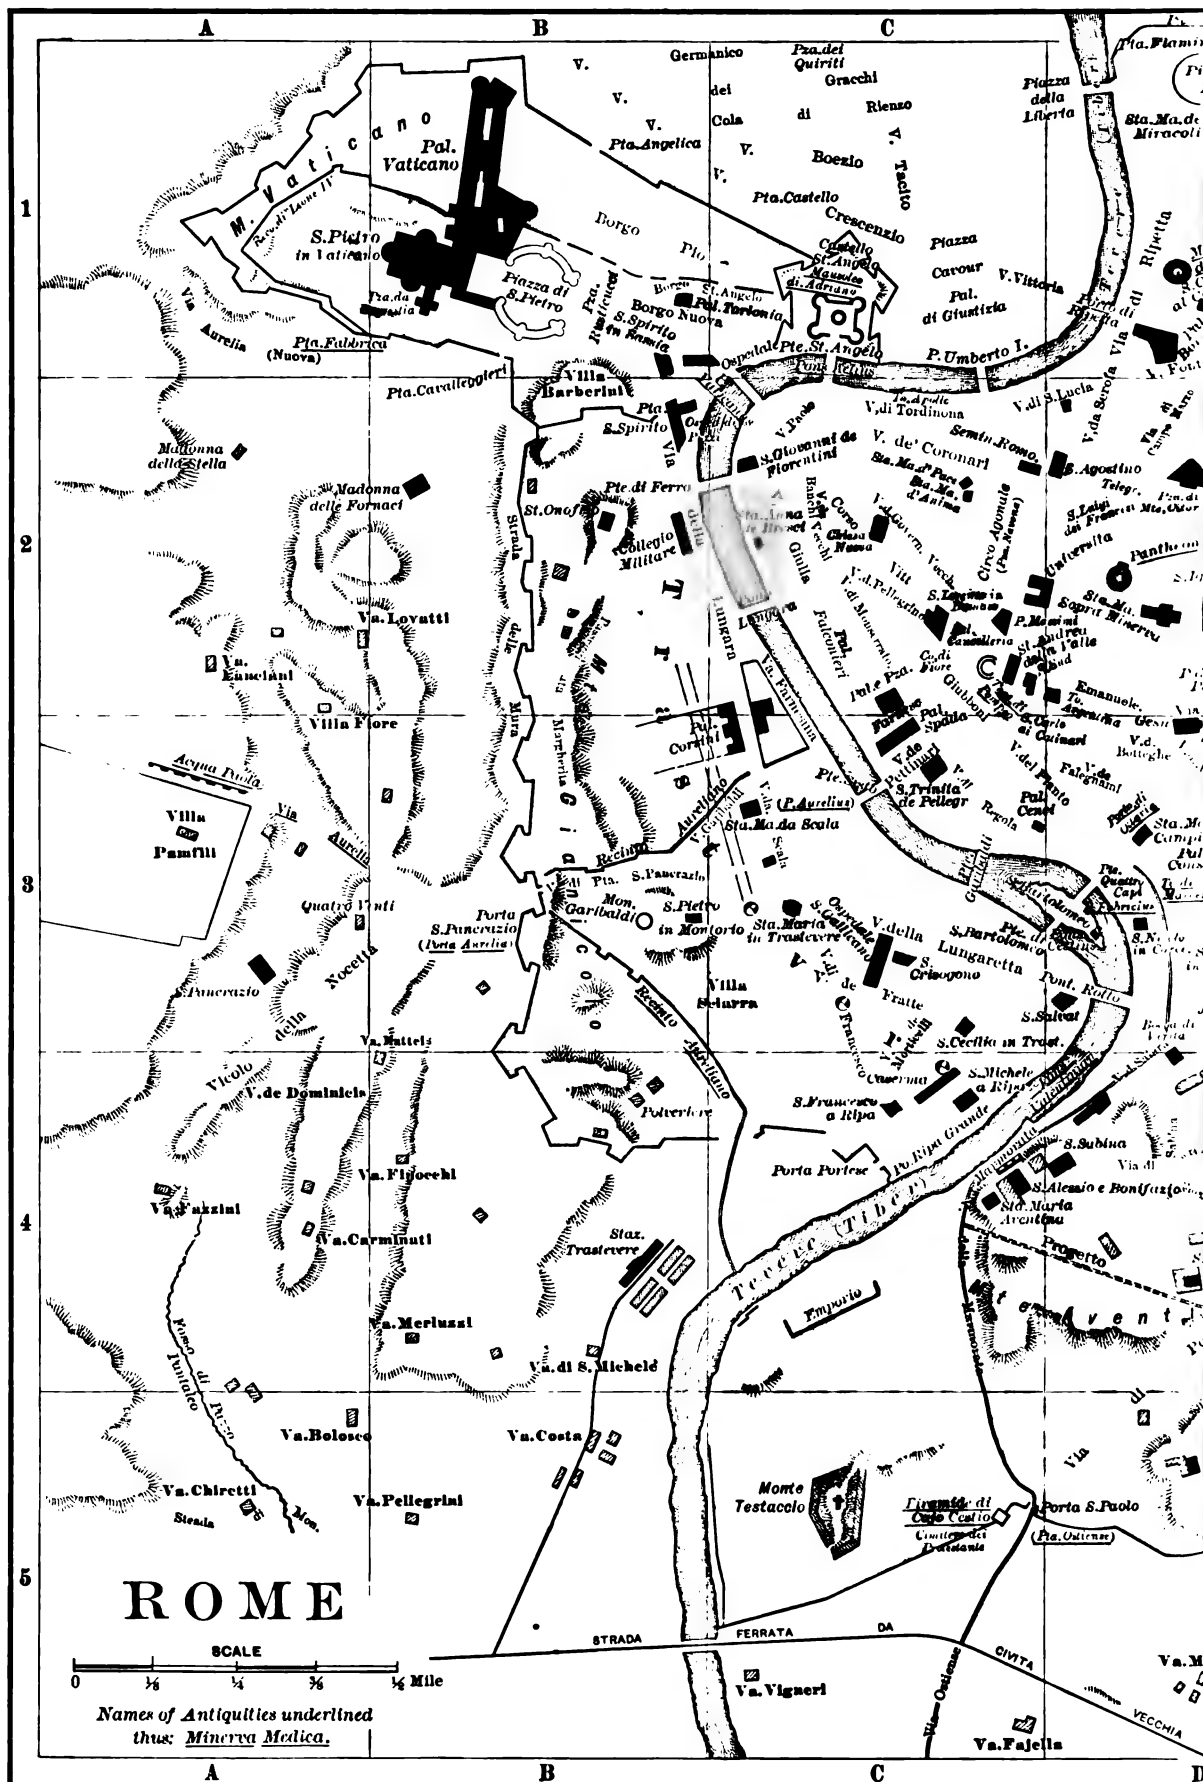

Rome itself—and with Rome the whole of Italy—had in the meantime been the easy prey of the new races which at that time broke forth from their unknown home in the East, overran the whole of Europe, and gradually obtained the supreme power. Under various names, as Goths and Germans, as Lombards, Franks, and Avars, they conquered one province after another. Large portions of Italy were laid waste, cities were sacked and razed to the ground, and whole populations butchered or carried into captivity. The surviving inhabitants remained in possession of the land, which they were forced to cultivate for the benefit of

the conquerors. The ancient laws of Rome ceased to be enforced, the municipalities became extinct, the country was divided into duchies and governed by foreign masters. Although the Lombards at no time were masters of the whole of Italy, their influence was powerful enough to give a new German character to the whole peninsula. Repeated efforts made by the Roman emperors at Constantinople to recover possession of Italy led to bloody wars, but remained unsuccessful. A greater danger threatened Rome when the Church was violently agitated by a great schism between the followers of Arius, who denied the divinity of Christ, and the Roman Catholics, who condemned Arianism. Thanks to the skillful management of Gregory the Great and his influence over Theodelinda, the Queen of the Lombards, the latter were won over to his side, Rome was saved from destruction, and Roman Catholicism became supreme in Italy. This great triumph not only relieved the Church in Rome, but enabled it to increase its strength at home and to extend its power abroad, untrammelled by the irksome authority of Greek emperors or the barbarous interference of German invaders. About the same time that the laws of the Lombards were collected (644) the decrees of councils and the canons of the Church also were codified.

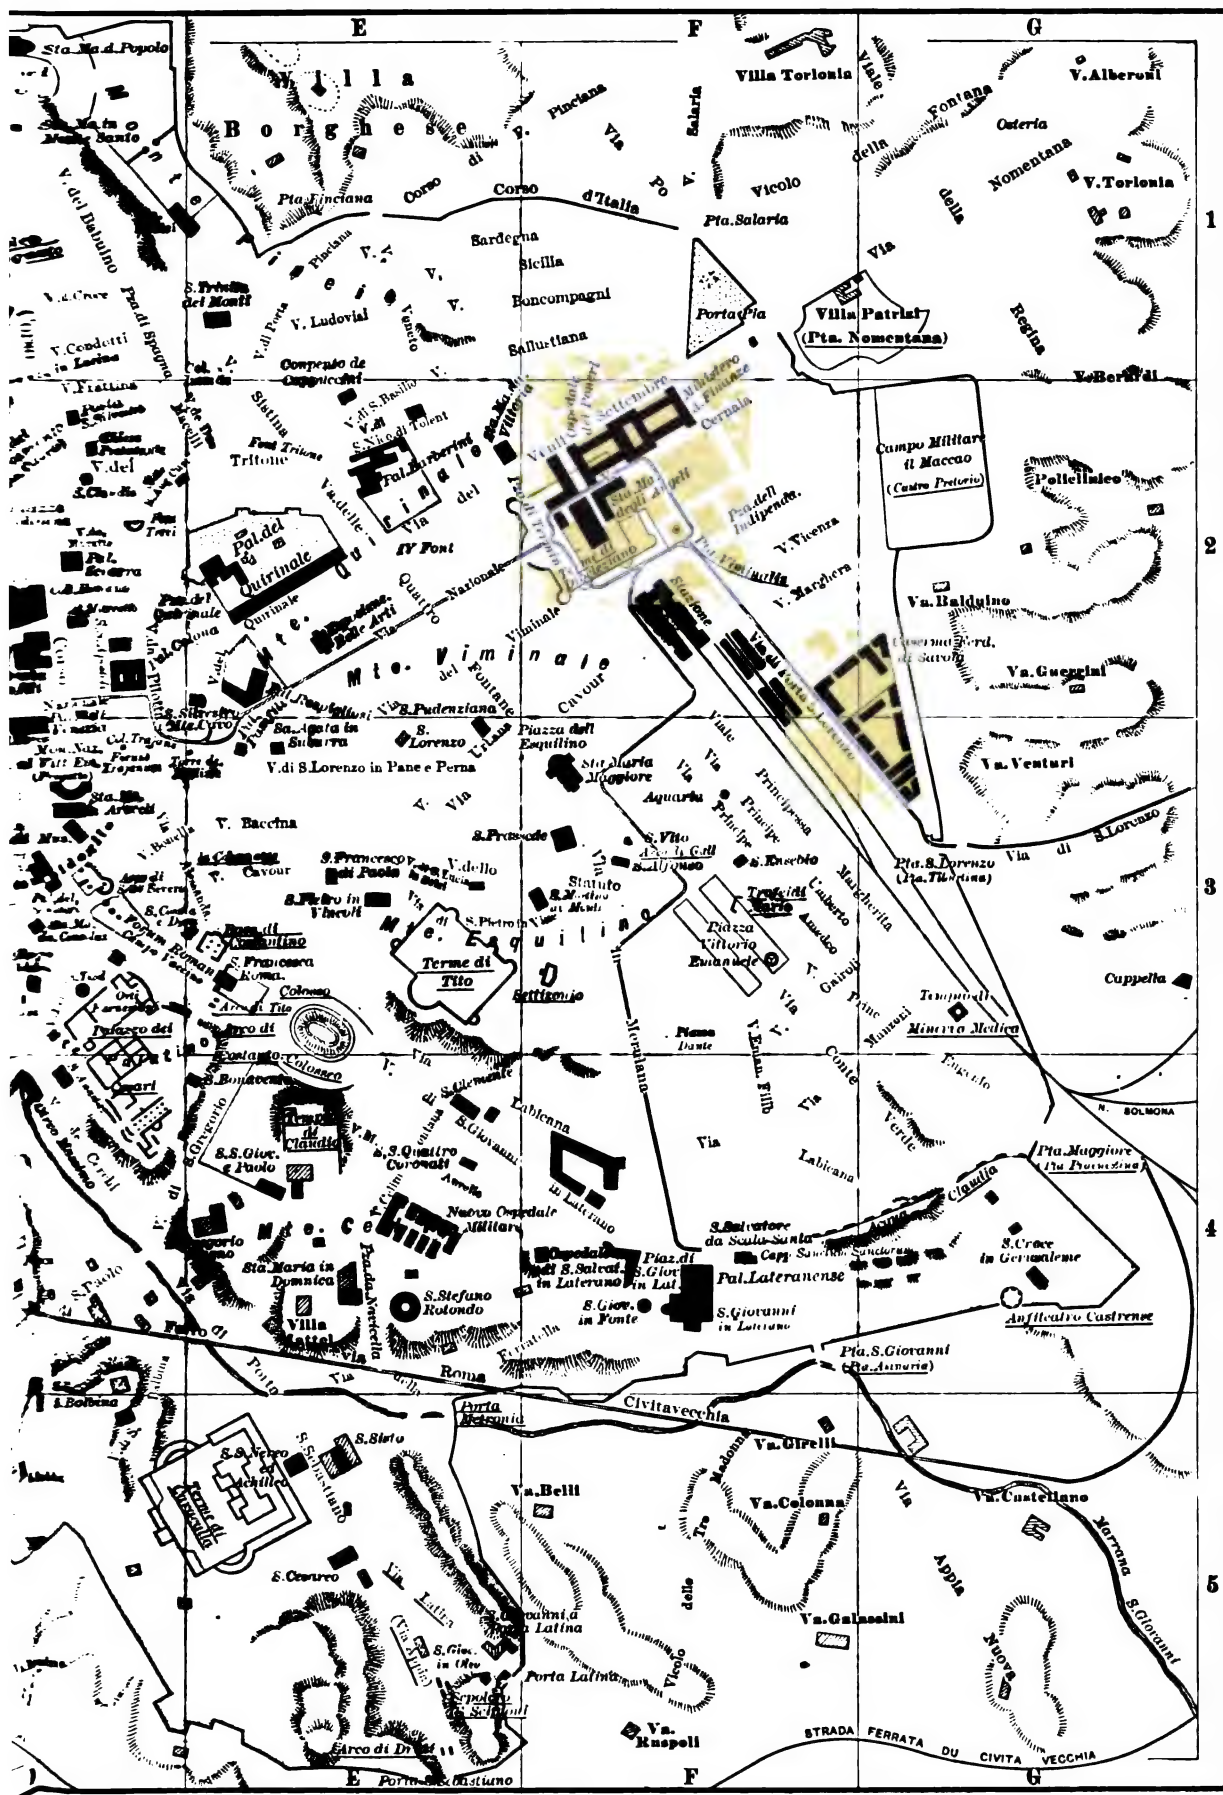

The influence of Rome grew with the power of the popes. The Germans were converted by St. Boniface, and even the Eastern nations of the Slavonic race began to acknowledge the authority of the Church, but the appeal of the Frankish king, Pepin, first established the claim of the popes to judge in secular matters as well as in matters of faith. Pepin rewarded the pope's assistance by a grant of land in Italy, and thus the foundation of the secular power of the popes was firmly laid. Pepin's successor, Charlemagne, relieved the pope of great danger, defeated his enemies the Lombards, and after several bloody campaigns entered Rome, where he accepted at the hands of Pope Leo III. the dignity of Emperor of Rome and protector of Christendom (800). It was little more than a restoration in name of the old Roman empire; Charlemagne acquired no new provinces and no new powers, but the deep-rooted reverence felt all over the world for ancient Rome was silently transferred to the new Cæsar. Thus the emperors gained much by this consecration of their power, while Rome resumed its sway over the world.

Italy was, however, not long to enjoy this newly won greatness in peace. New enemies arose on all sides, and in 846 the Saracens invaded the country and threatened Rome. Leo IV., a Roman by birth and a man of extraordinary vigor, inclosed that part of the city which has ever since been known as the Leonine City with strong walls, and made it for a time impregnable. After a period of turbulent warfare an appeal was made by John XII. to Otho, the German emperor, and the journey of the latter to Rome inaugurated a series of expeditions made by the emperors of Germany into Italy. Otho was, like Charlemagne, crowned in Rome (962), and confirmed and enlarged the donations made by his predecessors, but reserved to himself and his successors the sovereignty of Rome. Unfortunately, this divided authority led to the commission of atrocious political crimes by the popes and the three Othos, and this period of Roman history is full of shame and disgrace. The papal party and the imperial party—later known as the Guelphs and the Ghibellines—were in constant conflict, and Italy was the blood-stained battle-field on which the war was waged. At times the popes triumphed, as when the celebrated Hildebrand (Gregory VII.) compelled the Emperor Henry to do penance at Canossa, a fortress in Lombardy, and, kissing the pope's foot, to swear a formal oath of submission. Hildebrand was deposed, Rome devastated by Norman troops under Guiscard, the city burned, the inhabitants slaughtered or sold into slavery, and he himself driven to seek refuge at Salerno, where he died (1085). Crusaders, German armies, and lawless bands of soldiers ravaged Rome by turns, and in the thirteenth century, a period of unbroken faction and fighting, the city suffered fearfully. Ancient tombs and monuments were transformed into fortresses, towers were built everywhere, and the houses of the tyrannical nobles were so many impregnable strongholds. Within the walls vast districts were lying waste, gardens were planted where once stood the proudest temples and loftiest palaces, and the inhabited portions of the city were filled with perpetual tumult. The popes were confined to their castle, and yet their power abroad was greater than ever. Emperors, kings, and princes bowed before Innocent III., who claimed the government of

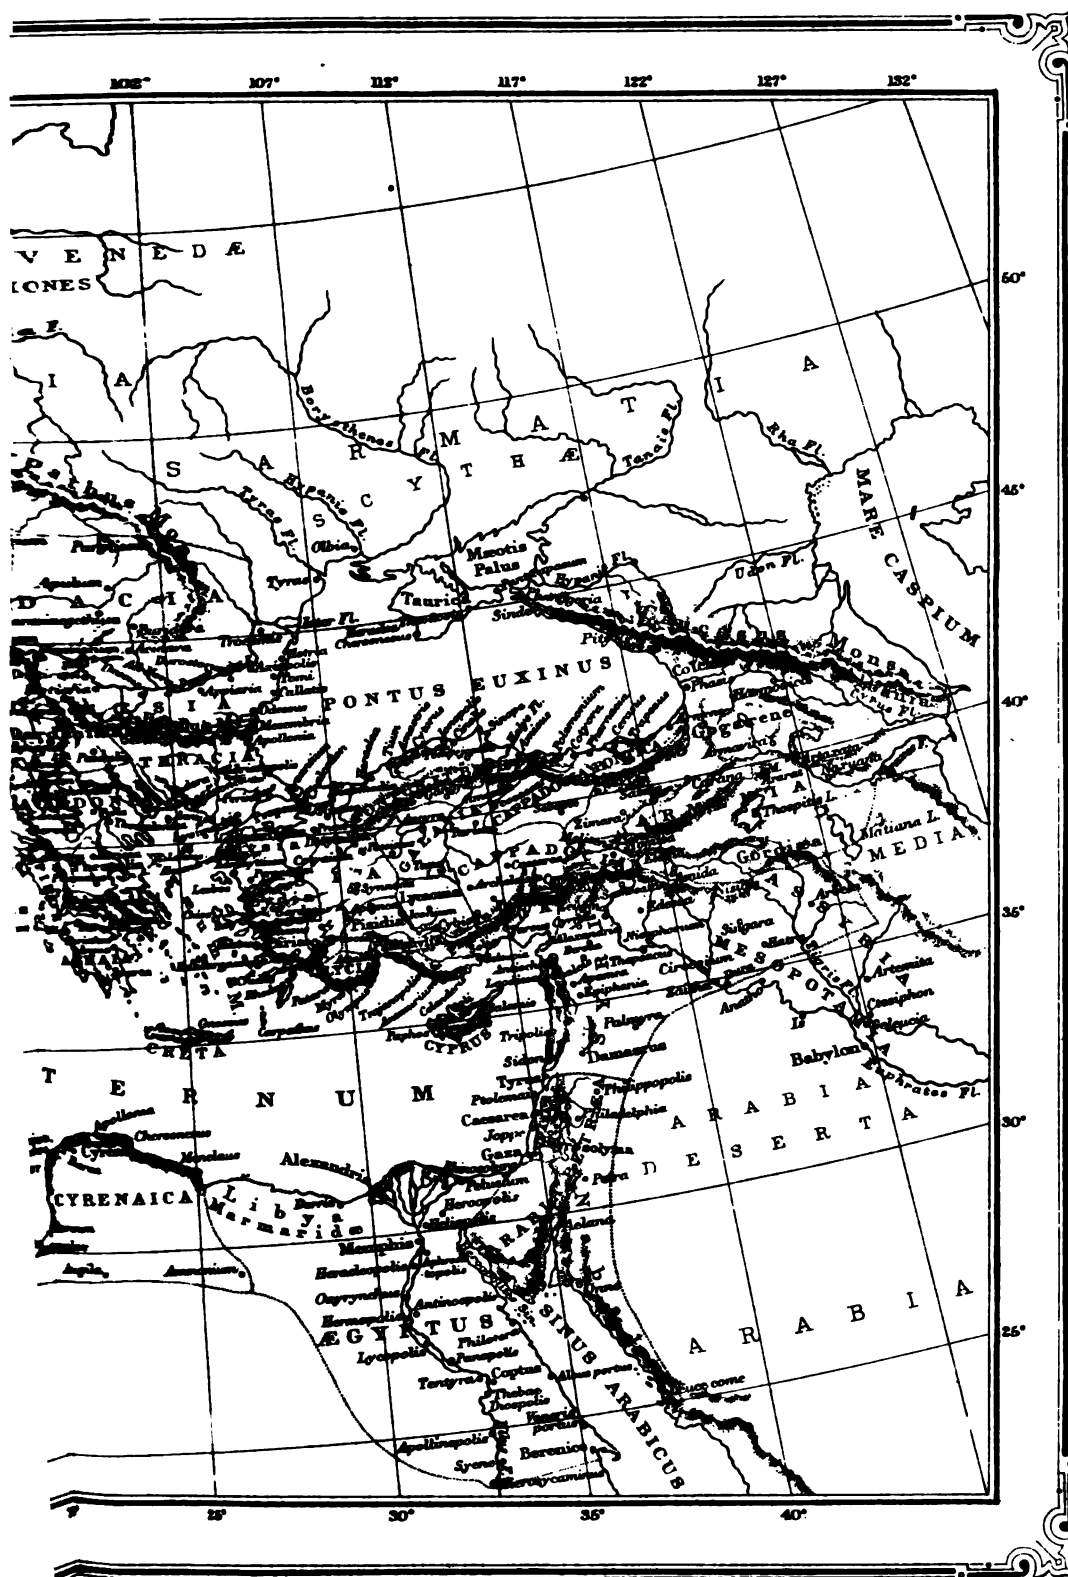

Angelo. The last structure (*Moles Hadriani*), commenced by Hadrian and finished in 140 by Antoninus Pius, was intended for a mausoleum for Hadrian and his family, and connected with the Monte Pincio by the Pons Ælius. When the Goths conquered Rome under Vitiges, it was used as a fortress, and during the feuds of the early Middle Ages constantly formed a stronghold in the hands of the ruling faction. Urban V. constructed the outworks; in 1500 the covered passage which connects it with the Vatican palace was built; and in 1527 Clement VII. sustained here a long siege, in which Benvenuto Cellini was engaged and the constable of Bourbon was killed. The later popes used the structure principally as a dungeon. The southern portion of the city on the right bank, Trastevere, occupies the ancient Mons Janiculus. Here was in the oldest time a fortified outpost against the Etruscans, and in the time of Augustus a populous suburb. The Trastevere is mostly inhabited by workmen, who claim to be the descendants of the ancient Romans. The most remarkable points here are the Church of S. Pietro in Montorio, erected in 1500 by Ferdinand and Isabella of Spain on the spot where St. Peter is said to have suffered martyrdom, and the magnificent fountain Acqua Paola, built in 1811, under Paul V., by Fontana and Maderno, after the restoration of the ancient Aqua Trajana, an aqueduct erected by Trajan for the purpose of carrying the waters of the Lago di Bracciano (*Lacus Sabatinus*), over 30 miles distant, into the city. These two portions of the western part of the city are connected by the Via della Lungara, three quarters of a mile long, constructed by Sixtus V. It contains the Villa Farnesina, which was built in 1506 by Baldassare Peruzzi, and came into the possession of the Farnese family in 1580, and the Palazzo Corsini, in which Queen Christina of Sweden died Apr. 19, 1689. The Villa Farnesina contains a celebrated series of frescoes representing the myth of Psyche, after designs by Raphael, and the Palazzo Corsini, which has been assigned by the Government to the R. Accademia dei Lincei, contains a picture-gallery, one of the largest collections of engravings in the world, and a valuable library.

The larger, eastern part of the city, situated on the left bank of the Tiber, occupies the famous seven hills. Farther to the N., near the Porta del Popolo, rises Monte Pincio (*Collis Hortorum*), 175 feet above the level of the sea, which in ancient times was covered with gardens and not reckoned a part of the city; the famous gardens of Lucullus were situated here. Here are the Pincian gardens, a fashionable drive and promenade, which command a fine view of the city. Separated from Monte Pincio by the Piazza Barberini extend the Esquiline hill, the Quirinal, and the Viminal. Farther to the S. rises the Cælian, and between this and the river the Aventine. In the southern part of the plain, between this range of hills and the Tiber, rise, isolated, two other hills—the Palatine and the Capitoline. The latter formed the most prominent point of ancient republican and imperial Rome, the principal part of which extended over the Capitoline, Aventine, Cælian, and the southern part of the Esquiline. On the Capitoline hill are the Church of Sta. Maria in Araceli, which was erected before the tenth century on the site of the temple of Juno Moneta; the Piazza del Campidoglio, designed by Michelangelo, and begun in 1536 by Paul III., with a bronze equestrian statue of Marcus Aurelius in its center; the Palazzo del Senatore, erected by Boniface IX., with steps by Michelangelo—it contains a hall for the meetings of the municipal council, offices, etc.; the Palazzo dei Conservatori, containing the Protomoteca, a collection of busts of celebrated Italians, the new Capitoline Museum, in which are antiquities chiefly found during the construction of the new streets in the east quarter of the city, and a picture-gallery founded by Benedict XIV.; and the Capitoline Museum, founded by Innocent X., which is rich in admirable specimens of ancient sculptures and other antiquities. From the Capitoline, toward the Palatine, extends the ancient Forum Romanum. The Palatine contains the ruins of the ancient imperial palaces. Between the Palatine and the Aventine lay the Circus Maximus; to the S. E. of the Aventine the baths of Caracalla. In the depression between the Palatine, Esquiline, and Cælian stands the Coliseum. (See AMPHITHEATER.) Between the Cælian and the Esquiline stand San Giovanni in Laterano, the oldest church of Christendom, and the Museum Gregorianum Lateranense. (See LATERAN.) The latter contains statues and mosaics, and a large collection of sculptures and inscriptions from the Catacombs. Near the Lateran is the building containing the Scala Santa, a flight of

twenty-eight marble steps brought from the palace of Pilate at Jerusalem by the Empress Helena in 326. Beyond the southern slope of the Esquiline the ruins of ancient Rome become scarcer and the monuments of mediæval and modern Rome more frequent. Here are the Church of Sta. Maria Maggiore, also called the Basilica Liberiana, erected by Pius Liberius 352–366, altered in 432 by Sixtus III., enlarged in 1292 by Nicholas IV., and restored in 1575 by Gregory XIII.; the Palazzo Rospigliosi, founded in 1603 by Cardinal Scipione Borghese, and the Casino Rospigliosi, containing many fine frescoes and pictures; the Palazzo Barberini, begun by Urban VIII., finished by Bernini, with a library containing 7,000 MSS. of Latin and Greek authors; the Villa Albani, built in 1760 by Cardinal Albani, with admirable works of art collected with the co-operation of Winckelmann; the railway station, opposite the Thermæ Diocletiani; and the Porta Pia, designed by Michelangelo in 1564, and restored by Pius IX. 1861–69. Through the Porta Pia the Italian army entered Rome Sept. 20, 1870.

The modern city, occupying the space between the river and the hills, is divided into two parts by the Corso, which runs in a straight line for a distance of nearly a mile from the Piazza del Popolo to the Piazza di Venezia, the finest and gayest street of the city. Among the most elegant buildings which line it on both sides are the Palazzo Doria, one of the most extensive and most magnificent palaces of Rome, containing the Doria Gallery, a large collection of pictures of different schools, and the Palazzo Colonna with rooms beautifully decorated and a collection of pictures. The portion of the city situated between the river and the Corso contains many admirable monuments, among which is the mausoleum of Augustus, erected by that emperor as a burial-place for himself and his family; it consists of an immense substructure containing the burial-chambers, and covered with a terraced mound of earth adorned with cypresses and a statue of the emperor. It was used in the Middle Ages as a fortress by the Colonnae, and is fitted up as a theater. Here is the Palazzo Borghese, built in 1590 by the elder Longhi; the Church of Sta. Maria Rotonda, or the PANTHEON (*q. v.*), the only ancient edifice in Rome which has been preserved entire. Near the Pantheon is the church of Sta. Maria sopra Minerva, erected about 1285 on the ruins of a temple of Minerva; it contains Michelangelo's *Christ with the Cross*. Here is also the Palazzo Farnese, one of the finest palaces of Rome, begun under Paul III. after the designs of da Sangallo, continued under the direction of Michelangelo, and completed by della Porta. It afterward came into the possession of the Kings of Naples, and many of the sculptures and antiquities which it contained were removed to Naples. It is now the home of the French embassy to the papal court. It contains a series of fine frescoes by Annibale Carracci and Agostino. Here are the Palazzo di Venezia (now the Austrian embassy), the Palazzo Massimo alle Colonne, containing the chapel of S. Filippo Neri, and many other palaces of the papal nobility. The splendid new streets Corso Vittorio Emanuele and Via Nazionale connect the head of the Corso with the Ponte Sant' Angelo and with the central railway station respectively. Important streets too are the Via 20 Settembre from the Porta Pia to the Quirinal, and the Via Cavour, which leads from the railway station to the Forum. From the Piazza del Popolo the Via di Ripetta diverges from the Corso on the right, and on the left the Via del Babuino leads to the Piazza di Spagna.

Among churches not already mentioned is S. Paolo fuori le Mura, originally founded in 388, burnt in 1823 and rebuilt in a magnificent style. S. Lorenzo fuori le Mura, rebuilt in 578 on the site of a church founded by Constantine, and remodeled afterward, still retains its ancient columns; Sta. Agnese fuori le Mura, founded by Constantine and rebuilt in the seventh century, has many early inscriptions; Sta. Croce is a basilica said to have been founded by the Empress Helena. S. Clemente is remarkable in that it consists of three structures—the upper one is a twelfth-century church, underground is a church of the fourth century, and below this are remains dating from the imperial and republican periods; Sta. Maria in Cosmedin retains ten of the columns of the temple of Ceres, out of which it was partly built. Outside the Porta Pia is Sta. Constanza, founded by Constantine, with mosaics of the fourth century. On the Cælian is SS. Giovanni e Paolo, founded in the fifth century and rebuilt in the twelfth; also S. Gregorio, founded in 575 on the site of the house of the father of Gregory the Great. On the Esquiline is Sta. Pudenziana, with mosaics of glass cubes dating from

**Romescot:** See **PETER'S PENCE**.

**Romilly, JOHN.** Baron Romilly of Barry: lawyer; son of Sir Samuel Romilly; b. in London in 1802; graduated at Cambridge, 1826; called to the bar at Gray's Inn 1827; sat in Parliament as a Liberal 1832-35 and 1846-52; knighted and made solicitor-general 1848, attorney-general and privy councillor 1850, and was master of the rolls 1851-72, in which capacity he was instrumental in causing the publication of the very valuable Rolls Series of *Calendars of State Papers* and other documents illustrating the earlier history of England; was made Baron Romilly of Barry, Glamorganshire, Jan. 3, 1866. D. in London, Dec. 23, 1874. Revised by F. STURGES ALLEN.

**Romilly, Sir SAMUEL:** statesman and jurist; b. in London, England, Mar. 1, 1757; entered Gray's Inn May 11, 1778; was called to the bar 1783; became eminent as a chancery lawyer, and was appointed king's counsel in 1800; chancellor of the county palatine of Durham 1805; knighted, and made solicitor-general and elected M. P. 1806; enjoyed the friendship of Mirabeau, and through him acquired the friendship and patronage of Lord Lansdowne. His great work was his attempt to reform English criminal law, which he began in 1807, and urged in Parliament with great eloquence and persistence; besides which he advocated the abolition of the slave-trade, Catholic emancipation, and electoral reform. The number of capital offenses without benefit of clergy in 1797 was 160, and it rose to 222, when the efforts of Sir Samuel Romilly for reform succeeded only so far as to have pocket-picking, which was capital if above five shillings, taken out of the list. Although his bills reducing the number of capital offenses repeatedly failed to pass, being opposed by the Government of the day, by the bishops, and even by the most eminent judges, as Lord Ellenborough, as dangerous innovations, his perseverance, his continual protesting against the severity of the criminal law, and the barbarous frequency of capital punishment (which was the cause of the laxity in its enforcement), led to the final reformation of the criminal law of England. D. Nov. 2, 1818. His speeches were published in 1820, and his biographical memoirs in 1840, with notes by his sons. He wrote *Thoughts on the Probable Influence of the Late Revolution in France upon Great Britain; Observations on the Criminal Law of England as it relates to Capital Punishments, and on the Mode in which it is administered* (London, 1810), an able pamphlet. Revised by F. STURGES ALLEN.

**Rommany Race and Language:** See **GYPSIES**.

**Romney, GEORGE:** portrait-painter; b. at Dalton, Lancashire, Dec. 26, 1734. He was apprenticed to a Cumberland painter named Steel. At the age of twenty-two he married. For some years he wandered about the north of England painting portraits—heads for two guineas, as is related—and at last went to London, leaving his wife and two children in Lancashire. From 1762 to 1798 he was either traveling on the Continent or residing and painting in London. He gained fame and popularity as a portrait-painter, and was able to secure prices as high as those paid to Reynolds, especially after Reynolds's abandonment of his art, about 1788. He was far less skillful and accomplished than either Reynolds or Gainsborough, and his pictures, other than portraits, have but little value. In 1798, broken in health, he joined his wife at Kendal, Lancashire; soon afterward he sold his studio and his collection of works of art, and settled in the north. D. at Kendal, Nov. 5, 1802. Among his best pictures are a number of portraits of the celebrated Lady Hamilton. The National Gallery in London has one of these in the character of a Bacchante, and a fancy portrait, *The Parson's Daughter*. In the National Portrait Gallery at South Kensington is another *Lady Hamilton* and a *Portrait of Flaxman*, the sculptor. Romney's portraits are mostly in private hands. RUSSELL STURGES.

**Romulus:** mythical founder of the city of Rome: the twin-brother of Remus and a son of Mars by Rhea Silvia, who was a descendant of the Trojan Aeneas, and had been made a priestess of Vesta when her father, Numitor, King of Alba Longa, was dethroned by his brother, Amulius. The two infants were thrown into the Tiber by the order of Amulius, but the river landed them safely at the foot of the Palatine Hill; a she-wolf carried them to her den and suckled them, and a shepherd afterward found them and educated them together with his own children. The legend goes on narrating how the two brethren discovered their descent, reinstated Numitor, emigrated from Alba Longa,

determined to build a city on the Palatine Hill, but then fell out with each other; how Romulus killed Remus, built the city, procured wives for the citizens, carried on many wars, and was finally translated and worshiped as a god under the name of Quirinus. It is impossible to distinguish the etiological and mythical from the truly traditional element in these stories, though there can be no doubt that the latter is present. See **ROME**. Revised by G. L. HENDRICKSON.

**Roncesvalles, rôn-thes-vaal'yés** (Fr. *Roncevaux*): a small Spanish village, province of Navarre; in a narrow valley on the southern side of the Pyrenees. It is famous as the place where Charlemagne, on his retreat from his campaign against the Mohammedans in 778, was attacked and his whole rear-guard destroyed. Among those slain in this battle was the half-mythical hero Roland, whose name became the center of the romantic poetry which sung of Charlemagne and his paladins. In the French-Spanish wars several bloody encounters (in 1793, 1794, and 1813) occurred in the same valley, and in 1833 Don Carlos was first proclaimed king here.

**Ronda:** town of Southern Spain, 42 miles W. of Malaga; at an elevation of 2,300 feet above the sea, on a precipitous promontory of the Sierra Nevada, on the Guadiaro, which here is crossed by lofty bridges built by the Moors (see map of Spain, ref. 19-D). A large annual fair is held here in May, attended by a great number of merchants, and enlivened by bull-fights. Elegant arms, fine woollen fabrics, and saddlery are the principal manufactures of the city. Pop. 19,181.

**Rondo** [from Ital. *rondò*, from Fr. *rondeau* < O. Fr. *rondel*, dimin. of *ronde*, round, a round]: in music, a composition, in which the theme, as it is given in the first strain, returns upon itself in the last, after passing through various expansions and elaborations.

**Ronge, rông'e, JOHANNES:** religious leader; b. at Bischofswalde, Prussian Silesia, Oct. 16, 1813; studied theology at Breslau; appointed a chaplain at Grottkau in 1840, but was opposed by the ultramontane clergy on account of his liberal views, and was suspended in 1843 because of an article, *Rom und das breslauer Domkapitel*, which he published in the *Sächsische Vaterlandsblätter*. In 1844 he was excommunicated on account of a letter to Bishop Arnobius, denouncing as idolatrous the exhibition at Treves of the holy coat. Through a number of pamphlets, and by traveling from town to town preaching and lecturing, he exhorted people to secede from the Roman Catholic Church, and, supported by the general irritation against the ultramontane hierarchy he succeeded in forming several congregations of the so-called German Catholic denomination. By degrees he was himself attracted by the political fermentation, sided in 1848 with the radicals, and fled in 1849 to England. Returning in 1861, he lived at Breslau and Frankfurt-on-the-Main, where he founded a reform association in 1863; after 1873 at Darmstadt. D. in Vienna, Oct. 26, 1887. Revised by S. M. JACKSON.

**Rō'nins** [Jap., liter., wave-men]: Japanese warriors not in the service of any lord. As the ordinary *samurai* (q. v.) received regular pay, the ronin was without resources and usually lived by highway robbery; he would offer himself for any reckless deed of daring. The story of the *Forty-seven Ronins* is the most tragic in Japanese history, and has been well told by Mitford in *Tales of Old Japan*. It is the story of certain *samurai*, who, having been turned adrift by the death and disgrace of their lord, finally avenged his death, and then committed suicide by *hara-kiri* at his grave.

J. M. DIXON.

**Ronsard, rôn'saar', PIERRE, de:** poet; b. at the Château de la Poissonnière, Vendômois, France, Sept. 11, 1524; was educated at the French court as page to the Duke of Orleans; followed James V. to Scotland and lived nearly three years at his court (1538-41); returned to the Duke of Orleans, and was sent on various embassies to Flanders, Holland, and England; ruined his health and lost his hearing, and retired to the Collège de Coqueret, where he spent seven years studying the Latin and Greek languages and literatures. Among his companions here were Balf, Belleau, Muret, Jodelle, and Du Bellay, and among them sprang up that new literary ideal whose first representative Ronsard became, and which for centuries reigned not only in France, but in all European literatures. It broke completely with the ideals and traditions of the Middle Ages and the older native literature, and substituted the classical models of the Latin and Greek literatures. Ronsard and his eager followers, styling them-

The trainshed of the Pennsylvania Railroad at Jersey City, N. J., has roof-trusses with a span of 252 feet, while its total length is 650½ feet. The roof of the St. Pancras Station in London is 690 feet long, with a span of 243 feet. The dimensions of the building for the exhibition of manufactures at the Columbian Exposition of 1893 in Chicago were 787 feet by 1,687 feet, and the main roof-trusses had a span of 368 feet.

FIG. 11.

FIG. 12.

FIG. 13.

Fig. 14 shows the iron framing of a mansard roof. These roofs (which have since their invention formed so common a feature of French architecture) of different styles, slopes, and coverings have been very generally adopted for many classes of buildings both in the city and in the country. They were at first built almost exclusively of wood and covered with slate, but the great liability to take and communicate fire has caused the use of iron and steel for framing purposes.

The coverings for roofs are made of various materials, among which may be mentioned the following: Thatch of straw, reeds, and heath, used probably in primitive times, and even in the present age, in rude dwellings; tiles of various shapes, which have been used from the Roman period to the present, and which probably covered the Saxon buildings; thin slabs of stone or flag; slate; lead, which was always used on mediæval roofs; tin, iron, zinc, copper; asphalted felt coated with a hot preparation of tar on which gravel is spread; shingles; canvas covered with cement and glass.

FIG. 14.

The principles governing the design of roof-trusses are similar to those for bridge-trusses, the main differences being in the data regarding snow and wind loads. The snow load is taken at various values, depending on climate, up to 15 or 20 lb. per square foot of horizontal area. The wind pressure on a vertical plane is taken at from 30 to 50 lb. per square foot. See the articles ARCH, BRIDGES, and STRESSES; also Greene's *Graphical Analysis of Roof Trusses* (1876); and Ricker's *Construction of Trussed Roofs* (1885).

Revised by MANSFIELD MERRIMAN.

**Rook** [O. Eng. *hrōc*: O. H. Germ. *hrūoh*: Icel. *hrōkr*; cf. Goth. *hrukjan*, to crow: Sanskr. *kruc-*, cry out, croak]: a bird (*Corvus frugilegus*) of the family *Corvidæ*, closely related to the common crow, which it also resembles nearly in size (it is a little smaller), as well as black color; but distinguished therefrom by the bill being little longer than the head, and in the adult naked at the base; the first primary is shorter than the eighth, the second shorter than the fifth, and the third and fourth are the longest. It is generally distributed throughout Europe and Eastern Asia. It lives in communities known as rookeries; these sometimes are very populous, occasionally containing from 2,000 to 3,000 nests, and a corresponding number of birds of different ages and sizes. In Great Britain they are considered by many an attractive feature in the landscape, and are therefore protected. The nests are generally made in tall trees. The female lays, early in the spring, about four or five greenish-blue and spotted eggs. The species is omnivorous, but does not trouble the farmer, like the crow. It is capable, like its congeners, of mimicking the sounds of other animals. The young are to some extent used as food in Great Britain and on the Continent.

Revised by F. A. LUCAS.

**Rooke**, Sir GEORGE: naval officer; b. near Canterbury, England, in 1650; entered the navy; was made vice-

admiral 1692; headed a daring and successful night attack in boats upon the French squadron off Cape La Hague, burning six vessels, May 19, 1692, for which exploit he was knighted and received a pension of £1,000; was appointed commander-in-chief of the navy at the beginning of the war in Spain 1702; made an unsuccessful attack upon Cadiz; destroyed the Spanish plate fleet of seventeen vessels in the harbor of Vigo 1702; participated in the capture of Gibraltar Aug. 3, 1704, and engaged the French fleet off Malaga Aug. 24, 1704, but that fleet having escaped in the night, he was severely blamed, and he retired from the service Feb., 1705. D. near Canterbury, Jan. 24, 1709.

**Roön**, rōn, ALBRECHT THEODOR EMIL, Count von: soldier; b. near Kolberg, Prussia, Apr. 30, 1803; entered the army in 1821; attended the military school of Berlin 1824-27; appointed teacher to the cadets in 1828, member of the topographical survey of the staff in 1833, teacher in the military school in 1835, and captain on the staff in 1836. In 1842 he was made a major, and subsequently took charge of the military instruction of Prince Frederick Charles. During the campaign in Baden he was chief of the staff of the Eighth Army-corps; was made a colonel in 1851, commander of the Twentieth Brigade of infantry in 1856, and commander of the Fourteenth Division at Düsseldorf in 1858. On Dec. 5, 1859, the prince-regent called him to take charge of the ministry of War, and (Apr. 16, 1861) also of the ministry of the Marine. After the war of 1866, which gave evidence of his talent for organization, he received from the king the cross of the Black Eagle and a dotation, and after the war with France (1870-71) he was made a count and received a new dotation. The office of Minister of the Marine he resigned Dec. 31, 1871. In the Prussian Government he represented a specific Prussian tendency in opposition to the German and progressive policy of Prince Bismarck, and (Dec. 21, 1872) having handed in his resignation, he was made president of the cabinet, and a few days afterward field-marshal, but resigned in 1873 and retired to his estate. D. in Berlin, Feb. 23, 1879. See von Gossler, *Graf Albrecht von Roön* (Berlin, 1879).

**Roosevelt**, ROBERT BARNWELL: Congressman and author; b. in New York, Aug. 7, 1829; studied law, and was engaged in active practice for many years, but finally devoted himself to literature, rural sports, and politics, and in 1870 was elected to Congress; became president of the New York Sportsmen's Club; was one of the State commissioners of fisheries for many years; U. S. minister to the Netherlands 1888-89; edited *The Citizen*, a weekly journal devoted to literature and politics; published *The Game Fish of North America* (New York, 1860), *The Game Birds of the Coast and Lakes of the Northern States* (1866), and similar works; and edited, with a biographical sketch, *The Poetical Works of Charles G. Halpine* (1869).

**Roosevelt**, THEODORE: politician and author; b. in New York, Oct. 27, 1858; graduated at Harvard College in 1880; member of New York State Legislature 1882-84; introduced and secured the passage of the State Civil Service Reform law and other laws establishing great reforms in the government of New York city; member of national Republican convention 1884; was Republican candidate in 1886 for mayor of New York; member National Civil Service Commission 1889; published *Hunting Trips of a Ranchman* (1883); *History of the Naval War of 1812* (New York, 1885); *Life of Thomas Hart Benton* (Boston, 1887); *Ranch Life and the Hunting Trail* (New York, 1888); *Winning of the West* (vols. i. and ii., 1889; vol. iii., 1894; vol. iv., 1895); *History of New York City* (1891); *The Wilderness Hunter* (1893).

**Root** [spec. use of *root*, origin; cf. *radicle*, from Lat. *radix*, root]: in algebra, a *root of an equation* is any quantity, whether real or imaginary, which being substituted for the unknown quantity will satisfy it; that is, make the two members equal. Every equation which contains but one unknown quantity, and whose exponents are whole numbers, can be reduced to the form

$$x^n + px^{n-1} + qx^{n-2} + \text{etc.} + u = 0, \quad (1)$$

in which  $n$  is a positive whole number.

The *root of a quantity* is another quantity which, taken a certain number of times as a factor, will produce the given quantity. If a quantity is resolved into two equal factors, one of these is the *square root*; if into three equal factors, one of these is its *cube root*; and so on. Every quantity has two square roots, three cube roots, four fourth roots, and so on. If the quantity is positive, both of its square roots are real:

est, though when exposed to the weather not the most durable, of all in common use.

In the manufacture of manila rope the first step in the foregoing description, hackling by hand, is omitted, as unnecessary; the manila is oiled to enable the harsher fiber to pass the more readily through the preparation machines,

FIG. 2.—Wire rope: A, heart; B, draw-off drum; C, friction-drum; D, driving-pulley; F, bobbins; T, top; V, tube; S, driving-shaft.

and the yarns are not tarred; the remainder of the process is the same in both cases. The size of rope is designated by its circumference; when smaller than  $1\frac{1}{4}$  inch it goes under the general name of small stuff. Three ropes laid up together form a cable or hawser of nine strands.

Wire rope may be made either of 49 coarse wires or 133 fine wires, put in 6 strands, and 7 or 14 hearts, and laid up right-handed; strands are laid left-handed. To make a 7-inch fine wire rope, as in the annexed diagram, fill the bobbins of a 6-flyer machine, similar to Fig. 1, with No. 8 wire, Birmingham gauge, and for the heart lead a single wire from its bobbin up through the vertical shaft. This will

FIG. 3.—Cross-section of wire rope of 133 wires (full size).

form a 7-wire heart for the strands. Next fill the bobbins of a 12-flyer machine (Fig. 1) with the same size wire, placing the heart just made as in the figure. Pass all the wires up through holes past the top, arrange the wires through the grooves of the top, twist them together by hand, splice in a piece of rope, and pass it five or six times around the draw-off drum. Friction-straps attached to the bobbins preserve an equal tension on the wires. Putting the machine in motion, the 7-wire heart is drawn up the shaft, and at the same time the 12 single wires are wrapped about it as the disk revolves, each separate bobbin turning on its own center in an opposite direction, so as to avoid twisting the wire. As the strand is formed it is reeled upon a bobbin. Having filled 7 bobbins, 6 are placed in a machine similar to Fig. 2,

FIG. 4.—A single strand of a 49-wire rope.

and 1 in the rear for a heart. The heart, on motion being given to the machinery, is drawn through, and the 6 strands wrapped about it, giving 1 central and 6 outer strands of 19 wires each. In making strands for wire rigging it is the practice to substitute hemp for the single wire of the heart, and to make a hemp heart for the rope. It is plain from the preceding diagram that the diameter of the required rope, divided by 15, will give the diameter of the single wire, from which, by tables in common use, the proper gauge may be found.

Fig. 4 shows the cross-section of a single strand of a

49-wire rope, the 6 strands and the heart all being of the same size. The size of the required rope being given, divide the diameter by 9 to find the diameter, and from the tables the gauge of the wire to be used. Knowing by the old rules the proper size to make a given piece of hemp rigging for a ship, the corresponding size of wire rope may be found from tables giving the comparative strength of ropes of the two materials. When flexibility is required, annealed wire is used and hemp hearts supplant the wire ones, as indicated by the deeply shaded centers of the 6 strands in Fig. 3, and a hemp heart takes the place of the central strand or wire heart (Fig. 3). In this case there will be 18 wires to each of the 6 strands, making a total of 108 wires in all, instead of 133 as before. So, in Fig. 4, if a twine heart in each strand be substituted for the wire, there would be a wire heart in the rope of 6 wires, laid up in 6 strands of 6 wires each; total, 42 wires, instead of 49, as above stated. The size of the wire, it is evident, determines the size of the rope. Steel wire is about 56 per cent. stronger than iron wire and 65 per cent. stronger than annealed iron wire. Both steel and iron wire may be galvanized without detracting from its strength. S. B. LUCE.

**Roquefort**, Fr. pron., rōk'fōr': a small town in the department of Aveyron, France; on a mountain 4,800 feet high, 10 miles S. W. of Millau (see map of France, ref. 8-F). It is famous for its cheese made from ewe-milk. (SEE CHEESE.) The limestone mountain is honeycombed with caverns, in which the cheeses are kept through the summer. Pop. about 1,000.

**Roqueplan**, rōk'plān', JOSEPH ÉTIENNE CAMILLE: painter; b. at Mallemort, department of Bouches-du-Rhône, France, Feb. 18, 1802; studied painting at Paris under Gros and Pujol; began to exhibit in 1822; attracted great attention in 1827 by two pictures for which he had chosen the subject from Walter Scott's romances, and became soon one of the leaders of the modern French school of painting. The most remarkable of his pictures are *The Amateur Antiquary*, in which there is very skillful painting of rich and varied objects of decorative art, and his genre pieces and landscapes from the Pyrenees, among which is *The Well near the Tall Fig-tree*. For several years during the latter part of his life he suffered much from ill-health. D. in Paris, Oct. 15, 1855.

**Rorqual**: same as FIN-BACK (q. v.).

**Rosa**, EUPHROSINE (*Parepa*): singer; b. in Edinburgh, Scotland, May 7, 1836; daughter of Demetrius Parepa, Baron de Boyescu, a Wallachian nobleman, and Elizabeth Seguin, a professional singer; was carefully trained by her mother; made her *début* on the operatic stage at Malta as a soprano singer; appeared with success at London 1857; married Captain Carvell of the East India service 1863; became a widow 1865; sang in the U. S. with the Bateman troupe 1865, and again 1866-67; enjoyed great popularity, especially in oratorios; married the violinist Carl Rosa 1867; organized with her husband an English opera-troupe, with which they sang in the principal cities of the U. S. 1869-72; was at the khedive's court in Egypt during the winter of 1872-73, and afterward made another tour in the U. S. (1873). D. in London, England, Jan. 21, 1874.

Revised by B. B. VALLENTINE.

**Rosa**, FRANCISCO MARTINEZ, de la: See MARTINEZ DE LA ROSA, FRANCISCO.

**Rosa**, PIETRO: archaeologist; b. in Rome, Italy, about 1815. He was educated as an architect, but as early as 1848 he became almost exclusively interested in archaeological researches in Rome and its vicinity. One of his early undertakings was a large-scale map of Latium, with the ancient sites determined, but the constant succession of new discoveries, overturning old theories, has kept this work in hand and unfinished for many years. Meantime he was busied upon the tombs of the Appian Way and their theoretical restoration. In 1861 the French Government charged him with the study of the camp of the Pretorian Guard at Albano, and of the buildings on the Palatine Hill. In 1872 and later he conducted important researches in the Roman Forum, and was director of these at the time of the discovery of the Basilica Julia. His publications are chiefly papers in the archaeological journals and monographs of no great extent, but his services as a discoverer and organizer are generally recognized. He was senator of the kingdom of Italy and a member of the Legion of Honor. D. in Rome, Aug. 15, 1891. RUSSELL STURGIS.

tion of Roscelin, and laid it before the synod. Roscelin was condemned and recanted, but continued, nevertheless, after his return to Compiègne, to propagate his tritheistic doctrines. He afterward settled as a teacher at Tours, and later at Loc-menach, near Vannes, in Brittany, and to this last period of his life belongs his controversy with Abelard. Abelard was a pupil of his, but in his *De Trinitate* (*Introductio in Theologiam*) he found it expedient, evidently with an eye to the decisions of the Synod of Soissons, to emphasize the unity of the Trinity with great strength. Enraged, Roscelin denounced him to Gisbert, Bishop of Paris, for various other heresies, and Abelard answered by a direct and violent attack (Ep. xxi.). After that time (1121) Roscelin disappears from history. The only writing of his extant is a letter supposed to be addressed by him to Abelard. It is probable that he wrote little. His importance in the history of nominalism has led to the close study of such representations of his teachings as are to be found in the writings of his opponents. See the histories of philosophy by Ueberweg and Erdmann. Revised by S. M. JACKSON.

**Roscher, WILHELM GEORG FRIEDRICH**, Ph. D.: political economist; b. in Hanover, Germany, Oct. 21, 1817; educated in Hanover and at the Universities of Göttingen and Berlin; professor at Göttingen University 1844-48; became professor at Leipzig University 1848; was Doctor Honorarius of Law in the Universities of Königsberg, Edinburgh, and Bologna; Doctor Honorarius of Political Economy in the University of Tübingen; member honorarius of the Universities of Kasan and Kiev, and *Ehrenbürger* of Leipzig University. His principal works are *De historicæ doctrinæ apud sophistas majores vestigiis* (Göttingen, 1838); *Leben, Werk und Zeitalter des Thukydides* (1842); *Grundriss zu Vorlesungen über die Staatswirtschaft* (1843); *System der Volkswirtschaft* (4 vols., Stuttgart, 1854-86; vol. i., 20th ed. 1892; vol. ii., 12th ed. 1888; vol. iii., 6th ed. 1892; vol. iv., 3d ed. 1889); *Kolonien, Kolonialpolitik und Auswanderung* (1847; 3d ed. 1885); *Ueber Kornhandel und Theuerungspolitik* (Stuttgart, 1847; 3d ed. 1852); *Zur Gründungsgeschichte des Zollvereins* (Berlin, 1870); *Geschichte der Nationalökonomik in Deutschland* (3 vols., Munich, 1874); *Andichten der Volkswirthe aus dem geschichtlichen Standpunkte* (2 vols., Munich, 1861; 3d ed. 1878); *Umriss zur Naturlehre des Cäsarismus* (1888); *Umriss zur Naturlehre der Demokratie* (1890); and *Politik, geschichtliche Naturlehre der Monarchie, Aristokratie und Demokratie* (1892). D. in Leipzig, Saxony, June 4, 1894.

**Roscius, QUINTUS**: a celebrated Roman actor, a contemporary of Sulla and Cicero, who in his youth received instruction from him, and subsequently defended him in a civil lawsuit in an oration which is still extant. He was especially great in comedy, and carried his art to the highest degree of perfection which the Roman stage ever witnessed, accumulating an immense fortune. Cicero speaks often of him, and always with enthusiasm for his art and respect for his character. D. 62 B. C. Revised by M. WARREN.

**Roscoe, Sir HENRY ENFIELD**, LL. D., D. C. L.: chemist; grandson of William Roscoe; b. in London, Jan. 7, 1833. He was educated at University College, London, and at Heidelberg; graduated at London University in 1852; appointed Professor of Chemistry at Owens College, Manchester, in 1858, and resigned in 1885. He was elected a fellow of the Royal Society in 1863, and received the royal medal of the society in 1873 for his chemical researches. In 1884 he was knighted for his services as a member of the royal commission on technical instruction; was elected Liberal M. P. for South Manchester in 1885, 1889, and 1892. He was president of the British Association in 1887, and in 1889 received the decoration of the Legion of Honor in recognition of his services at the Paris Exposition of that year. In conjunction with Prof. Bunsen he has published several investigations on the measurement of the chemical action of light, and is the author of numerous papers in scientific journals. His *Lessons in Elementary Chemistry* has been translated into several European and Eastern languages. He is the author of *Lectures on Spectrum Analysis* (1869; 5th ed. 1888), and conjointly with Prof. Schorlemmer of a *Treatise on Chemistry* (8 vols., 1877-90). R. A. ROBERTS.

**Roscoe, WILLIAM**: historian and biographer; b. near Liverpool, England, Mar. 8, 1753; was admitted to the bar 1774; began practice at Liverpool; wrote several pamphlets against the slave-trade; published in 1796 *The Life of Lorenzo de' Medici*, and in 1805 a *History of the Life and Pontificate of Leo X.*; sat in Parliament 1806-07; edited Pope's works (10 vols., 1824), and was author of many polit-

ical and miscellaneous treatises. He was distinguished for his labors in the cause of philanthropy and his encouragement of younger literary aspirants. D. at Toxteth Park, Liverpool, June 27, 1831. His *Life* (2 vols., 1833) was written by his youngest son, HENRY (1799-1836), who was distinguished at the bar, wrote numerous legal works, and was author of the *Lives of Eminent British Lawyers* (1830; often reprinted). Revised by H. A. BEERS.

**Roscom'mon**: an inland county of Ireland, in the province of Connaught, bordering E. on the Shannon. Area, 949 sq. miles (see map of Ireland, ref. 8-F). The surface is level, with the exception of the northern parts, where ranges of low hills are found; the soil is light but fertile, affording excellent pasturage in many places. Agriculture and the rearing of sheep are the principal occupations. Pop. (1891) 114,397. Chief town, Roscommon, which contains remains of a castle and a fine abbey of the thirteenth century, and has an important cattle-market.

**Roscommon, WENTWORTH DILLON**, Earl of: poet; nephew of Wentworth, Earl of Strafford; b. in Ireland about 1633; educated at Caen under Bochart; spent a large part of his life in France; obtained several offices about the court of Charles II.; went to Ireland as captain in the Guards; squandered his estate by gaming; returned to England; reformed his habits; married a daughter of the Earl of Burleigh; devoted himself to literature in conjunction with Dryden, and produced some poems, the best being the *Essay on Translated Verse* (1660); a blank-verse paraphrase of Horace's *Art Poetica* (1684); and a revision of *Dies Iræ*. D. in London, Jan. 17, 1684, and was buried in Westminster Abbey.

Revised by H. A. BEERS.

**Rose** [conjointly from O. Fr. *rose* (< Lat. *ro'sa*) and < O. Eng. *rōse*, from Lat. *ro'sa*, rose; cf. Gr. *ῥόδον*, rose]: a flowering plant of the genus *Rosa* and family *Rosaceæ*, which consists of shrubs, usually prickly, natives of the northern hemisphere from the Arctic zone to Mexico in the New World, and to Abyssinia and the Indian Peninsula in the Old. The genus is characterized by unequally pinnate leaves with serrate leaflets, or rarely simple leaves, which in one species (*R. berberifolia*) are entirely wanting. adnately stipulate petioles, and single or corymbose terminal flowers, with five foliaceous sepals imbricated in aestivation, five petals readily multiplying under cultivation, indefinite stamens, and numerous one-seeded carpels inclosed in the receptacular calyx-cup, which becomes fleshy when ripe. The most widely distributed North American species are the Michigan prairie-rose (*R. setigera*), with high-climbing branches, armed with stout, straight prickles, showy corymbose pink flowers, and globular fruit—a native of the Western and Southern States from Michigan to Louisiana and Georgia; the swamp-rose (*R. carolina*), with stems 4 to 8 feet high, armed with stout hooked prickles, corymbose pink flowers, and bristly, depressed globular fruit—a frequent inhabitant of low swampy ground from Canada to Florida and westward to the Mississippi; the dwarf wild rose (*R. lucida*), with stems 1 or 2 feet high, armed with unequal bristly prickles, mostly deciduous flowers, solitary or in clusters of two or three, and smooth globular fruit—common through Canada and the U. S., E. of the Rocky Mountains.

The sweet-brier (*R. rubiginosa*), a native of Europe, has escaped from cultivation, and become widely naturalized in the Atlantic States. The Cherokee rose (*R. sinica*), a native of China, with high-climbing branches, armed with stout hooked prickles, coriaceous evergreen leaves, and large white flowers, has been naturalized in the Southern States for over 100 years, where it is also extensively cultivated as a hedge-plant. Where sufficient room can be given it, few plants equal the Cherokee rose for winter blooming in Northern conservatories. *R. bracteata*, a native of China and Northern India, with erect branches, armed with stout recurved prickles and large, white, solitary flowers surrounded by conspicuous bracts, has also become naturalized in some of the Gulf States, where it is successfully employed as a hedge-plant, especially in deep rich soils.

From the dried petals of *R. gallica*, an Old World species of doubtful geographical limits, an infusion is made which is employed as an agreeable vehicle for tonic and astringent medicines. From the petals of *R. centifolia*, a native of the Caucasus, and *R. damascena*, whose native country is unknown, rose-water, the principal ingredient in astringent collyria, is distilled. (See ATTAR OF ROSES.) In the south of France, Egypt, and other Mediterranean

of *The Theological Library*, and projected *Rose's New General Biographical Dictionary*, a design carried into effect after his death by his brother, Henry John, and other writers. He was one of the principal founders of the Tractarian movement. Revised by W. S. PERRY.

**Rose-acacia**: an ornamental shrub, the *Robinia hispida*, of the order *Leguminosae*, growing wild in the mountains of the southern parts of the U. S. It has large, very showy, inodorous flowers of a deep rose-color in drooping loose racemes. It is common in cultivation.

**Rose-apples**: See EUGENIA.

**Rosebery**, ARCHIBALD PHILIP PRIMROSE, LL. D., Earl of: statesman; b. in London, 1847; educated at Eton and Oxford; succeeded to his title on the death of his grandfather, the fourth Earl of Rosebery, 1868; seconded an address in reply to a speech from the throne in Parliament 1871; president of the social science congress Glasgow, 1874; elected lord rector of the University of Aberdeen Nov. 16, 1878; lord rector of the University of Edinburgh Nov., 1880; Under-Secretary of State for the Home Department 1881; first commissioner of works 1884; Secretary of State for Foreign Affairs in Mr. Gladstone's government Jan. to June, 1886, and in this position won general approval for the firmness with which he conducted the difficult questions devolving upon him. He was appointed to the same post in 1892, and became Prime Minister on Mr. Gladstone's retirement in 1894. C. H. THURBER.

**Rose-bug**: a very common beetle, *Macrodactylus subspinosus*, of North America, belonging to the family *Scarabaeidae*. It is small and dusky yellow, and is very destructive, not only to the rose, but to other vegetation. In warm weather it will suddenly appear in swarms and then suddenly disappear again, having completed its devastations, against which there seems to be no effectual remedy. In some cases air-slacked lime scattered over the bushes and under them seems to have the desired effect, but in other cases it has proved a complete failure. The same may be said of syringing the bushes with a decoction of whale-oil soap or of aianthus leaves.

**Roseburg**: city; capital of Douglas co., Ore.; on the Umpqua river, and the S. Pac. Railroad; 76 miles S. of Eugene City, 197 miles S. of Portland (for location, see map of Oregon, ref. 6-B). It is in an agricultural, stock-raising, fruit-growing, and mining region; is an important market for the fertile Umpqua valley; and contains flour-mills, breweries, wagon-shops, the Oregon State Soldiers' Home, a national bank with capital of \$50,000, a private bank, and a semi-weekly and a weekly newspaper. Pop. (1880) 822; (1890) 1,472; (1894) estimated, 2,500.

MANAGER OF "REVIEW."

**Rose'crans**, WILLIAM STARKE: soldier; b. at Kingston, O., Sept. 6, 1819; graduated at the U. S. Military Academy; promoted brevet second lieutenant of engineers July 1, 1842. With the exception of four years (1843-47), when he was at West Point as Assistant Professor of Engineering and of Natural and Experimental Philosophy, he was engaged in the construction of fortifications until Apr. 1, 1854, when he resigned from the army and established himself in Cincinnati, O., as civil engineer and architect; was president of a coal company in Virginia 1855-57, and engaged in the manufacture of kerosene in Cincinnati 1857-61. As volunteer aide to Gen. McClellan he served in organizing Ohio State troops; was appointed colonel and chief engineer of Ohio June 9, and colonel Twenty-third Ohio Volunteers June 10, 1861. He was commissioned brigadier-general in the regular army, and in the West Virginia campaign commanded a brigade at Rich Mountain, July 11; succeeded to command of the department of the Ohio on July 21, and of the department of West Virginia in Sept., 1861; appointed major-general of volunteers Mar., 1862; in May he commanded a division of the Army of the Mississippi at the siege of Corinth; succeeding to command of that army in June, he fought the battles of Iuka (Sept. 19) and Corinth (Oct. 3-4); was transferred to the command of the Army of the Cumberland Oct. 27. His exertions did much to win the battle of MURFREESBORO (q. v.), fought Dec. 31, 1862-Jan. 3, 1863, after temporary reverse on the first day. Advancing on Tullahoma June 24, he occupied Bridgeport and Stevenson July 24; crossed the Cumberland Mountains, and Sept. 19-20 fought the battle of CHICKAMAUGA (q. v.), where, defeated and falling back on Chattanooga, he was relieved Oct. 30, 1863 (see CHATTANOOGA,

and BATTLE OF); was placed in command of the department of the Missouri Jan., 1864; repelled the invasion of Missouri by Price; was mustered out of the volunteer service in 1866; again resigned from the army 1867; was for a short time (1868-69) U. S. minister to Mexico, after which he became a resident of San Rafael, Cal., and was in Mexico 1871-73, engaged in an unsuccessful effort to negotiate the construction of a vast system of narrow-gauge railways. He was member of Congress from California 1881-85, and register of the Treasury 1885-93. On Mar. 2, 1889, he was restored to the rank of brigadier-general and retired. Revised by JAMES MERCUR.

**Rose-gall**: See GALL INSECTS.

**Ros'egger**, PETRI KETTENFEIER: poet and novelist; b. at Alpl, a small village in the Styrian Alps, July 31, 1843; passed his youth in great poverty and was apprenticed to a tailor at the age of seventeen. Through the aid of a number of patrons, whose attention he attracted by his exceptional poetic talent, he was enabled to make up for his defective education and devote himself entirely to literature. In 1869 he published his first book, *Zither und Hackbrett*, a collection of poems in the Styrian dialect, which met with success. Since then he has produced a great number of stories, sketches, and novels, most of which describe the peasant life of his native country with great originality and power of characterization. The best known of his stories are *Aus dem Walde* (1874); *Geschichten aus den Alpen* (1873); *Der Gottsacker* (1883); *Jacob der Letzte* (1888); *Huch vom Dachstein* (1892); *Peter Mayr* (1894). JULIUS GOEBEL.

**Rosellini**, ros-el-lee'née, IPPOLITO: Orientalist; b. at Pisa, Italy, Aug. 13, 1800. After graduating at Pisa in 1821, he studied Oriental languages at Bologna, and in 1824 was made Professor of Oriental Philology in the University of Pisa. Having been commissioned by the Grand Duke of Tuscany to examine the antiquities of Egypt, he visited that country and spent fifteen months (1827-28) with Champollion, who was under appointment by the French Government, in careful exploration. After the death of Champollion, Rosellini became to some extent his literary executor. The remainder of his life, after his return from Egypt, was spent in editing and publishing his monumental volumes, *I Monumenti dell'Egitto e della Nubia* (9 vols. octavo, and 3 vols. folio, containing 394 plates, Pisa, 1832-44). Ungarelli's *Elementa linguae Aegyptiacae vulgo Copticae* (Pisa, 1837) contained the material delivered by Rosellini, who in turn depended upon Champollion's *Grammaire Copte*. D. at Pisa, June 4, 1843. Biographies of him were written soon after his death by Bardelli (1843), Dei (1843), and Cavedoni (1845). CHARLES R. GILLET.

**Roselly de Lorgues**, rô'ze'lee-de-lôrg', ANTOINE FRANÇOIS FÉLIX: religious writer; b. at Grasse, Alpes-Maritimes, France, Aug. 11, 1805; studied law, but soon left the bar and devoted himself to religious writing and to researches in philosophy; became a member of the Legion of Honor in 1837, and officer in 1855. His best-known works are those in defense of the Roman Catholic Church, especially *Le Christ devant le siècle* (1835; 16th ed. 1847), translated into several languages, and *La Croix dans les deux mondes* (1844; 3d ed. 1852). He also wrote several works with the purpose of obtaining the beatification of Columbus, among them *Christophe Colomb* (1856; 3d ed. 1886) and *Histoire posthume de Christophe Colomb* (1885).

**Rose-mallow**: See HIBISCUS.

**Rosemary** [by analogy of *rose* and *Mary* < M. Eng. *ros-marine*, viâ O. Fr. from Lat. *rosmarinus*, liter., sea-dew; *ros*, dew + *marinus*, of the sea, marine, deriv. of *ma res*, sea]: a labiate evergreen shrub, *Rosmarinus officinalis*, of Europe and Asia, having fragrant aromatic leaves which yield a pungent volatile oil, valued as a stimulant medicine and sometimes used as an ingredient in perfumery, in hair-dressings, and in liniments. Oil of rosemary is a principal ingredient of the perfume called Hungary water or queen of Hungary water. The shrub, which reaches a height of from 4 to 8 feet, has linear leaves which are covered beneath with a short whitish-gray down and emit a penetrating camphor-like odor; the flower is pale bluish. It grows in sunny places, on rocks, old walls, etc., in the countries around the Mediterranean, and is generally cultivated as an ornamental and aromatic shrub in the west of Europe. The rosemary may sometimes be smelled for many leagues off the Spanish coast. It affords excellent bee-pasture. Revised by L. H. BAILEY.

The stone contains a copy of a decree promulgated by the Egyptian priesthood assembled at Memphis in 195 B. C., in honor of Ptolemy V. Epiphanes (205-182 B. C.) on account of certain benefits that he had conferred upon Egypt in his eighth year, by remitting certain taxes and reducing others, by conferring privileges upon the priests and soldiers, by dedicating certain revenues to the temples, and by averting serious damage from the land by damming and regulating the waters of an unusually high Nile. According to the decree it was directed that its text be engraved in three sorts of characters upon hard stone, and set up in all Egyptian temples of the first, second, and third order, to commemorate these beneficent deeds of "Ptolemy, the saviour of Egypt." It was also directed that statues of the king should be placed in all the temples, and that a shrine containing his image in wood should be carried with those of other deified kings of Egypt in solemn processions. The first five days of the month of Thoth were set apart for the celebration of special services in his honor.

The inscriptions on this stone were similar to those on the Tablet of Tanis, also known as the Stela of Canopus, discovered at Tanis by Lepsius in 1866. The latter was set up in 238 B. C., the ninth year of Ptolemy III., Euergetes I. (246-221 B. C.) to commemorate his good deeds, and particularly his restoration of the images of the gods, which had been carried off to Mesopotamia. These texts served to confirm the results of the decipherment based upon the Rosetta Stone. In the original work of decipherment great assistance was rendered to Champollion in 1822 by inscriptions on an obelisk then recently brought from Philæ to London, which contained the names of Ptolemy Euergetes and Cleopatra, to whose identification he was led by the Greek inscriptions on the base of the obelisk. The name of Ptolemy was already known, and the decipherment of the name of Cleopatra added several alphabetic signs to those that had been previously determined on the basis of the Rosetta Stone. For an account of the decipherment, see article EGYPTOLOGY. See also Budge, *The Mummy* (Cambridge, 1893), pp. 144 ff.; Ebers, *Cicerone durch Ägypten*, ii., pp. 24 ff. Budge, pp. 109-110, gives an extensive bibliography of works bearing upon the decipherment and interpretation of the Rosetta Stone. CHARLES R. GILLET.

**Roset'ti, or Roseti, CONSTANTIN:** poet and politician; b. in Bucharest, Roumania, June 14, 1816; in the army from 1833 to 1836; wrote translations from Byron and others, and in 1843 published a volume of original poems under the title *Ceasuri de mulțumire* (Hours of Contentment). He was concerned in the political disturbances of 1848, being a secretary of the provisional government. When the uprising was put down his journal, *Pruncul român* (The Roumanian Child), was suppressed, and he went to Paris, where he was active as a political writer. After the Crimean war he returned to Roumania and founded the journal *Românul* (The Roumanian), and as an ardent liberal was influential in politics. He became a member of the chamber of deputies, and held other public positions. He urged the proclamation of independence, and the alliance with Russia against Turkey in 1877. From 1878 to 1880 he was Minister of the Interior, and was a senator at the time of his death, Apr. 20, 1885. A new edition of his poems, translations, and political writings appeared in 1885 at Bucharest. E. S. SHELTON.

**Rosewood:** (1) the beautiful and fragrant wood of several leguminous Brazilian trees of the genera *Machærium* and *Triptolemaea*, highly valued as a veneer for furniture, pianos, etc.; (2) the almost equally beautiful wood of an East Indian leguminous tree, *Dalbergia latifolia*; (3) Canary island rosewood, the fragrant woody root of the convolvulaceous *Rhodorrhiza scoparia* and *R. florida*. The last is a delightful incense, and its powder is mixed with snuff. From it is obtained the oil of rhodium, much vaunted as a charm for horses and highly prized by trappers. (4) Burmese and African rosewoods are the timber of leguminous trees of the genus *Pterocarpus*.

Revised by L. H. BAILEY.

**Rosicrucians** [Lat. *ro'sa*, rose + *crux*, *crucis*, cross]: a secret society reported to have been founded in the fourteenth century. The first mention of the society appeared in the *Fama Fraternalitatis des löblichen Ordens des Rosenkreuzes*, anonymously published at Cassel in 1614, and in the *Confession oder Bekenntniß der Societät und Bruderschaft R. C.*, published the following year. In these the most wonderful stories were told of the Rosicrucians, who were said to be possessed of the deepest wisdom, and most

potently at work for the weal of mankind. Concerning the founder of the society, Christian Rosenkreutz—his residence among the Arab and Egyptian magicians, his life in Spain and Germany as head of the new order, his death and burial—the most stirring revelations were made in a third book, *Chymische Hochzeit Christian Rosenkreutz*, which appeared at Strassburg in 1616. Some theologians considered the society a means of salvation, others the organ of a foul scheme. Some physicians thought that it would give the fulfillment of the golden prophecies of Theophrastus Paracelsus concerning an elixir of life; others, that it was only an impudent opposition to Galen. The alchemists particularly were anxious to join it, sure that it had found the philosopher's stone and could make gold, but the whereabouts of the brotherhood remained unknown. For several years the secret society of the Rosicrucians was the all-absorbing topic of the day. Some think that the books were written by Johann Valentin Andreae, simply as a satire. Of the real existence of such a society there never was found the slightest trace. Soon there arose a multitude of Rosicrucian societies, and at the end of the eighteenth century Cagliostro pretended to be a Rosicrucian. See Semler, *Impartial Collections for the History of the Rosicrucians* (Leipzig, 1768); and Waite, *The Real History of the Rosicrucians* (London, 1887).

**Rosin, or Col'ophony** [*rosin* is appar. dial. form of *resin* (see RESINS); *colophony* is from Lat. *colophonia* (sc. *resina*, resin) = Gr. *κολοφονία* (sc. *πηλιν*, resin), Colophonian resin, resin, liter., fem. of *Κολοφώνιος*, pertaining to Colophon (Gr. *Κολοφών*); the residue which is obtained by distilling off the water and volatile oil from the crude turpentine from pine-trees. The yield is from 70 to 90 per cent. of the whole. (See TURPENTINE.) It is largely manufactured, together with oil of turpentine, at Wilmington, Newbern, and Beaufort, N. C. When entirely freed from water it is translucent. The color depends upon the purity of the original turpentine and the care taken to distill at a low temperature. It is chiefly the anhydride of abietic acid.

Colophony is pale yellow and transparent (virgin rosin), or brownish yellow and translucent, according to the care taken in its preparation. It may be obtained nearly colorless by distillation with steam or some inert gas, as hydrogen, carbon dioxide, or nitrogen, under a pressure of ten atmospheres at a temperature not higher than 600° F. It has a peculiar luster, called resinous, is brittle when cold, and breaks with a conchoidal fracture; sp. gr. 1.07 to 1.08. It is insoluble in water, soluble in alcohol, ether, wood-spirit, and in fixed and volatile oils; partially soluble in petroleum. Nitric acid dissolves it, forming chiefly isophthalic acid, together with trimellitic acid and a resinous acid. It dissolves in caustic alkalies and alkaline carbonates. Colophony softens at 160° F. and melts at 275° F. At higher temperatures it gives off volatile oils, acquiring a dark color.

Colophony is extensively used in making varnishes and cements, in the calking of ships, in the preparation of plasters and ointments, and as a reducing agent in the soldering of metals. Large quantities are consumed in the manufacture of yellow soap. A well-known use of it is for covering the bows of violins to prevent the bow from slipping over the strings without producing vibration. Before the introduction of petroleum, rosin-oil was used to some extent in lamps. The rosin-spirit is sometimes used as a substitute for oil of turpentine. The viscid oil is used in paints, for the manufacture of printer's ink, in soap-making, in cheap lubricators, etc.

Revised by IRA REMSEN.

**Rosin Bible:** See BIBLE.

**Rös'kilde:** town; in the island of Sealand, Denmark; on a hill on a branch of the Isefjord. In the early Middle Ages it was a great city, the royal residence, with 100,000 inhabitants, and 27 churches and monasteries, but conflagrations, the plague, and the growth of Copenhagen destroyed its prosperity. It has a magnificent cathedral, built 1047-84, which contains many splendid monuments; the Danish kings are buried here. Pop. (1890) 6,972.

**Roslyn:** village; Queens co., Long Island, N. Y.; at the south end of Hempstead harbor, on the Long Island Railroad; 23 miles E. N. E. of Brooklyn (for location, see map of New York, ref. 8-K). It was named by William Cullen Bryant, who had a residence here and presented the village with a public hall. It has an English classical school, a savings-bank, a weekly newspaper, flour, paper, and planing mills, and canning-factories. Many New York business men have summer residences here. Pop. (1880) 1,101; (1890) 1,251; (1893) 1,409.

EDITOR OF "NEWS."

the Howland syndicate to build the Canadian Pacific Railway. He was a member of the Manitoba Legislature 1878-82, and in the latter year was elected to the Canadian Parliament.

NEIL MACDONALD.

**ROSS, GEORGE WILLIAM, LL. D.:** educator; b. in Middlesex, Ontario, Canada, Sept. 18, 1841; educated at Normal School, and became a teacher. In 1871 he was appointed county inspector of schools in East Lambton; subsequently became inspector of county model schools, and was appointed Minister of Education for Ontario Nov. 23, 1883. He was a member of the Dominion Parliament 1872-83, and since then has held a seat in the Ontario Legislature. For many years he has been a leader in temperance and prohibition movements; was an honorary commissioner at the Colonial and Indian Exhibition, London, 1885, and has been editor of the *Strathroy Age* and of the *Seaforth Expressor*.

NEIL MACDONALD.

**ROSS, Sir JAMES CLARK:** navigator; b. in London, Apr. 15, 1800; nephew of Sir John Ross; entered the navy in 1812, and accompanied his uncle on his first voyage in search of a northwest passage, and was also with Capt. Parry (1819-27) in the latter's expeditions having the same object in view, being on one occasion wrecked in the *Fury*; in 1827 was appointed commander, and in 1829 again sailed with his uncle as second in command, and was absent four years. On June 1, 1831, he discovered the position of the north magnetic pole. Promoted to be post-captain on his return, he was engaged in a magnetic survey of Great Britain and Ireland 1835-38; in Apr., 1839, was appointed to the command of the *Erebus*, and in September of that year, in company with the *Terror*, sailed for the Antarctic seas, reaching lat. 78° 10' S., the highest southern latitude ever reached. A volcano was discovered in lat. 77° 32' S., nearly 13,000 feet in height, which was named Mt. Erebus. It is in Victoria Land, discovered and named by him, and the most extensive Antarctic land yet seen. In 1844 the honor of knighthood was conferred upon him, and in 1847 he published *A Narrative of a Voyage in the Antarctic Regions*. He was a fellow of the Royal Society, and of many continental scientific bodies. D. at Aston Abbots House, near Aylesbury, Apr. 3, 1862.

Revised by C. C. ADAMS.

**ROSS, Sir JOHN, K. C. B.:** explorer; b. in the parish of Inch, Wigtownshire, Scotland, June 24, 1777; entered the navy in 1786; in Jan., 1818, received his commission as commander of the *Isabella*, and Apr. 25, in company with the *Alexander*, Lieut. Parry, sailed from London to ascertain the existence or non-existence of a northwest passage, returning in Nov., 1818; in May, 1829, again sailed in the steamer *Victory*, equipped by Sir Felix Booth, sheriff of London, but in Sept., 1830, became ice-bound in the Gulf of Boothia, making but little subsequent advance, and May 29, 1832, the *Victory* was abandoned. In Aug., 1833, the party was rescued by the *Isabella*, formerly commanded by Capt. Ross, but at that time engaged in the whaling business. He arrived in London Sept. 19, 1833, was knighted the following year, and admitted to the companionship of the Bath. From 1839 to 1845 he was consul at Stockholm; in 1850 departed, in command of the *Felix*, 90 tons, in search of Sir John Franklin, returning the following year; in July, 1851, attained the rank of rear-admiral. D. in London, Aug. 30, 1856. (See *POLAR RESEARCH*.) He published (1819) *A Voyage of Discovery, made under the Orders of the Admiralty for the purpose of exploring Baffin's Bay*, and in 1835 a *Narrative of a Second Voyage, including the Reports of Commander James Clark Ross, and the Discovery of the Northern Magnetic Pole*; also published a treatise on steam-navigation and numerous other papers.

Revised by C. C. ADAMS.

**ROSS, Sir JOHN, K. C. B.:** general; b. at Stonehouse, Cumberland, England, Mar. 18, 1829; entered the army as second lieutenant in the Rifle Brigade in 1846; served with that regiment during the Crimean war, where he won distinction and received the brevet rank of major and Turkish medal and order of the Medjidie. During the Indian mutiny he was present at the action at Cawnpur and the capture of Lucknow; subsequently commanded the Camel Corps at the capture of Calpee and in the ensuing campaign in Central India, and for his services received the rank of lieutenant-colonel, the companionship of the Bath, and a medal. He commanded the Bengal troops during the operations in the Malay Peninsula 1875-76, and was assigned to the command of a large force of Indian troops sent to the Mediterranean in 1878, when war with Russia was threatened. He afterward commanded the second division of the Cabul

army during the war with Afghanistan 1878-79, and received the thanks of Parliament and was knighted for his services. He was appointed to the command of the troops in Canada in 1888, and stationed in Halifax.

NEIL MACDONALD.

**ROSS, JOHN JONES, M. D.:** Canadian senator; b. at St. Anne de la Pêrade, Aug. 16, 1833. He is president of the Provincial College of Physicians and Surgeons; was a member of the agricultural council of Quebec 1862-40; and elected vice-president of the North Shore Railway Company 1875. He was Speaker of the Legislative Council of Quebec 1873-74 and 1876-81; commissioner of agriculture and public works 1881-82, and held this office together with that of Premier of province 1884-87. He represented Champlain in the Canadian Assembly 1861-67, the same seat in Parliament of Canada 1867-74, and was called to the Senate 1887.

NEIL MACDONALD.

**ROSS, LUDWIG:** archæologist; b. at Altekoppel, Holstein, Germany, July 22, 1806. Endowed with a traveling scholarship by the Danish Government, he went to Athens in 1822 for the scientific exploration of Greek antiquities. When about to return home, he was appointed in 1833 by the Greek Government as superintendent of antiquities of the Peloponnesus, and subsequently of the entire kingdom. In 1845 he became Professor of Archaeology at the University of Halle. Ross was one of the great pioneers in the field of Hellenic archæology, topography, and epigraphy. He traveled all over Greece, excavating, copying inscriptions, and fixing the topography of classical localities with such accuracy, scientific method, and descriptive talent that his works have retained their value. Among his many publications the following are the most important: *Wanderungen in Griechenland* (1851); *Reisen auf den griechischen Inseln des ägeischen Meeres* (4 vols., 1840-52); *Die Dämonen von Attika* (1846); *Das Theseion und der Tempel des Ares zu Athen* (1852); *Archäologische Aufsätze* (1855-61), the second volume of which also contains a biographical sketch by Otto Jahn. D. at Halle, Aug. 6, 1859.

ALFRED GUDEMAN.

**ROSS, WILLIAM:** member of privy council of Canada; b. at Bouladine island, Cape Breton, in 1825; represented Victoria in Nova Scotia Assembly from 1858 till 1867, and the same seat in the Canadian Parliament till 1874; collector of customs at Halifax 1874-88. He was sworn of the privy council Nov. 7, 1873, and was Minister of Militia and Defense from that date till Nov. 5, 1874.

N. M.

**ROSS, Sir WILLIAM CHARLES, R. A.:** painter; b. in London, England, June 3, 1794; son of a miniature-painter and teacher of drawing, from whom he received artistic training; gained a prize from the Society of Arts at the age of thirteen; in 1817 became an assistant to Andrew Robertson, an eminent miniature-painter; was appointed miniature-painter to Queen Victoria 1837; was knighted 1842; was patronized by all the court circle, and occasionally executed historical and imaginative pieces, having obtained a premium of £100 in the great cartoon competition for his *Angel Raphael discoursing with Adam* (1842). D. in London, Jan. 20, 1860.

**ROSS and Cromarty:** a northern county of Scotland, washed on the E. by the German Ocean and on the W. by the Atlantic, and bounded N. and S. by Sutherlandshire and Inverness-shire respectively. It comprises the districts of Easter and Wester Ross, the Black Isle, the island of Lewis, and the ten detached districts which formerly made up the county of Cromarty. Area, 3,078 sq. miles. Pop. (1891) 78,727. The surface is wild and mountainous, but the soil affords good pastures, on which large herds of sheep and cattle are fed; agriculture and fishing are carried on. The royal burgh of Dingwall, 166 miles N. W. of Edinburgh, is the county-town. Pop. (1891) 2,300.

**Rossano** (anc. *Roscianum*): town; province of Cosenza, Italy; on a hill near the Gulf of Taranto, which it overlooks (see map of Italy, ref. 8-H). There are quarries of marble and alabaster in the neighborhood. Fish are abundant, and silk and cotton are raised in the vicinity, as well as grain, olives, grapes, etc. The town, still walled and defended by a castle, was once a very strong fortress. Rossano is the seat of an archbishop. Pop. of commune about 18,000.

Revised by M. W. HARRINGTON.

**Rosse, WILLIAM PARSONS, third Earl of:** astronomer; b. at York, England, June 17, 1800; studied first at Trinity College, Dublin, and then at Magdalen College, Oxford, where he graduated in 1822; sat in the House of Commons as Lord Oxmantown, representing King's County from 1821

**Rossini**, ros-see'née, GIOACCHINO ANTONIO: composer; b. at Pesaro, Italy, Feb. 29, 1792. In 1807 he entered the musical school of Bologna, studying counterpoint under the Abbate Mattei, and in 1810 he produced his first opera, *La Cambiale di Matrimonio*, at Venice. Other operas, since forgotten, followed, and in 1813 his *Tancredi* excited an immense enthusiasm, first in Venice, and soon on every stage on which Italian opera was given. In 1815 he went to Naples as director of the opera, and composed among other operas *Elizabetta* (1815), *Otello* (1816), *La Gazza Ladra* (1817), *Mosè in Egitto* (1818), *La Donna del Lago* (1819), and *Zelmira* (1820); but his most celebrated production of this period is *Il Barbiere di Siviglia* (originally called *Almaviva*), first performed in Rome in 1816, and generally considered the masterpiece of the whole genre of opera buffa—irresistibly gay, and as characteristic as graceful and brilliant. *Semiramide* (1823), composed at Bologna for the Fenice theater, Venice, was not appreciated on the occasion of its first representation. Rossini went to London in 1823, and next year to Paris, where he was made successively director of the Italian opera, inspector-general of song in France, and first composer to the Grand Opera. In bringing out his old compositions on the Paris stage he felt compelled to make considerable alterations: the melodies required a greater simplicity and more character, the chorus a deeper connection with the whole organism and a fuller significance, the instrumentation greater variety and elaborateness. He made a penetrating study of his task before he ventured to represent any new composition, but when at last, in 1828, he made the attempt with *Count Ory*, and in 1829 with *William Tell*, his success was astonishing. A few days after the performance of the last work he left Paris and retired to his villa near Bologna, where he lived till 1847, declining all offers, even the most tempting, made in order to induce him to compose a new opera. In 1847 he removed to Florence, in 1856 to Paris, where he died Nov. 13, 1868. In the last forty years of his life he published only a *Stabat Mater*, and a *Messe solennelle*, which was performed at his burial. See Edwards's *Life of Rossini* (1869), and the biography by Azevedo (1865).

**Rossiter**, THOMAS PRICHARD: figure and portrait painter; b. at New Haven, Conn., Sept. 29, 1818. He was a pupil of Nathaniel Jocelyn in New Haven, and studied in Paris, London, and other places in Europe 1840-46; National Academician 1849; gold medal, Paris Exposition, 1855. Many of his portraits are excellent. He devoted the later years of his life to painting the *Life of Christ* in a series of pictures. *Rebekah at the Well* is in the Corcoran Gallery, Washington. D. at Cold Spring, N. Y., May 17, 1871. W. A. C.

**Rost**, rost, REINHOLD: Orientalist; b. at Eisenberg, Germany, Feb. 2, 1822; studied in the gymnasium at Altenburg; graduated in 1846 at Jena; went to England 1847; from 1851 instructor in Oriental languages in St. Augustine's College, Canterbury; became secretary to the Royal Asiatic Society 1863, and librarian to the India Office 1869. He prepared a descriptive catalogue of the palm-leaf MSS. in the Imperial Library of St. Petersburg 1852; edited Dr. H. H. Wilson's *Essays on the Religion of the Hindus* and on *Sanskrit Literature* (5 vols., 1859-65). Editor of the Trübner series of *Simplified Grammars* 1882-88, and of the *Oriental Record*. Revised by BENJ. IDE WHEELER.

**Ros'tock**: town of North-ern Germany; in Mecklenburg-Schwerin; on the Warnow, 9 miles from its mouth in the Baltic (see map of German Empire, ref. 2-F). It has a university founded in 1419, with a library of 140,000 volumes; many other good educational institutions; manufactures of linen, leather, and tobacco, and an active trade. Vessels which draw more than 12 feet must load and unload at Warnemünde, its port at the mouth of the Warnow. Pop. (1890) 44,409.

**Rostof'**: town of European Russia, in the government of Yaroslaf (see map of Russia, ref. 6-E). It has 33 churches and large manufactures of linen and candles, and holds an annual fair from Feb. 21 to Mar. 11, in which transactions to the amount of about 2,000,000 rubles are carried out. Pop. 17,439.

**Rostof'**: town of European Russia, government of Ekaterinoslaf; on the Don, at the beginning of its delta; founded in 1749 as a fortress, and rapidly growing into one of the commercial centers of Southern Russia (see map of Russia, ref. 10-E). Ropes, linen, leather, soap, and tobacco are extensively manufactured. Pop. (1888) 66,781.

**Rostoptchin'**, FEDOR WASILIEVICH, Count: general; b. in the government of Orel, Russia, Mar. 23, 1763; was educated at the court as a page of Catherine II.; became Minister of Foreign Affairs under Paul I., and was governor-general of Moscow in 1812, when Napoleon approached. He was long believed throughout Western Europe to have set fire to the city before leaving it to the French, but in his *La Verité sur l'Incendie de Moscou* (Paris, 1823) he denies this. It is certain, however, that he set fire to his own palace and made preparations for the burning of the magazines. D. in Moscow, Feb. 12, 1826. See Schnitzler, *Rostoptchine et Koutousof, ou la Russie en 1812* (Paris, 1863). F. M. COLBY.

**Rostra** [Lat., liter., beaks. So called because decorated with the beaks of the galleys of Antium, taken in the first naval victory of the republic, 338 B. C.]: the platform for public speaking at Rome; originally situated between the Comitia and the Forum. It was used also as a place for setting up statues of distinguished men, and on its sides were displayed some of the most important public documents, such as the laws of the Twelve Tables, international treaties, etc. At Caesar's initiative the old rostra was torn down, and a new one constructed (probably not earlier than 42 B. C.) at the west end of the Forum, before the temple of Concord. This was about 10 feet high, 80 feet long, and 33 feet deep, its great size being accounted for by the necessity of providing a place for statues, as above indicated. The rostra was restored with great magnificence in the second century A. D. (by Trajan or Hadrian). G. L. HENDRICKSON.

**Roswitha**: See HROTSVITHA.

**Rot** (in vegetable pathology): any one of many diseases of plants, all due to the attacks of fungi or other low vegetable organisms.

The *bitter-rot* of apples causes upon the surface of the mature fruit brownish or blackish spots, which at length become studded with minute black raised points. On cutting through a diseased spot it is seen to extend far into the tissues of the apple. The fungus causing this disease

FIG. 1.—a, section through black point of bitter rot; b, spore-bearing threads (highly magnified).

is *Glæosporium fructigenum*, one of the so-called imperfect fungi of the family *Melanconiaceæ*. Its threads grow parasitically through the tissues of the apple, killing the

FIG. 2.—a, grapes affected by black-rot; b, escape of the conidia; c, section showing ascospores (b and c magnified).

cells, and finally come to the surface and produce the minute black points mentioned above, in which spores are produced (Fig. 1). Spraying the fruit in August with a 1-per-cent. solution of ammoniacal copper carbonate is a preventive. Another rot of the apple is called *black-rot* from the black color of the decayed portion, in which are found little points or pustules containing spores. The fungus (*Macrosporium malorum*) is closely related to the preceding.

*Black-rot* of grapes attacks the fruit, leaves, and shoots.

before Queen Isabella, The Martyrs of the Colosseum, Cromwell breaking up Service in an English Church, his best-known pictures are suggested by American themes—*De Soto discovering the Mississippi*, *Patrick Henry before the Virginia House of Burgesses*, *The Battle of Gettysburg*. Rothermel belongs to the class of sensational artists, but his talent for composition and color gives him a high rank among these. O. B. FROTHINGHAM.

**Rothsay**, roth'sā: a royal burgh and favorite watering-place of Scotland; capital of the county of Bute; pleasantly situated at the head of a spacious and sheltered bay on the northeastern coast of the island of Bute. Though the first cotton-mill established in Scotland was located here, the place has now no industries worth mentioning. Considerable fishing, however, is carried on. Near the center of the town are the ruins of Rothsay Castle, founded in 1098. Pop. of burgh (1891) 9,034.

**Rothsay**, DAVID STEWART, Duke of: See STEWART.

**Rothrock**, JOSEPH TRIMBLE, B. S., M. D.: botanist; b. at McVeytown, Pa., Apr. 9, 1839; educated at Harvard College and the University of Pennsylvania. He has been Professor of Botany in the Pennsylvania Agricultural College and the University of Pennsylvania, and was the botanist of the U. S. geographical surveys W. of the 100th meridian, made by Lieut. Wheeler in 1873-74-75. Among his scientific publications are the following: *Morphology of the Andracium in Fumariaceae* (1863); *Revision of the North American Gaurineae* (1864); *Flora of Alaska* (1867); *Botany of the Wheeler Expedition* (1878). He has also written many papers on forestry. CHARLES E. BESSEY.

**Rothschild**, Germ. pron. rōt'shēlt, MEYER ANSELM: financier and founder of a family celebrated for its great wealth; b. at Frankfort-on-the-Main, 1743; was intended for the Jewish priesthood, but was placed in a counting-house at Hanover, whence he returned to Frankfort and started in business for himself on a small scale as a banker and broker. Devoting himself closely to his new business, he obtained a reputation for ability and integrity, and was intrusted with the money affairs of the landgrave, afterward Elector of Hesse, who during Napoleon's possession of Germany confided to Rothschild the keeping of his immense private fortune without interest. D. in Sept., 1812, leaving a large fortune to his five sons, Anselm, Solomon, Nathan, Charles, and James, who established themselves respectively in the cities of Frankfort, Vienna, London, Naples, and Paris. All of these were created in 1822 barons of the Austrian empire.—The third son, NATHAN, b. Sept. 16, 1777, who established a branch of the house in England, employed with great judgment the immense sums confided to his father, and raised the firm to the position of one of the leading banking-houses of the world. D. at Frankfort, July 18, 1836.—LIONEL NATHAN, b. Nov. 22, 1808, eldest son of Nathan, was repeatedly elected to the British Parliament, but declining to take the prescribed oath, "on the true faith of a Christian," was not admitted until the act for removing the disabilities of the Jews was passed in 1858, when he took his seat, being the first Jew admitted to Parliament. D. June 3, 1879.—His son NATHAN was raised to the peerage as Baron Rothschild in 1885. See Reeves, *The Rothschilds* (London, 1887). F. M. COLBY.

A rotifer.

**Rotifera** [Mod. Lat.; Lat. *ro'ta*, wheel + *ferre*, to bear]: a group of microscopic animals which are of interest not only on account of their motions and powers of withstanding desiccation, but from the fact that they represent as adults a structure which occurs only in the embryos of other worms. The scientific name, as well as the popular term of wheel-animalcules, is due to the fact that around the anterior end of the body is a more or less modified circle of cilia, the motions of which convey the impression of a wheel in rapid rotation. Just behind the wheel is the mouth, which communicates with a complicated apparatus of jaws (mastax) in the throat. There is a large stomach, and the vent is on the dorsal surface of the body. The nervous system consists of a ganglion above the throat, from which nerves run to all parts of the body. Eyes are not infrequently present, as well as organs apparently tactile in character. Two tubes with funnel-shaped openings into

the body-cavity serve as excretory organs. Organs of circulation and respiration are lacking. The sexes are separate and the males are usually smaller than the females, and are further characterized by the lack of intestine and vent. Most of the rotifers live in fresh water, and are noticeable because they are able to withstand prolonged drying, and upon the return of moisture again begin their active life. See Hudson and Gosse, *Rotifera* (London, 1886), and papers by Plate, Salensky, Leydig, Jennings (*Report Michigan Fish Commis.*, 1893), etc. J. S. KINGSLEY.

**Rot'teck**, KARL WENZESLAUS RODECKER, von: historian; b. at Freiburg, Baden, July 18, 1775; studied law, afterward history; was appointed Professor of History at the university of his native city; took part with much energy, though with moderation, in the opposition against the political reaction which set in after 1815; was elected to the upper chamber of Baden in 1819, to the lower chamber in 1831, and was one of the foremost men of the liberal opposition. This brought upon him the hostility of the Government, and in 1832 he was deprived of his professorship. D. at Freiburg, Nov. 26, 1840. By his *Allgemeine Geschichte* 9 vols., 1813-27 and the minor compendium of it, *Allgemeine Weltgeschichte* (4 vols., 1830-34), he exercised a great and beneficial influence on the German middle classes. Both books were often reprinted, and have been translated into several European languages. F. M. COLBY.

**Rottenstone**: a fine earth or softened aluminous stone, much employed in polishing glass and metals. True rottenstone comes from Wales and Bakewell, Derbyshire. The name is also extended so as to include tripoli and the infusorial earths. See INFUSORIAL EARTH.

**Rotterdam**: the second commercial town in Holland; on the right bank of the Maas, about 14 miles from the North Sea and 36 miles S. W. of Amsterdam (see map of Holland and Belgium, ref. 6-E). It occupies a site in the form of a nearly equilateral triangle, the base of which is the Maas and the vertex the Delft Gate. The city is intersected by numerous canals (*grachten* or *havens*), and is traversed by the Rotte, a small stream, at the junction of which with the Maas there is a large dike or dam; whence the name Rotterdam. The numerous vessels lying in the canals and harbors, which are deep enough to accommodate those of heavy tonnage and admit of their discharging their cargoes in the very heart of the city, always present a busy and picturesque scene. Along the river, which opposite the town is 30 to 40 feet deep, is a fine quay  $1\frac{1}{4}$  miles long, called the *Boompjes* (Little Trees), from a line of elms planted in 1615, now grown to a large size. Here is the birthplace of ERASMUS (q. v.), to whom a bronze statue is erected. Rotterdam is the entrepôt of a large cattle-trade with England, and the point of departure of numerous lines of steamships, and, besides being the seat of an extensive commerce with the East Indian possessions of Holland and with Europe and America, has important manufactures. The railway route between Belgium and Holland, connecting the cities of Brussels, Antwerp, Rotterdam, The Hague, and Amsterdam, crosses the Holland Deep (*Hollandse Diep*) by the great bridge at Moerdijk. Pop. (1894) 228,597.

Revised by M. W. HARRINGTON.

**Rotli**: a volcanic island of the Malay Archipelago; S. W. of Timor; in lat. 10° 40' S. and lon. 123° E.; is 36 miles long, 11 miles broad, hilly, and produces rice, millet, and maize, ebony and other valuable woods, sheep, buffaloes, horses, swine, and fowls, edible birds' nests, and wax. Pop. 64,000. M. W. H.

**Roubaix**, roo'bā': a large manufacturing town of France, department of Nord; 6 miles N. E. of Lille (see map of France, ref. 1-F). It has extensive manufactures of woolen and cotton fabrics, furniture cloth, carpets, and twists, large dye-works and tanneries, and carries on a very active trade. Pop. (1891) 114,917.

**Roubilliac**, roo'bē'li-āk', LOUIS FRANÇOIS: sculptor; b. at Lyons, France, about 1695; became a distinguished sculptor; settled in England probably during the reign of George I., and executed many important works of art, among which were the celebrated monuments of Mrs. Nightingale, that of John, Duke of Argyll, and the statue of Handel, all in Westminster Abbey, the statue of Shakspeare in the British Museum, and of Sir Isaac Newton at Cambridge. D. in London, Jan. 11, 1762.

**Rouble**, or **Ruble** [from Russ. *rubli*, ruble]: the principal Russian money of account. The rouble is equal to 100

and Public Works, among the important acts of his administration being the negotiation, with Cobden, of the commercial treaty of 1860, when the grand cross of the Legion of Honor was bestowed upon him. He was raised to the rank of senator in 1856, and in 1863 succeeded M. Billault as Minister of State, which position he resigned on the occasion of the celebrated letter of the emperor's of Jan. 19, 1867, announcing a more liberal policy, but was immediately reinstated, and the additional portfolio of Minister of Finance was confided to his charge. Following the election of May, 1869, the ministry resigned July 13, and Rouher was nominated president of the senate a week later. During the Franco-German war he was prominent, but on the downfall of the empire fled to England. Returning to France, he was arrested and held for a brief time. He became a member of the Assembly, where he took the lead of the Bonapartist party. D. in Paris, Feb. 8, 1884. F. M. COLBY.

**Roulers**, rôl'la': town of Belgium, province of West Flanders; on an affluent of the Lys, 13 miles by rail N. W. of Courtrai (see map of Holland and Belgium, ref. 10-B). It has large manufactures of linen and lace, and trade in flax, which is largely grown in the vicinity. Pop. (1891) 20,339.

**Roulette**, rôl'let' [= Fr., dimin. of O. Fr. *roule*, wheel < Lat. *rotula*, dimin. of *ro'ta*, wheel]: a game of chance played on a table in whose center is a cavity, the sides of which are firm and divided at equal distances into thirty-eight compartments painted half black, half red, and designated by the first thirty-six numbers, besides a zero and a double zero. The bottom of the cavity is movable by the aid of a handle in the form of a cross. When the banker puts the bottom in motion he throws down in the cavity a small ivory ball, and when the movement stops the ball drops into one of the painted compartments. Each end of the table is divided into spaces on which the players place the stakes they wish to risk. Each number has one, and a player betting on the winning number receives thirty-six times his stake. There are devices also by which a player may bet on two numbers, with odds of 1 to 17; three numbers, with odds of 1 to 11; or twelve numbers, with odds of 1 to 2. Finally, there are six spaces, with even odds, on which the player bets respectively that the winning number will be (1) odd, (2) even, (3) one in a red compartment, (4) in a black one, (5) less than 19, and (6) more than 18. The advantage of the bank in the first bets described is evidently as 38 to 36. For the last six methods zero counts as odd, red, and less than 19, and double zero as even, black, and more than 18; but if a player wins on either of these compartments he loses half his stake instead of receiving it double. See ROUGE-ET-NOIR.

**Roum**: See ROUMELIA.

**Rouma'nia** [from Lat. *Roman'ia*, Roman]: a kingdom of Europe, comprising the former principalities of Moldavia and Wallachia, together with the Dobrudja, a territory E. of the Danube, ceded by the Ottoman empire at the Congress of Berlin (1878). It is situated between 43° 38' and 48° 20' N. lat. and 22° 20' and 30° 15' E. lon. (see map of Turkey); bounded N. by Austria-Hungary and Russia, E. by the Pruth, which separates it from Russia, and by the Black Sea, S. by Bulgaria and the Danube, W. by the Danube, which separates it from Bulgaria and Servia, and by Austria-Hungary. Area, 48,307 sq. miles.

Roumania is a crescent-shaped territory, rising gradually from the Danube and Pruth to the inland frontier, the crest of the Carpathian Mountains, the loftiest of whose peaks, the Ciacleu or Pion, attains a height of 8,930 feet. It is drained entirely by affluents of the Danube. The principal rivers are the Aluta or Olto, 220 miles long, which rises in Transylvania, cuts through the Carpathians, and empties at Islar; the Sereth, 215 miles long, which rises in Bucovina and flows by Roman to Galatz; the Dumbovitz, on which Bucharest, the capital, is situated; and the Pruth, 247 miles long. The Danube is navigable from the Austrian-Hungarian frontier to the Black Sea for vessels of several hundred tons, and hence is a great commercial artery. The other rivers, save the Pruth, are not available for transport trade. Both salt and fresh water lakes abound in the interior, and the coast is skirted by brackish lagoons. In the Danube are over 300 islands belonging to Roumania.

The territory naturally divides into three regions: the mountainous, where are the forests and mines; the hilly, devoted to vineyards and pasturage; and the lowland or rich alluvial tracts, occupied by grain-fields, along the lower Danube and the Pruth. Sixty-eight per cent. of the total

area is productive, 29 per cent. being under cultivation, 1 per cent. for pasturage, and 17 per cent. forest. The rest is waste. The upland plain between mountains and low land is of Quaternary formation; the foot-hills of the Carpathians are of Tertiary formation, containing Pliocene and Miocene deposits, while the mountain summits represent Secondary, Primary, and Metamorphic or Azoic rocks. As the birds and mammals of similar climate, large and small, abound in the forests, and the rivers and lakes teem with every variety of fish found in Europe. The forests consist mainly of pine, oak, fir, beech, box, birch, poplar, and plane. The apple, pear, plum, and cherry are extensively cultivated, as also all the cereals and garden vegetables known to Europe. The vines are excellent. The climate varies according to situation and elevation; extremes of temperature, 98° F. and -19°. There are three distinct seasons: winter passes almost without transition into summer, just as autumn, the agreeable season lasting through November, suddenly becomes winter, when all the rivers and even the Danube are frozen over. The soil is exceedingly fertile, not exhausted by over-cultivation, and would be most productive but for the scorching and long-continued droughts of summer. The chief agricultural products are maize (average yield, 32,000,000 bush.), wheat (average yield, 30,000,000 bush.), rye, barley, oats, millet, flax, hemp, and tobacco. Various minerals are found in the valley of the Aluta; millstones, plaster, and gypsum abound; fuller's earth and hydraulic lime are common; carbonate and sulphate of sodium, sulphate of aluminium, and magnesia and native sulphur occur in certain localities. Gold, iron, copper and lead ores, as well as cobalt and arsenic, exist. Salt-works and petroleum-wells especially yield valuable returns. Live stock is a main source of wealth. In 1890 there were 594,992 horses, 926,123 swine, 2,520,380 cattle, and 5,212,380 sheep and goats.

The decimal system for money, weights, and measures was introduced in 1876. The unit of value is the lei (plu. lei) or franc. Gold is scarce, and silver the common medium of exchange. In the financial year 1891-92 the state received 180,147,096 lei and expended 168,404,894. Direct and indirect taxes furnished 80,120,000 lei; state monopolies, 45,700,000 lei; state lands, 28,453,000. The chief expenses were interest on public debt, 68,135,293 lei; war department, 40,424,072; financial department, 23,869,645; education and worship, 19,918,421. The public debt on Apr. 1, 1893, was 1,032,519,125 lei, an enormous amount for so poor a country, being nearly 200 lei, or \$40, for each inhabitant. In 1892 the imports, chiefly from Germany, Austria-Hungary and Great Britain, amounted to 380,747,296 lei; the exports, chiefly to Great Britain, Belgium, Germany, and Austria-Hungary, 285,884,057. Grain formed nearly five-sixths of the entire exports, or 251,900,000 lei; other exports were fruits and vegetables, animals and animal products, woven fabrics, lumber. Nearly half the imports were woven goods, amounting to 155,900,000 lei; other imports were metals and objects in metal, fruits and vegetables, and combustible materials. Foreign commerce is almost exclusively in the hands of foreigners. Eleven thousand and sixty-five steamers and 14,589 sailing ships, of 5,727,517 tons, entered Roumanian ports in 1892. The Roumanian merchant marine consisted in 1892 of only 30 steamers, of 1,899 tons, and 235 other vessels, of 48,801 tons. Railways, posts, and telegraphs all belong to the state. In 1893 there were 1,581 miles of completed railways, and 343 in construction. Postal communication was formerly conducted by Russian and Austrian commercial agencies, but in 1869 a regular postal service was organized. In 1892 15,645,630 letters, 4,787,565 postal-cards, and 7,960,771 newspapers and parcels passed through the mails; 1,091,819 domestic telegrams and 446,775 foreign telegrams were sent. Receipts for posts and telegraphs, 6,149,043 lei; expenses, 6,022,011 lei. Number of post-offices, 352; of telegraph stations, 411. Length of telegraph lines, 8,503 miles, generally with two wires.

The government is an hereditary constitutional monarchy. The constitution, one of the most liberal in Europe, guarantees to every Roumanian equality under the law, and liberty of conscience, with freedom of the press and right of assembly. Legislation is vested in a senate of 120 members and a house of 183 deputies. The person of the king is inviolable, but his seven ministers, of the Interior, Finance, Foreign Affairs, War, Worship and Public Instruction, Commerce and Public Works, and Justice, are responsible to the legislative bodies. The kingdom is administratively divided into the four provinces of Little and Great Wallachia with 17 districts, Moldavia with 13 districts, and

Exposed as the language has been to very different conditions from those under which the other Romance languages have developed, it is not strange that it shows some peculiar features. It has preserved some Latin words lost in the others, and has lost some which they have preserved. Its vocabulary has been much affected by foreign languages, which have also furnished it some suffixes, and have even perhaps somewhat affected its structure. Very many words are of Slavic origin, and it has also words from mediæval or modern Greek, from Turkish, Hungarian, and Albanian, while the origin of a number is unknown. A remarkable feature of the language is its post-positive article: (*un*) *socru* (a) father-in-law, *socrul*, the father-in-law; *loc*, place, *locul*, the place; *casă*, house, *casa* (from *casă* + *a*), the house. A similar use appears in Albanian and in Bulgarian. In some matters of phonology and inflexion, particularly its genitive and dative case (one form for both uses) in articles, feminine nouns, and adjectives, Roumanian is nearer to the Latin than is any other language of the family. (See ROMANCE LANGUAGES.) There are so-called neuter nouns, which are masculine in the singular and feminine in the plural; this peculiarity is due to old Latin neuter nouns. The simple parts of verbs, or those formed without auxiliaries, are the present, imperfect, preterite, and pluperfect indicative, the present subjunctive and imperative, the present infinitive, the gerund, and the past participle; this last can also be used with prepositions so as to correspond in sense to the Latin supines. The auxiliaries used for other verb forms are not always the same as those common in other Romance languages.

Apart from a few scattered words found, for example, in Slavic documents, the earliest specimens of the language preserved to us date from near the end of the fifteenth century. The first grammar was that of Klein, *Elementa lingue dacoromane sive valachice* (Vienna, 1780). Among modern works should be mentioned particularly Gröber's *Grundriss der romanischen Philologie* (i., 1888), where full references may be found; here are added some other works, in part more recent, as Tiktin, *Gramatica română* (i., 1892; ii., 1894), and *Manual de ortografia română* (1889); *Indreptări pentru ortografia română* (contains orthographical rules for schools in Bukovina, Vienna, 1893); G. Weigand, *Die Sprache der Olympo-Walachen* (1888), *Vlachio-Meglen* (1892), and *Die Aromunen*, ii., 1894 (planned for 5 vols.). A short grammar in English is Torceanu, *A Simplified Grammar of the Roumanian Language* (1883). Dictionaries: Ion Costinescu, *Vocabolaru român-francesc* (1870); L. Şăineanu, *Dicţionarul român-german* (1889); F. Damé, *Nouveau dictionnaire roumain-français* (i., A-E, 1893; ii., F-L, 1894); Hasdeu, *Etymologicum magnum Romanicæ* (in the letter B in 1895). The dictionary of the Roumanian Academy (see LAURIANU) is not to be recommended, and Cihac's *Dictionnaire d'étymologie daco-romane* (i. 1870; ii. 1879) contains many errors. Gaster's *Chrestomatie română* (2 vols., 1883) has texts with a glossary, and an introduction on the literature and the grammar. Some periodicals published in Roumania also deserve mention, as *Columna lui Traian*, *Convorbiri literare*, *Revista pentru istorie, arheologie şi filologie*, etc. See also ROMANIAN LITERATURE and the references under ROMANCE LANGUAGES. E. S. SHELDON.

**Roumanian Literature:** the literature of the people speaking the Roumanian or Wallachian language. It begins, so far as documents are preserved, about the end of the fifteenth century or the beginning of the sixteenth, with translations from the Bible, followed by other religious writings, such as catechisms, prayers, legends, etc., by legal documents, public and private, and by chronicles, of which there are many in the seventeenth and eighteenth centuries. The oldest texts published thus far are a psalter (*Psaltirea Scheiană*, i., 1889), which the editor Bianu dates in 1482 or 1485, and the Voroneţ manuscript (*Codicele Voroneţean*, edited by Sbiara, 1885), which contains a part of the Acts and of some of the Epistles, and belongs probably to about the same time. Hasdeu's *Limba română vorbită între 1550-1600*, i., 1878, ii., 1879 (commonly referred to as *Cuvinte den beţrâni* or *Cuvinte din bătrâni*), contains texts of the second half of the sixteenth century, with linguistic and literary discussions. The Roumanian Academy has published (1881), among other texts, the psalter printed in 1577 by Coresi in Transylvania (Coresi was probably of Greek descent); this was, it seems, printed from the same translation as that used in the psalter mentioned above. All these early texts have rather linguis-

tic than literary interest; but it is to be noticed that some of the religious productions were results of the Reformation, showing themselves in Transylvania through the Saxons. Of chronicles may be mentioned those of Ureche (see F. Picot's edition, *Chronique de Moldavie*, 1878-83) and Miron Costin (lived about 1628-92; two volumes of an edition by V. A. Urechiă were published, 1886-88). M. Cogălniceanu has published *Cronicele României* (1852; 2d ed. 3 vols., 1872-74).

It was not until the nineteenth century that Roumanian literature began to develop in sympathy with the literatures of the great nations of Europe. A powerful stimulus to the growth of a truly national literature has been the national spirit, developing after the French Revolution and after the changed political aspect, as Wallachia and Moldavia attained practical independence of Turkey and later became united, and finally the independent kingdom of Roumania was established. The new era began in the eighteenth century under the leadership of Roumanians in Transylvania, where they were aided by Catholic schools, from which some went to Rome to study. Klein's *Grammar* (see ROMANIAN LANGUAGE) was followed by some other grammatical writings. Klein wrote also many theological and historical works. Naturally the connection with the Romans and their language was emphasized during this period of awakening, as indeed it has been since. Other noteworthy writers are Petru Maior (about 1753-1821), whose historical work marks the beginning of a more critical period, and who was one of the authors of the lexicon published at Buda in 1825; Şincai (about 1754-1826), whose most important work is his *Cronica Românilor*, a history of all the Roumanians from the year 86 to 1741; Ienache-Văcărescu (about 1740-99), ban of Wallachia, remarkable for his grammatical work on the language, and author, among other things, of some verses. George Lazăr (1779-1823) came into Wallachia in 1816, and was allowed after a time to open a Roumanian school in Bucharest (previously the schools had been Greek); he may be considered the founder of the national schools in Wallachia. Veniamin Costache (1768-1846) and George Asachi (1788-1871) were similarly active even earlier in Moldavia; the many works of the latter (lyric verse, dramatic and historical writings) belong largely to the next period. Costache Conache (1777-1849) was distinguished for his learning, and was active in public affairs. His poems were not published until 1856 (2d ed. 1888). Budai Deleanu (1770-1830), among other things, wrote the heroi-comic *Țiganiada sau tabăra Țiganilor* (The Camp of the Gypsies).

The next period, beginning about 1830, is that in which the influence of Western Europe shows strongly, combined with a national feeling, which, however, still rests too much on pride of assumed Roman ancestry. The strongest influence is that of French, but an Italian influence shows itself in Eliade (see HÉLIADÉ), who, like Asachi in Moldavia, founded journals in Wallachia, and stirred up the youth of the country to an interest in education and literary pursuits. Since about 1860 comes the most modern period, in which the excessive admiration for French models is somewhat tempered by a wider knowledge of modern European culture, and which may be considered as introduced by T. Maiorescu's critical writings. (See MAIORESCU.) In this time are to be noticed the organization of the society Junimea (Youth) and the establishment of literary and critical periodicals, such as the *Convorbiri literare* (Literary Conversations; since 1867). Both Maiorescu and Eminescu (1850-89), the latter one of the foremost poets of modern Roumania, made themselves acquainted with German literature. Many journals and periodicals have been started in Roumania, from those of Eliade and Asachi on, for political, literary, or scientific purposes, which have had various degrees of merit and success; some of them are mentioned under ROMANIAN LANGUAGE. (See also HASDEU.) In these much of the work of modern writers first appears. Not least important are the popular songs, tales, etc., collected by Alecsandri, Ispirescu (1830-87), and others. Many of these have been translated into German, notably by the Queen of Roumania. See CARMEN SYLVA.

Only Alecsandri (or Alexandri; see ALECSANDRI) among Roumanian writers has made his name well known outside of Roumania for purely literary work; but several others are of some note in the country itself. (See ALECSANDRI, I., BOLINTINIANU, C. and I. NEGRUZZI, C. ROSETTI.) Verse has been written, among others, by G. Sion (b. 1822; has also written comedies), Şerbanescu (b. about 1830), and Vlăduţ,

12. *S. pinnatus* (Linn.)

[illegible]

Unsurprisingly, the Division of Pensions of Parliament was the only one in England, so dated probably from the late 17th or early 18th c., while the Curator or informants of the day were there long. See *Parliamentary Officers*.

Abstract Editor: Mr. Thomas and Mrs. Jones

**Ground Squirrels.**—A class of semisocial, store-room animals is located in the same area in Scotland, Switzerland, France, and other countries. It has been mistaken for the groundhog, which seems to be the proper name for the American species. In fact they were introduced from the United States to the British Isles in 1855.

George H. [?] and Dr. ADRIAN RUMSTADT, poet; both New York, Jan. 12, 1815; educated at the College of Poughkeepsie; went to study Law, was afterward admitted to the New York bar, and was for many years professor of Law in the College of Poughkeepsie; Secretary of New Orleans, and subsequently of Louisiana, being known as the Abbe Rumstادت. He wrote with equal elegance in French and English. His chief work was being *Constitutions, Powers, and Rights of the several States of the Union*, 1841, a book highly praised by the *Quarterly Review*. With *Thomas, General Poetry* (New Orleans, 1840); *Les Pecheurs de Perles* (1852); *L'Automne*, in the *Revue des Deux Mondes* (1860); and *Revue internationale*, 1861, in New Orleans, July 13, 1867.—His brother, George H. [?], born in New Orleans, Jan. 2, 1810, was educated at New York, studied law in Philadelphia, practiced in France, a number of years, *Les Merveilles de la Nature*, 1839, and *Flora de la Nouvelle Orleans* (New Orleans, 1857); he spent some years in France, and has written a work upon the *Forests of the United States*.

1901, 1902, 1903, 1904, 1905, 1906, 1907, 1908, 1909, 1910, 1911, 1912, 1913, 1914, 1915, 1916, 1917, 1918, 1919, 1920, 1921, 1922, 1923, 1924, 1925, 1926, 1927, 1928, 1929, 1930, 1931, 1932, 1933, 1934, 1935, 1936, 1937, 1938, 1939, 1940, 1941, 1942, 1943, 1944, 1945, 1946, 1947, 1948, 1949, 1950, 1951, 1952, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967, 1968, 1969, 1970, 1971, 1972, 1973, 1974, 1975, 1976, 1977, 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 25

*Castor canadensis* **Paint** village, Clinton co., N. Y., on  
the banks of the river at its mouth, and on the  
banks of the river at the foot of the hill, and Hudson, and  
the river at the foot of the hill at Flatbush,  
about 10 miles S. of P. at Flatbush,  
about 10 miles S. of P. at Flatbush, one mile of  
the river, one mile of the river, one mile of the river.

Village nearly a mile long, which, east of the river, and is presided by the Management situated on the terrace of the market. The village has a large, well-maintained market, and houses the greater part of the numerous residents of the Champani district, which are the industrial zone and food exports of the village and imports of the district. There are various zoological, ornamental, and timber and woodwork, and a large printing establishment. P. p. (1980) 1. (1980) 1.50.

**Handwritten:** 1600. Juan Martinez, poeta de las Ptas.  
Ponce, Apr. 6 1870: Thru the kindness of a friend received a lib-  
eral education and went thru his contemporaries the title of  
"prince of verse poets" by his rich, sparkling, satirical, and  
satirical and epigrams. The 4 are written with great skill and  
brilliance, but lack power, spirit, and are no longer equal  
the ones ascribed, probably poets, and the authorship of  
various beautiful poems of considerable merit to find him-  
self and hence the authorship upon the prominent San-  
cristo written testimony, and was condemned in 1742 in  
propositional handwriting. Don Blasquez Mar. 17 1744. Bol-  
liger. *Algunos ejemplos de versos*. Ponce 1829. *Quince  
brevemente* by Manuel Marti 1850. A 12 CANFIELD

to be imprisoned in a drawing-room, and in the spring of 1756 he removed to a little cottage on the skirts of the forest of Montmorency, put at his disposal by Madame d'Épinay. He soon quarreled with her and took a house at Montmorency. Thence he issued the novel, *La Nouvelle Héloïse* (1761), which, by the eloquence and authority lent to the voice of passion and the glow and fervor of a new and wonderful style, created intense enthusiasm and was read with feverish eagerness; the *Lettre sur les spectacles* (1758), condemning the theater for its moral influence; the *Contrat social* (1762), which contains the fullest statement of his political ideas, maintains radically the sovereignty of the people, and supplied the positive ideas of the Revolution; *Émile* (1762), which unfolds his fruitful views on education. This last work offended the authorities; the Sorbonne condemned it; the Parlement had it burned, and ordered Rousseau's arrest. He was warned and fled to Geneva, Neuchâtel, and finally to England (1765), where Hume gave him a refuge at Wootton. But his irritability, sensitiveness, and suspicion were sharpened by his experiences to an unhealthy degree; he fancied himself the object of a conspiracy, and fled back to France. He spent a year under a false name with the Prince of Conti and then fled from imagined pursuit to different parts of France. In 1770 he returned to Paris and resumed the copying of music for his support, still haunted by the idea of persecution. In 1777 he accepted a house on a friend's estate a few miles from Paris, and died there July 2, 1778, under circumstances that to some have suggested suicide. In 1794 his body was transported amid great popular enthusiasm to the Pantheon. The main work of the latter years of his life was his *Confessions*, one of the most remarkable works of the kind ever written, surprisingly free from reticence, and unsparing in the revelation of himself, but not always exact. It is hard to overestimate the influence of Rousseau upon his country and Europe. At the center of his ideas was his sincere belief in the goodness of nature and whatever is in accord with her. The primitive natural instincts and affections were sacred; the primitive natural state of society furnished criteria for the criticism and renewal of institutions. The sentimentalists date from him, and the view that to show that an act is natural is to prove that it is right. The standard editions of his *Œuvres* are by Musset-Pathay (23 vols., Paris, 1823-26), and by Auguis (25 vols., Paris, 1822). One must add L. Borscha, *Correspondance inédite de J. J. Rousseau* (Paris, 1858); Streckeisen-Moulou, *Œuvres et Correspondance inédites de J. J. Rousseau* (2 vols., Paris, 1861-65); H. de Rothschild, *Lettres inédites de J. J. Rousseau* (Paris, 1892). See H. Beaudoin, *La vie et les œuvres de J. J. Rousseau* (2 vols., Paris, 1871); Saint-Marc Girardin, *J. J. Rousseau, sa vie et ses œuvres* (2 vols., Paris, 1875); A. Chuquet, *J. J. Rousseau* (Paris, 1893); J. Morley, *J. J. Rousseau* (2 vols., London, 1873).

A. G. CANFIELD.

**Rousseau, Lovell Harrison**: soldier; b. in Lincoln co., Ky., Aug. 4, 1818; received little early education, but subsequently studied law at Louisville and at Bloomfield, Ind.; admitted to the bar in 1841; member of the Indiana Legislature 1844-45, and of the State Senate 1847. In the war with Mexico, as captain in the Second Indiana Volunteers, he served with gallantry at Buena Vista; returned to Louisville in 1849; became a successful criminal lawyer, and in 1860 was a member of the State Senate, where he boldly opposed the secession of Kentucky. On the outbreak of the civil war he raised the Third Kentucky Infantry, of which he became colonel Sept., 1861; appointed brigadier-general U. S. volunteers Oct. 1, 1861; was distinguished at the battle of Shiloh Apr. 7, 1862; in command of division and conspicuous for gallantry at Perryville, Ky., Oct. 8, 1862, for which he was made major-general of volunteers; participated in the battle of Murfreesboro, Dec. 31, 1862; commanded the district of Tennessee from Nov., 1863, till the close of the war. He resigned Nov. 30, 1865; member of Congress 1865, and in Mar., 1867, was appointed a brigadier-general in the regular army and breveted major-general. Assigned to command the department of Louisiana July 28, 1868, he died in New Orleans, Jan. 7, 1869. Revised by JAMES MERCUR.

**Rousseau, Philippe**: still-life and animal painter; b. in Paris, France, Feb. 22, 1816; pupil of Bertin and Baron Gros; third-class medal, Salon, 1845, first-class 1848; second-class, Paris Exposition, 1855; first-class, Paris Exposition, 1878; officer Legion of Honor, 1870. D. at Acquigny, Dec. 4, 1887. His pictures of still life are notable for excellent technical

qualities and strong sober color schemes. *Importunate* (1850) and *The Rat Retired from the World* (1885) are in the Luxembourg Gallery, Paris; and there are works in the museums at Chartres, Valenciennes, and Nantes. W. A. C.

**Rousseau, Pierre Étienne Théodore**: landscape-painter; b. in Paris, France, Apr. 15, 1812; first-class medal, Salon, 1849, Paris Exposition, 1855; medal of honor, Paris Exposition, 1867; Legion of Honor, 1852. D. at Barbizon, Dec. 22, 1887. He was the friend and fellow worker of Millet and Diaz, and worked with them at Barbizon on the borders of the Forest of Fontainebleau, finding in the forest and the surrounding country the subjects for his pictures. He was one of the greatest of the modern French painters of landscape, and his works are characterized by profound sentiment, extraordinary technical qualities, and great truth to nature. He represented detail in a marvelous fashion without sacrificing breadth or harmony of color. One of his finest works is *The Hoar Frost*, in the collection of W. T. Walters, Baltimore. The *Woods of Fontainebleau* (1885), a magnificent picture of sunset effect, and a number of other landscapes are in the Louvre. *Morning on the Oise*, a masterpiece of color-harmony and unity of effect, is in the collection of Henry Graves, Orange, N. J. W. A. C.

**Roussset, ro'ss', Camille Félix Michel**: historian; b. in Paris, France, Feb. 15, 1821; became in 1843 Professor of History at Grenoble, in 1845 at the Lycée Bonaparte, and was from 1864 to 1876 historiographer to the ministry of War. Among his works are *Histoire de Louvois* (4 vols., 1861-63); *Les Volontaires de 1791-94* (1870); *Histoire de la Guerre de Crimée* (2 vols., 1877); and *Les Commencements d'une conquête: L'Algérie de 1830 à 1840* (2 vols., 1887). He became an academicien in 1871. D. Oct. 19, 1892. A. G. C.

**Routh, rowth, Martin Joseph, D. D.**: educator and editor; b. at South Elmham, Suffolk, England, Sept. 18, 1755; graduated at Oxford 1774; became college librarian 1781, and in 1791 president of Magdalen College, which post he retained till his death at Oxford, Dec. 22, 1854. He is best known by his collection of the fragmentary writings of the Christian Fathers of the second and third centuries under the title *Reliquiæ Sacræ, sive Auctorum fere jam perditorum*, etc. (5 vols., 1814-18; new ed., 5 vols., 1846-48).

**Rove-beetles**: beetles belonging to the family *Staphylinidae*, in which the wing-covers are very short, leaving a large part of the abdomen uncovered. The beetle when irritated turns this abdomen about in such a way as to convey the impression that it is armed with a sting. The rove-beetles are small, frequently minute; they live under stones, in moss, on composite flowers, etc.

**Roveredo, rō-vā-rā-dō**: town of Austria; in the Tyrol; picturesquely situated on the Leno, near its junction with the Adige; 14 miles by rail S. of Trent (see map of Austria-Hungary, ref. 7-A). Napoleon Bonaparte here defeated the Austrians in 1796. It is the center of Tyrolean silk-manufacture and has a large transit trade. Pop. (1890) 9,030.

**Rovigno, rō-veen'yō**: town of Austria; in Istria, on a rocky promontory in the Adriatic; 40 miles S. by W. of Trieste (see map of Austria-Hungary, ref. 8-C). It has two harbors, ship-building yards, ropewalks, manufactures of sailcloth, tunny-fisheries, and an active trade in wine and oil. Pop. (1890) 9,662.

**Rovigo, rō-vee'gō**: town of Italy; province of Rovigo; lying between the Po and the Adige on the Adigetta, an emissary of the Adige; 38 miles S. W. of Venice (see map of Italy, ref. 3-D). It has an octagon-shaped church (1594), a cathedral (1606), a picture-gallery, and a town-hall with a library of 80,000 volumes. Mediæval Rovigo belonged sometimes to Venice, sometimes to the house of Este. Pop. 7,272.

**Rovigo, Duke of**: See SAVARY.

**Roving**: See COTTON MANUFACTURES.

**Rowan, rō'an, Stephen (Lugg)**: sailor; b. near Dublin, Ireland, Dec. 25, 1808; entered the U. S. navy as a midshipman Feb. 15, 1826; was distinguished for ability and courage on the west coast of Mexico during the war with that country, and during the civil war in the rivers of Virginia, the sounds of North Carolina, and at Charleston, S. C.; for his long, honorable, and gallant service received a vote of thanks from Congress; was made vice-admiral Aug. 15, 1870; became superintendent Naval Observatory, and was chairman of lighthouse board; retired Feb. 26, 1889. D. at Washington, D. C., Mar. 31, 1890. Revised by C. BELKNAP.

**Rowan-tree**: See MOUNTAIN-ASH.

The regatta of 1873 was held over the course at Saratoga, and eleven crews entered. Yale won. Columbia won the regatta of 1874 in 16:42½. In the following year the regatta was again held at Saratoga, and participated in by thirteen representative crews. Cornell won in 16:53, Harvard third, Yale fifth. In 1876 the Yale-Harvard races were again established for eight-oared shells with coxswains over a 4-mile straight-away course at Springfield on the Connecticut. Yale won by 21 sec. in 22:02. That year Yale was not present at the American College Regatta, but Harvard sent entries for all three events—University and Freshmen crews, also a single scull—each of which secured second place in their respective races, Cornell winning the three honors. Since 1876 the Yale-Harvard race has been an annual occurrence. Of the nineteen races rowed, including that of 1894, Yale has won twelve and Harvard seven. The best time has been made by Yale in 1888, being 20:10, which stands as the record for eight-oared shells over a 4-mile straight-away course. All but the first two of these latter races have been rowed at New London, Conn., with varying tide and wind. In 1883 an annual race between Cornell and the University of Pennsylvania was initiated.

Rowing at Cornell dates from 1869 with the formation of the Undine Boat Club. In 1870 the Cornell navy was organized, and has existed as such ever since. In 1873 Cornell sent her first crew to compete with other colleges in the regatta of the American Colleges Rowing Association, and was annually represented in this contest thereafter until the association came to an end. In the first two contests her crews finished fifth, but led in the latter two. In the last year of the regatta not only did the Varsity win, but also the Freshmen crew and her single sculler, Francis. Following these events, both Harvard and Yale withdrew from the association, and have declined races with other colleges since.

Since 1884 neither Cornell's Varsity nor Freshmen crews have met defeat in a series of nineteen races, the summary of intercollegiate races from 1873 to 1894, both Varsity and Freshmen included, being thirty-two victories and seven defeats.

Since the introduction of rowing as a pastime in Great Britain there has been a vast change in all the departments of the sport—in the training for a race, selection of a crew, style of rowing, and, greatest of all, in the boats. Formerly the boats were built with a proportion of breadth to length of 1 to 6, but the present usage is 1 to 30 and even 1 to 40. Their finest racing boats were about 6 ft. 2 in. beam, 35 feet in length, weighed 700 lb., and were rowed by oarsmen of 200 lb. weight, with two spare men to act as ballast and assist at the oars. A shell 24 inches beam, 66 feet long, and weighing 250 lb., can be rowed by eight men with coxswain, having total weight of 1,350 lb., at a rate of 12 miles an hour. This great reduction in width, with a corresponding increase of length and also speed, is due almost entirely to the outriggers and consequent improvement in design and materials of construction.

To Harry Clasper, probably, more than any other oarsman, credit is due for the adoption of the outrigger and many other improvements in race-boat building. In 1828 Anthony Brown had fastened various pieces of wood, now known as false outriggers, to the side of the Diamond, of

Ouseburn, preparatory to its race with the Fly, of Scotswood-on-Tyne, and in 1830 Frank Emmett had contrived a more perfect plan of iron outriggers for his boat, the Eagle, yet it was not until 1844 that Clasper's four-oared outriggered boat fully overcame the prejudice of the time, and racing boats began to be modeled with regard to the new innovation. Yet Clasper's first outriggers were but 8 inches long. To Clasper also are we indebted for improving the spoon oar.

James Mackay, who appeared in 1857 at the Portland City Regatta in a shell of his own construction, was probably the first builder of shells with outriggers in the U. S. He received an order from Harvard for a six-oared shell, which he completed in December of that year. It was 40 feet long, 26 inches amidships, built of white pine, with iron outriggers and spoon oars, and was the first six-oared shell launched in the U. S.

Another improvement which added materially to the speed of racing boats was the sliding seat, from which has been evolved the roller seat. The distance through which the seat moves varies according to the style of the stroke rowed. The sliding seat is claimed to have been first used by J. C. Babcock, of the Nassau Boat Club, in a sculling boat in 1857, but it was not until 1870 that its merits were fully appreciated. The change to roller seats was made by Charles E. Courtney in 1878, and first used by him in 1879 in a race at Toronto, Canada.

Charles E. Courtney is authority for the following general directions as to one style of stroke: The beginning of the

FIG. 1.

stroke, known as the forward reach, is illustrated in position 1. In this the seat is pulled forward with the feet until it is from within 9 to 12 inches from the bottom of the foot-

FIG. 2.

brace, the distance varying with individuals. The seat is held in position 1 while the oar catches the water, being so dipped as to just fairly cover the oar-blade, and until swinging the body at the hips the shoulders are in position 2. The shoulders go back no farther, and the stroke is finished by the legs and arms, as in position 3. The arms are kept straight until just before the legs are fully straightened, when the elbows are bent and the hands brought sharply in to the body, and are then dropped almost into the lap to bring the oar cleanly out of the water. Then the wrist is turned to

**Ruatan'**, or **Routan**: an island in the Bay of Honduras (Caribbean Sea), 80 miles from the northern coast of Honduras, to which it belongs; area about 80 sq. miles. It is long and narrow, partly hilly, wooded, and has a good soil and climate; its inhabitants (about 1,000) are engaged in fishing and turtle-catching. In 1742 this island was seized by Great Britain, and in 1797 about 5,000 Caribs were transported to it from St. Vincent; most of them since passed over to the mainland. Subsequently Great Britain gave the island to Honduras, but temporarily held it again 1841-42. Ruatan is one of the Bay islands. H. H. S.

**Rubasse**: a variety of crystallized quartz, discolored and stained with specks of red and yellow iron oxide, which give it a fine red. Artificial rubasses of all colors are made from rock-crystal heated and dipped in cold colored aniline solutions, which cracks the crystal, when the color fills the cracks throughout the mass. It is also called *Mont Blanc ruby*. Revised by G. F. KUNZ.

**Rubefacients** [from Lat. *rubefaciens*, pres. partic. of *rubefacere*, make red; *rube-re*, be red + *facere*, make]: in medicine, agents capable of producing congestion, and thus redness of the skin, by local contact. Such irritant applications have often the power of relieving congestion, pain, spasm, or undue irritability of deep-seated organs, and are much used for the purpose in therapeutics. Very many drugs have the property of reddening the skin, all blistering agents producing simple hyperæmia as the initial effect of their irritation, but the means most employed strictly as rubefacients are the following: *Heat*, by means of hot baths, cloths wrung out in hot water, bottles of hot water, or heated solids, as earthen platters, bricks, bags of sand, etc.; *mustard*, in the form of prepared mustard-paper moistened, or thick poultices of mustard-meal mixed with cold water; *oil of turpentine*, applied by means of flannels first wrung out in hot water and then in the oil previously warmed; *capsicum* (cayenne pepper), in the form of poultice, or, better, as a lotion mixed with hot spirits; and *ammonia*, in the form of liniment of ammonia (volatile liniment). Plaster of Burgundy pitch and resin cerate are also feebly rubefacient. Revised by H. A. HARE.

**Rubens, PETER PAUL**: painter; b. at Siegen, Westphalia, June 29, 1577. He was of middle-class family, but his parents were persons of influence. He was well educated, and for a time was a page in the household of the Countess of Lalaing at Brussels. His masters in painting were first Tobias Verhaecht, or Vanderhaecht, then Adam Van Noort, and finally Otto Van Veen, or Vaenius, all of Antwerp. At the age of twenty-two he was received as a master painter by the Antwerp guild of painters. In 1600, during the summer, he made the journey to Italy, and seems to have gone first to Venice. Soon after he attached himself to the ducal court of Mantua, then very brilliant and artistic in a certain way. The Duke Vincenzo Gonzaga employed Rubens permanently, and in 1601 sent him to Rome with letters of recommendation to the Cardinal Alessandro Montalto. There he copied pictures and also produced original works, painting pictures at the order of the Archduke Albert VII., who at this time had become sovereign of the Spanish Netherlands. His high character, thorough education, especially in languages, and dignified bearing seem to have given him a peculiar position among artists; he was trusted and treated as a person of high rank by the sovereigns with whom he came in contact as a painter. In 1603 he was sent by the Duke of Mantua on a private mission to Madrid, where he had an exceptional opportunity to study the paintings of Titian. Many pictures of his own are in the Madrid Gallery, and it is thought that several of these were painted during this visit. He was in Mantua from 1604 to 1606, a second time in Rome, and left Italy finally in 1608, after nearly eight years' employment by the Duke of Mantua. Once in Antwerp the Archduke Albert and his wife, Isabella Clara Eugenia, daughter of Philip II. of Spain, forbade his departure; in 1609 he was made their court painter, and in the same year he married. In the next year he painted the *Elevation of the Cross*, now in the cathedral at Antwerp, and in 1611 the *Descent from the Cross*, also in the cathedral, and commonly called the painter's best work. Until 1620 he remained at Antwerp, master of a large studio, with many pupils and assistants, many of whom rose to great distinction. Jakob Jordaens, Franz Snijders, Gaspar de Crayer, Jan Breughel, and even Antony Van Dyck were among his fellow workmen.

In 1620 Rubens undertook a series of pictures for the

Luxembourg Palace at Paris for the Queen Dowager Marie de Médicis. This business called for his presence in Paris on several occasions, but the pictures were painted at Antwerp. They are now at Munich. In 1626 he went to Holland, and in 1628 again to Madrid, on business almost wholly diplomatic in character. In 1629, while still in Madrid, Rubens was appointed secretary of the privy council for the Spanish Netherlands, and was commissioned as envoy to London, where he arrived in May. He left London in Mar., 1630, having previously received knighthood from King Charles I., who also granted him an augmentation of his escutcheon. In Dec., 1630, he married Helena Fourment, niece of his former wife. Her portrait occurs very frequently in his pictures from this time on. The remaining years of his life were filled with artistic work. In 1635 he had to design a most elaborate decoration of the whole city of Antwerp as a welcome to Ferdinand of Austria, son of King Philip III. of Spain, the new governor-general of the Netherlands, appointed on the death of the archduchess. This was a prodigious undertaking, and many vestiges of it yet remain in published and unpublished drawings, and in the pictures which formed part of it. Many large paintings were under way and were left unfinished at his death, which occurred May 30, 1640.

In spite of his active and varied life the amount of work left behind him was enormous, and a great deal of it is preserved. His works are singularly even in quality. They seem to moderns to be lacking in charm, but they are full of vigorous drawing and strong color. They are easy to understand, both in subject and in the more pictorial qualities.

Besides the two great pictures in the Cathedral of Antwerp, named above, it is generally thought that the best places to study this master are the gallery at Antwerp and the old Pinakothek at Munich. Of those at Antwerp, *The Crucifixion between the Two Thieves*, *The Adoration of the Magi*, and *The Virgin with the Body of Christ* are especially important. At Munich there are about fifty canvases, most of them large; there may be named *The Fall of the Rebel Angels*, and another of nearly the same subject, *The Massacre of the Innocents*, *St. Peter and St. Paul*, a picture in which something of the Italian feeling is seen, a remarkable *Silenus with Satyr and Bacchante*, and a number of portraits of the highest interest and value, as *Helena Fourment*, *Lord and Lady Arundel*, the *Archduke Ferdinand*, ruler of the Netherlands, *Philip IV. of Spain*, the *Artist with his First Wife*. In the National Gallery in London are the *Abduction of the Sabine Women*, the *Plague of the Brazen Serpents*, two large *Landscapes*, and a remarkable decorative drawing, *The Birth of Venus*. At the Madrid Gallery, at the Hermitage, St. Petersburg, at the Museums of Berlin, Vienna, Brussels, Darmstadt, and Dresden, at the Louvre, at the Pitti and the Uffizi in Florence, and in such important private collections as Blenheim and the Lichtenstein Palace are pictures impossible to enumerate—perhaps 300 in number in actual public view.

There are many books which treat of Rubens, among them C. Ruellens, *Pierre Paul Rubens, ses Lettres*, etc. (Brussels, 1877); A. Michiels, *Rubens et l'École d'Anvers* (Paris); and Charles W. Kett, in the Great Art Series (1879). A good study of him exists in the *Gazette des Beaux-Arts* (1867-68), and many other notices scattered through the later volumes. RUSSELL STURGIS.

**Ruberythric Acid** [*ruberythric* is from Lat. *rubra*, madder + Gr. *ῥυθρός*, red]: a glucoside,  $C_{28}H_{34}O_{16}$ , found in madder-root by Rochleder. It is crystalline, and forms yellow prisms having a silky luster; has a faint taste; is sparingly soluble in cold, readily in hot water; gives a golden-yellow solution in alcohol and in ether, and a blood-red solution in alkalis. It gives red precipitates with baryta-water, with an alum solution after the addition of ammonia, and with basic acetate of lead after addition of a little alcohol. Schunck did not find this acid in madder, and considers it a product of the decomposition of rubian. Rochleder considers rubian to be impure ruberythric acid. See RUBIAN, ALIZARIN, MADDER, etc. Revised by IRA REMSEN.

**Rubia'cea**: See MADDER FAMILY.

**Rubian** [from Lat. *rubia*, madder]: a glucoside ( $C_{16}H_{16}O_6$ ) discovered in madder-root by Schunck in 1847. It is obtained by treating a hot decoction of madder with bone-black, washing this to remove chlorogenine, extracting it repeatedly with boiling alcohol, and evaporating to dryness. It is then dissolved in water, precipitated with acetate of lead; the lead compound is decomposed by sulphurette:

the end of the ninth century. His full name is given as Farid ad-din Muhammad Rüdagi. Biographical tradition makes him a sort of blind Homer, but as to his blindness there is doubt. His poetical renown won him a position at the court of the Sāmānid Nasar II., ben Ahmad of Khorrāsān. The literary activity of Rüdagi appears to have been great; he is said to have composed more than a million verses. The remains that have been preserved are comparatively meager, but they are of high merit. Among the deplorable losses may be mentioned his translation of the Indian book of fables, *Kalilah and Dimnah*, rendered into Persian from the Arabic version of Abd-allah ibn al Mukaffa. Rüdagi outlived his royal patron, and fallen on evil days he seems to have died about A. D. 954. See Ethé's *Rüdagi der Sāmānidendichter in Göttinger Nachrichten* (1873, pp. 663-742).  
A. V. WILLIAMS JACKSON.

**Rudbeck, OLOF**: scientist; b. at Vesteraas, Sweden, Sept. 30, 1630. He studied natural science at the University of Upsala, where he became a professor in the faculty of medicine. By his discovery, at the age of twenty-three, of the lymphatic canal he gained European renown. In addition to investigations in several branches of science, he devoted himself to the study of archaeology and literature, both classical and Scandinavian, publishing several sagas and Swedish provincial laws (from 1679). His great botanical work, *Campelysis eller Glycisvald*, was left uncompleted. He is best known by his ingenious and learned *Atlant eller Manhem* (4 vols., Upsala, 1675-1702), commonly called *Atlantica*, in which he sought to establish the identity of Sweden with Plato's fabled land and the Garden of Eden. By the fire in Upsala in May, 1702, his library and collections, including the unpublished continuation of *Atlantica*, were destroyed, and his death followed a few months later (Dec. 12).—His son, OLOF RUDBECK (d. 1740), acquired considerable eminence as a zoölogist, and his grandson, also of the same name (d. 1777), was the author of a number of comic poems.

D. K. DODGE.

**Ruddiman, THOMAS**: Latin grammarian; b. at Raggle, Banffshire, Scotland, Oct., 1674; graduated at King's College, Aberdeen; was afterward a publisher and printer to the University of Edinburgh (1728), and principal keeper of the Advocates' Library (1730). He is chiefly known as the author of a once very famous work on *Latin Grammar* (1732), whose learned Latin introduction and appendices are still of value. In 1739 he brought out a magnificent folio edition of Anderson's *Diplomata et Numismata Scotie*, and produced his celebrated "immaculate" edition of Livy (4 vols. 12mo, 1751). D. at Edinburgh, Jan. 19, 1757. See G. Chalmers, *Life of Ruddiman* (1794).

Revised by A. GUDEMAN.

**Rude, rüd, FRANÇOIS**: sculptor; b. at Dijon, France, Jan. 4, 1784. His father was a blacksmith and made stoves, and young Rude was kept at this work, receiving instruction in drawing, during leisure hours only, at an art school in the town. Medals were won for drawing, etc., by the young man, who in 1804 made a bust of the engraver and medalist, Louis Gabriel Monnier. In 1807 he went to Paris, taking with him his statuette of *Theseus picking up a Quoit*. In 1809 he gained a second prize for sculpture at the Imperial Academy, and in 1812 the Grand Prix de Rome, but did not go at once to Italy. At the second restoration Rude went to Belgium with the Frémiet family of Dijon, settled in Brussels, and in 1821 married Sophie Frémiet, who was afterward known as a portrait-painter. In 1827 he returned to Paris, where he was invited to take the atelier for students formerly managed by David d'Angers (see DAVID, PIERRE JEAN). Except for a short visit to Italy, Rude remained faithful to steady and arduous work. He was a man of singular strength of body and simplicity and direct force of character, a republican by conviction, but primarily and all his life long an artist. D. in Paris, Nov. 3, 1855. Of his work there must be named the group of the *Departure for the War*, on the Arc de l'Étoile at Paris, the northern group on the side toward the Champs Élysées, a noble composition, well known to all students; *Mercury fastening his Winged Sandal*, in the Louvre; *Neapolitan Fisher-boy*, also in the Louvre; *Joan of Arc*, in the Luxembourg Garden; and *Hebe and the Eagle of Jupiter and Love the Conqueror*, in the Museum of Dijon. There are also a great many portrait-statues and busts, as *La Pérouse*, the explorer, in the Louvre, *Louis David*, *General Cavaignac*; and what may be called historical portraits, as of men whom he had no chance to study from life, *Napoleon*, at Fixin in Burgundy,

*Marshal Ney*, at Paris, *Marshal Bertrand*, at Chateauroux and as decorations of the new buildings of the Louvre statues of *Houdon*, the sculptor, and *Nicholas Poussin*. There exists a life of Rude, published at Dijon in 1856, and Hamerton wrote an account of him in his *Modern Frenchmen*.  
RUSSELL STURGIS.

**Rüdinger, NICOLAUS, M. D.**: anatomist; b. at Büdesheim, Germany, Mar. 25, 1832; studied medicine at the Universities of Heidelberg and Giessen, where the teachings of Henle, F. Arnold, and T. Bischoff inclined his attention to anatomy; graduated M. D. from the University of Giessen in 1855; immediately thereafter he became prosector and adjunct to Bischoff at the University of Munich, and in 1881 was elected Professor of Anatomy there. He brought the anatomical teaching at that school to a high standpoint utilizing photography to depict his dissections. His most important works are *Atlas des peripherischen Nerven-systems des menschlichen Körpers* (Stuttgart, 1872); *Topographisch-chirurgische Anatomie des Menschen* (Stuttgart 1873-79); *Atlas des menschlichen Gehörorgans* (Munich, 1875). He was coeditor of *Monatsschrift für Ohrenheilkunde* 1867-70, and of the *Beiträge zur Anthropologie und Urgeschichte Bayerns* in 1877.  
S. T. ARMSTRONG.

**Rudolph**: the name of two German emperors. **RUDOLPH I. OF HAPSBURG**, b. in 1218, founder of the house of Austria, and German emperor 1273-91, was the oldest son of Albert IV., Count of Hapsburg and Landgrave of Alsace, which countries he inherited after the death of his father in 1240. He was successful in enlarging his possessions, but it was, nevertheless, not the importance of his political position, but the righteousness and valor of his personal character, which gained for him the German crown. In order to strengthen his authority among his vassals and procure the necessary support, he married his daughters to the two most powerful among them, the count-palatine, Louis, and Duke Albert of Saxony, and then marched against two others who refused to do homage, King Ottocar of Bohemia and Duke Henry of Bavaria. The latter was easily defeated; and Ottocar submitted on the approach of the imperial forces and made peace in 1276. Later, however, he broke the truce, and in the new war was killed in the battle of Marchfeld in 1278. Rudolph gave Bohemia and Moravia to the sons of Ottocar, but Austria, Styria, Carinthia and Carniola he separated from the heritage and gave to his own son, Albert, thus founding the state of Austria. Against his external enemies, the Count of Savoy, the Duke of Burgundy, etc., he was also successful, and his internal government was distinguished by justice and love of order and peace. He traveled from place to place in the empire and sat in court on all important occasions, for which reason his people called him the living law—*lex animata*. D. in 1291, and was buried at Spire. His *Life* has been written by Lichnowski (1836), Schönhuth (1843), and Hirt (1847).—**RUDOLPH II.** (1576-1612), b. July 18, 1552, a son of the Emperor Maximilian II. and Marie, daughter of Charles V. was educated at the Spanish court; crowned King of Hungary in 1572, of Bohemia in 1575, and elected Emperor of Germany after his father's death Oct. 12, 1576. He was superstitious, weak, and entirely in the hands of the Jesuits. Immediately after his accession to the throne the Protestant worship was forbidden throughout his Austrian dominions, the Protestant schools were closed, and the preachers and teachers banished. In the empire he espoused the cause of the Roman Catholic Church with violence, and the formation of the Protestant Union (May 4, 1608) and the Roman Catholic League (July 10, 1609) brought Germany to the verge of civil war. Meanwhile, the Hungarians arose and Bohemia revolted. The house of Austria seemed near its ruin when Matthias, a younger brother of the emperor, took the lead in the affairs of the family, and compelled Rudolph to cede to him all his hereditary possessions. Unable to maintain his authority in the empire, and embittered by his misfortune, the emperor retired into private life, and died at Prague, Jan. 20, 1612. He felt some interest in science and literature, and several great scholars and scientists lived at his court. His *Life* has been written by Gindely (1863-65) and von Beck (1885).  
Revised by F. M. COLBY.

**Rudolstadt**: town of Germany; capital of the principality of Schwarzburg-Rudolstadt; beautifully situated on the Saale, 18 miles S. of Weimar (see map of German Empire, ref. 5-E). It has a fine palace with a picture-gallery and a library, and manufactures of woollens, porcelain and dyestuffs. Pop. (1890) 11,398.

hyperboloid of revolution is generated by a line revolving round an axis which it does not intersect. Ruled surfaces of the second order, such as those mentioned, can be generated by the movement of a line in two distinct ways; and each line of one system intersects all the lines of the other system. This is not the case with other ruled surfaces. The surface is called a developable, that is, capable of being opened out into a plane, if two consecutive generating lines intersect. If the intersection is a fixed point, the surface is a cone, and if the lines are parallel the surface is a cylinder. See CONE and HYPERBOLOID. R. A. ROBERTS.

**Rule Nisi:** in law, a rule or order obtained on an *ex parte* motion, which, after due service upon the party against whom the rule is obtained, will be made absolute, unless (*nisi*) the party appears and shows good cause why it should not be made absolute. F. S. A.

**Rule of the Road:** See ROAD, LAW OF THE.

**Ruling-machines:** instruments designed for the subdivision of a given unit of length into any required number of parts, either equal or unequal. These are called "line-dividing engines" or "circular-dividing engines," according as the unit to be subdivided is a rectilineal measure or a circular arc.

The circular-dividing engine consists of a disk capable of accurate movement about a true center and of suitable mechanism for making this movement automatic. A graduating attachment produces automatically the marks upon the metal surface which correspond to the movement in revolution. There are, in general, two types of mechanism by which the movement in revolution is effected. According to the first type, the disk is moved by means of a gear and a worm cut in the periphery of the disk. In this type, the accuracy of the subdivision depends entirely upon the accurate workmanship of the worm and gear. Since the action is automatic there is no chance for the correction of known errors during the operation of graduation. In the second type the subdivision is effected by means of an arm attached to the disk, by which it is carried a definite distance, determined by the position of two metal stops, one of which is fixed, while the other is adjustable by means of a stout micrometer screw. The arm is connected with the revolving disk by means of electro-magnets. These clamp the arm to the disk during the forward motion and are released during the backward motion.

In the operation of the engine it is assumed that the master circle has been graduated without sensible error by suc-

cle can be exactly copied, and still further subdivision can be effected by setting the stops at the distance apart required to produce aliquot subdivisions. Suppose, for example, that

FIG. 2.—The Rogers dividing-engine, front view.

it is required to graduate a circle to ten minutes of arc. First the stops are set to correspond to this distance approximately. It is not to be expected that this can be done with the utmost exactness, but when the machine is started in operation the microscope under which the lines of the master circle are viewed, having a high magnifying power, will easily detect any deviation as small as one-tenth of a second of an arc. As soon as the slightest deviation is detected it can be corrected by the motion of the adjustable stop, since ten divisions of the micrometer screw by which this movement is effected are equivalent to this distance. Thus an accumulation of errors can be prevented while the engine is in operation, and before any sensible error has been introduced.

**The Line-dividing Engine.**—The movement by which the subdivision of a given unit may be effected, as shown in Figs. 2 and 3, is usually produced by a screw of superior construction. A perfect screw, however, can give good results only when it is properly connected with the ruling carriage. If the screw has considerable length and a relatively small diameter the flexure must be taken into account. All kinds of constrained motion must be avoided, since under changes of temperature the effect of this constrained action will be variable. Usually the carriage to which motion is given by the nut moves over V-shaped ways. Since, in the construction of ways of this form, it is, to say the least, exceedingly difficult to maintain plane surfaces upon both surfaces of the ways and at the same time to maintain them straight and parallel, this form of construction is to be avoided in a dividing-engine in which great precision is desired. The form of ways shown in Fig. 3 is to be preferred. In this form each way is perfected independently by measurement tests made during the process of construction. It has been found to be not at all difficult to reduce the departure from a true plane to a limit corresponding to a radius of curvature as great as 500 miles for a distance of 40 inches.

The carriage moved by the nut and the screw is kept in contact with the face of the vertical wall by means of cylindrical plugs backed by springs acting against the opposite wall. In Fig. 3 the plate shown at 2 is pressed against the left wall at 1, and the spring plugs act against the right wall.

In the construction of a screw for a dividing-engine four difficulties must be overcome if great precision is desired. (1) Every half of every revolution of the screw must at every point be equal to every other half. Errors which depend upon a single revolution of the screw are called periodic errors of single revolution. The writer has had good success in the elimination of errors of this class by grinding the

FIG. 1.—Screw-cutting machine.

cessive approximations; at least to single degrees. When the stops are set at the proper distance apart the master cir-

instrumental in founding the Royal Institution in London in that year; settled at Paris and published his *Philosophical Papers* (vol. iv. of his *Essays*, 1802); married the widow of Lavoisier 1804, and spent the remainder of his life in quiet prosecution of his scientific studies at his wife's villa at Auteuil, near Paris, where he died Aug. 21, 1814. He contributed to science a considerable number of valuable observations and discoveries, especially upon his favorite subject, that of heat, of which he came near discovering the mechanical equivalent; made a series of experiments which directly led at a later period to the discovery of the correlation of forces; was also one of the pioneers of modern researches in optics and magnetism; left prizes to be awarded by the Royal Society of London and the American Academy of Sciences at Boston for discoveries on light and heat, and was himself the recipient of the first Rumford prize from the Royal Society; and endowed in Harvard College the Rumford professorship of the physical and mathematical sciences as applied to the useful arts. See his *Life*, by Rev. Dr. George E. Ellis (1871), and his *Works*, edited by the same gentleman (4 vols., London, 1876).

**Rūmī**, roo-mē', JALĀL AD-DĪN: Persian Sūfi poet and philosophic teacher; b. at Balkh, A. D. 1207. He was descended of high ancestry and his father, Bahā ad-dīn Valad was so famous for his learning and the influence of his teaching as to excite the enmity of the jealous sultan, and to be obliged in consequence to leave Balkh with his family. After various travels he found his way to Asia Minor and settled at Iconium, where he founded a college under the patronage of the Sultan of Rūm, as Asia Minor is termed in the Orient. Hence the appellation Rūmī, by which his more distinguished son is known. Jalāl ad-dīn was an enthusiastic student, and his thirst for spiritual knowledge was fostered under his father's teaching. His father died in 1231, and Jalāl continued under scholarly guidance zealously to pursue his studies, and he succeeded ultimately to his father's chair and to the superintendence of the colleges of Iconium. Sorrow, which came to him in the untimely death of his son and in the sad fate of a beloved teacher, seems to have deepened his religious devotion, to have given tone to his mystic philosophy, and at the same time to have enriched his poetic talents. He became the founder of the Maulavi sect of dervishes, and his zealous devotion to this order seems to have been a source of inspiration for his spiritual and mystic odes. His great work is the *Masnawī*, or *Mathnawī*, a production of high poetic merit, religious fervor, and philosophic thought. It is a huge collection of precepts and tales, and it comprises between 30,000 and 40,000 rhymed couplets. Jalāl ad-dīn Rūmī died in 1273, shortly after the completion of this monument, by which his name is known to fame. His teachings and doctrines continued to be cherished by the Maulavi sect that he had founded, and the leadership of this dervish order has traditionally remained in the direct line of his descendants. There is a versified translation of the first book of the *Masnawī*, by J. W. Redhouse (London, 1881, Trübner's Oriental Series), a volume which should be consulted for fuller particulars. Selected portions have been rendered into German by Rosenzweig (Vienna, 1838). For other details, see Sir Gore Ouseley, *Biographical Notices of Persian Poets*, pp. 112-116 (London, 1846); H. Ethé, in *Morgenländische Studien*, p. 95, seq. (Leipzig, 1870); S. Robinson, *Persian Poetry for English Readers*, pp. 367-381 (Glasgow, 1883).

A. V. WILLIAMS JACKSON.

**Rumohr**, roo'mör, THEODOR WILHELM: novelist; b. in Copenhagen, Denmark, Aug. 2, 1807. His romances, of which he wrote a great number, treat for the most part of popular national heroes, such as Niels Juel and Tordenskjold. His collected works, *Fædrelands historiske Malerier* (14 vols.), were published at Copenhagen, 1850-65. D. K. D.

**Rump Parliament**: the popular name applied in English history to a remnant of the Long Parliament. It consisted of sixty members, who, after the expulsion of three-fourths of that body, Dec. 6, 1648 (known as Pride's Purge), were allowed by Cromwell to carry on the farce of legislation, and co-operated with him and with the army in effecting the trial and condemnation of Charles I. The Rump, having attempted to resist certain encroachments of the army, was dissolved by Cromwell Apr. 20, 1653; was restored by a military movement during the protectorate of Richard Cromwell; was a second time expelled by the army Oct. 13, 1659; reassembled on the advance of Gen. Monk from Scotland 1660, and decreed its own dissolution Mar. 16, 1660.

**Rumsey, JAMES**: inventor; b. at Bohemia Manor, Cecil co., Md., about 1743; became a machinist; made several improvements in the mechanism of mills; in Sept., 1784, exhibited on the Potomac river, in the presence of Gen. Washington, a boat which ascended the stream by mechanical appliances; in 1785 was granted by the Assembly of Pennsylvania exclusive right for ten years "to navigate and build boats calculated to work with greater ease and rapidity against rapid rivers." A year later he introduced a steam-engine of his own construction into his boat on the Potomac; obtained a patent for steam-navigation from the State of Virginia 1787; published at Philadelphia his *Short Treatise on the Application of Steam* (1788), which involved him in a controversy with John Fitch; organized at Philadelphia a Rumsey Society for the promotion of steam-navigation 1788; went to England soon afterward; organized there a similar society; built a new steamboat; obtained patents in England, France, and Holland, and made a successful trip on the Thames in Dec., 1792. D. suddenly in London, Dec. 23, 1792.

**Runcorn**: town; in Cheshire, England; on the estuary of the Mersey; 12 miles E. S. E. of Liverpool (see map of England, ref. 7-F). The Mersey is crossed here by a railway viaduct 1,500 feet long and 95 feet above high water. There is a large traffic by the Bridgewater Canal, which enters the river at Runcorn by a succession of locks. The industries include ship-building, rope-making, quarrying, etc. Pop. (1891) 20,050.

**Runeberg**, roo'ne-bärch, JOHAN LUDVIG: poet; b. at Jakobsstad, Finland, Feb. 5, 1804; studied at the University of Åbo from 1822 to 1827. In 1830 he became lector of aesthetics at the University of Helsingfors, and published his first collection of poems, but removed in 1837 to Borgå, and in 1842 became Professor of Greek Literature at that gymnasium. Although he was born in Finland and spent his whole life in that country, he wrote in Swedish; and although he was liberally supported by the Russian Government, he sang the valor and perseverance of his countrymen in resisting the invading and conquering Russians. The immense popularity which his poems acquired both in Finland and Sweden was principally due to his talent. His genius was lyric-epic, and his lyrical faculty was delicately harmonious. His numerous minor poems evince a strong sense of reality. His idylls, *Hanna* (1836) and *Julvällen* (Christmas Eve, 1841), and his tales in verse, *Elgskyttarne* (The Elk-hunters, 1832), and *Nadeschda* (1841), are true epics, with a lyrical swing in the outlines. His dramas, of which *Kungarne på Salamis* (1863), a tragedy in antique form, is the most remarkable, contain real characterization. The most celebrated of his works is *Fänrik Ståls Sägner* (Ensign Staal's Tales, i., 1848; ii., 1860), a collection of ballads treating subjects taken from the war between Sweden and Russia, when Finland was conquered by the latter. D. at Borgå, May 6, 1877.

Revised by D. K. DODGE.

**Runes** [O. Eng. *rūn*, rune, secret, mystery; Icel. *rūn*: O. H. Germ. *rūna*: Goth. *rūna*, secret, mystery; cf. Gr. *ῥεύω*, track out, deriv. of *ῥέω*, search]: the earliest graphic system used among the Germanic tribes. The name rune, first mentioned by Venantius Fortunatus (sixth century A. D.), and most probably older than the letters themselves, may in its first meaning have been applied to the *notæ* of Tacitus (*German.*, c. 10), which were cut on staves and used for divination by the priests for sorcery and as charms. Whether the runes were already known at the time of Tacitus is very doubtful, though the Germans were not ignorant of writing; the *litterarum secreta* (*German.*, c. 19) refers to secret correspondence. The investigations of Kirchhoff and Wimmer are the only ones that satisfactorily account for the origin of the runes; the Latin alphabet of the early empire is the source of the twenty-four runes of the oldest alphabet. The question as to the date of its introduction is more difficult to settle. The fact that Ulfilas (died 381 A. D.) chose two runic characters in devising his Gothic alphabet justifies us in fixing the date with certainty as early as the close of the second century. That this alphabet was common to all Germanic peoples is proven by the corresponding names of the letters and by the inscriptions on three monuments: the Swedish *bracteæ* of Västerna, with twenty-three signs; the clasp found at Charnay, in Burgundy, with twenty runes; and the short sword found in the Thames, containing twenty-eight characters. The first two are the older, and date probably from the seventh century. The latter inscription (about 800 A. D.) slightly deviates from the original order, and shows

on the shores of Lake Ladoga, he and his brothers Sineus and Truvor crossed the Baltic and subjugated this region. He soon extended his dominion to the east and south, and in 862 he established himself in Novgorod and ruled the country as absolute monarch until his death, which occurred about 880. His descendants ruled Russia for more than 700 years until 1598, and Russian princes still trace their pedigrees to Rurik. See RUSSIA; also C. C. Rafn, *Antiquités Russes*.

RASMUS B. ANDERSON.

**Rush** [M. Eng. *rusche*, *rische* < O. Eng. *risce*. Cf. Lat. *ruscum*, butcher's broom, whence probably the O. Eng. form]; any plant of a family (*Juncaceæ*) of monocotyledonous herbs, of which the genus *Juncus* is the type; also any one of various plants belonging to the *Cyperaceæ* (mostly species of *Scirpus*), with naked, tough, and flexible stems. There are many species, mostly in wet and cold regions. They are employed in making chair-bottoms, mats, etc. Rushes are used in Europe for strewing the floors of cottages instead of carpets. The pith of some kinds is used sometimes for a candle-wick; hence the name rushlight. Most of the numerous species found in the U. S. are also European and Asiatic. *Juncus bulbosus* is the black grass of the salt-marshes, and makes excellent hay. *Scirpus lacustris* is called bulrush in the East, and tule in California, where it covers vast areas of wet land.

Revised by CHARLES E. BESSEY.

**Rush, BENJAMIN, M. D., LL. D.**: signer of the Declaration of Independence; b. at Byberry, near Philadelphia, Pa., Jan. 4, 1746; graduated at Princeton 1760; studied medicine at Philadelphia, Edinburgh, London, and Paris; began practice at Philadelphia Aug., 1769, being at the same time chosen Professor of Chemistry in the medical college of that city; was a member of the provincial conference of Pennsylvania 1776, in which he moved the resolution to consider the expediency of a declaration of independence; was chosen to the Continental Congress to fill a vacancy in June, and was one of the signers of the Declaration of July 4, 1776. He was surgeon to the Pennsylvania navy 1775-76, was appointed in Apr., 1777, surgeon-general, and in July physician-general, of the military hospitals for the middle department; resigned that post Feb., 1778, and resumed his duties as professor and practitioner in Philadelphia; established in 1785 the first dispensary in the U. S.; was a member of the Pennsylvania convention of 1787 for the ratification of the Federal Constitution; published four letters to the people of Pennsylvania pointing out the defects of the Constitution of 1776; sat in the convention which formed the constitution of 1780; exchanged his professorship for that of the theory and practice of medicine on the death of Dr. John Morgan, Oct., 1789; rendered eminent services to humanity during the yellow-fever epidemic of 1793, which were subsequently recognized by testimonials from the King of Prussia (1805), the Queen of Etruria (1807), and the Emperor of Russia (1811); was one of the founders of Dickinson College, vice-president of the Philadelphia Bible Society and of the American Philosophical Society, president of the Philadelphia Medical Society and of the Society for the Abolition of Slavery, and was treasurer of the U. S. mint from 1799 until his death, in Philadelphia, Apr. 19, 1813. From his nineteenth year he was a frequent writer upon professional, scientific, political, religious, social, and ethical topics. Selections from his productions were republished under the title *Medical Inquiries and Observations* (5 vols., 1789-98; 2d ed., 4 vols., 1804; 3d ed., 4 vols., 1809), and the best of his miscellaneous works were collected by himself into three vols., *Medical Inquiries and Observations upon the Diseases of the Mind* (1812; 5th ed. 1835); *Sixteen Introductory Lectures to Courses of Medicine* (1811); and *Essays, Literary, Moral, and Philosophical* (1798; 2d ed. 1806). He had published an early volume of *Medical Tracts*, and left unfinished a treatise on *The Medicine of the Bible*.

**Rush, RICHARD**: statesman; son of Dr. Benjamin Rush; b. in Philadelphia, Pa., Aug. 29, 1780; graduated at Princeton 1797; was admitted to the Philadelphia bar 1800; became attorney-general of Pennsylvania Jan., 1811; comptroller of the State treasury Nov., 1811; was Attorney-General of the U. S., Feb. 10, 1814-Dec. 15, 1817, having temporarily acted as Secretary of State in the latter year; was minister to England 1817-25; negotiated treaties respecting the fisheries (1818), the northeastern boundary, the Oregon question, and the slaves carried from the U. S. in British vessels after the Treaty of Ghent; was Secretary of the Treasury under President J. Q. Adams 1825-29; was a

candidate for the vice-presidency on the ticket with Adams 1828; negotiated in Holland a loan for the corporations of the District of Columbia 1829; was a commissioner to adjust the boundary between Ohio and Michigan 1835; went to Great Britain in 1836 as commissioner to lay claim to the chancery court to the Smithsonian legacy (see SMITHSON, JAMES); returned with the money Aug., 1838; was minister in France 1847-51, after which he spent his closing years in retirement at Sydenham, near Philadelphia, where he died July 30, 1859. He wrote much in periodicals in support of the war of 1812, against the U. S. Bank, and on other subjects; superintended the publication of an edition of the laws of the U. S. (5 vols., Philadelphia, 1815); edited a pamphlet, *Washington in Domestic Life, from Original Letters and Manuscripts* (1857), and published two volumes of reminiscences of court life in London. His sons published in 1860 his *Occasional Productions, Political, Diplomatic, and Miscellaneous*.

**Rushville**: town; capital of Schuyler co., Ill.; on the Chi., Burl. and Quincy Railroad; 11 miles N. W. of Beardstown, 50 miles E. N. E. of Quincy (for location, see map of Illinois, ref. 6-C). It is in a coal-mining, grain, and fruit-growing region, and contains a number of manufactories, a State bank with capital of \$25,000, a private bank, a public library, and a tri-weekly, a monthly, and two weekly periodicals. Pop. (1880) 1,662; (1890) 2,031.

**Rushville**: city; capital of Rush co., Ind.; on Flat Rock creek, and the Cin., Ham. and Dayton, the Cleve., Cin., Chi. and St. L., the Ft. Wayne, Cin. and Louisv. and the Pitts., Cin., Chi. and St. L. railways; 39 miles E. S. E. of Indianapolis, 84 miles N. W. of Cincinnati (for location, see map of Indiana, ref. 7-F). It is in an agricultural region; has manufactories of flour, lumber, furniture, bent wood, washing-machines, clay-working machinery, drain-pipe, shirts and trousers, extension-tables, and other articles; and contains electric-light and natural-gas plants, 8 churches, 2 national banks with combined capital of \$200,000, a private bank, and a semi-weekly and 2 weekly newspapers. Pop. (1880) 2,515; (1890) 3,475; (1894) estimated, 4,000.

EDITOR OF "REPUBLICAN."

**Rushworth, JOHN**: historical writer; b. in Northumberland, England, about 1607; educated at Oxford; studied law at Lincoln's Inn; began in 1630 to take notes of proceedings in the higher courts and in Parliament; was assistant clerk to the Long Parliament; became secretary to Lord Fairfax; took an active part in negotiations during the civil war; was for many years a member of Parliament, and afterward secretary to Lord Keeper Bridgman, but becoming involved in debt spent his last years (from 1644) in the King's Bench prison, London, where he died May 12, 1690. In 1659 he began the publication of *Historical Collections of Private Passages of State, Weighty Matters of Law, and Remarkable Proceedings in Five Parliaments* (from 1618 to 1648); issued vols. ii. and iii. in 1680, and in the same year his *Tryall of Thomas, Earl of Strafford*. He left in MS. the materials for vols. iv. and v., which were issued in 1692, and for vols. vi. and vii., completing the work, which appeared in 1701. A new and better edition of the whole, together with the *Tryall*, was reprinted in 1721 (2 vols. folio).

**Rusk**: town; capital of Cherokee co., Tex.; on the St. Louis S. W. Railway; 16 miles S. E. of Jacksonville (for location, see map of Texas, ref. 3-J). It is in an agricultural and iron-mining region; contains a branch of the State penitentiary, the convicts of which are chiefly employed in developing the iron interests of the vicinity; has an iron furnace at the penitentiary and another between Rusk and New Birmingham, and a national bank with capital of \$50,000, a private bank, and two weekly newspapers. Pop. (1880) 626; (1890) 1,383.

**Rusk, JEREMIAH MCLEIN**: agriculturist; b. in Morgantown, O., June 17, 1830; brought up on a farm; at fifteen became a driver of a stage-coach between Zanesville and Newark; removed to Wisconsin 1853, where he managed a farm and drove a stage; elected sheriff 1855; member of Wisconsin Legislature 1861; enlisted in Twenty-fifth Wisconsin Volunteer Infantry 1862; served to the close of the war, obtaining the rank of brigadier-general; elected State bank comptroller of Wisconsin 1865; re-elected 1867; elected to the Forty-second Congress by the Republicans 1870; re-elected to the Forty-third and Forty-fourth Congresses; elected Governor of Wisconsin 1881; twice re-elected. The

University of Oxford, where he created a church before the foundation of Peterhouse (1284), in whose choir and choir school of choristers of the cathedral was founded. (Oxford, Oxford University, Vol. 2, 1909, p. 111.)

work on oil-painting, and one which had a large circulation on pastel, under the title *Elements of Painting with Crayons*. He was greatly interested in astronomy, and drew and engraved a lunar map and also an elaborate machine called the selenographia, for showing the moon's phases. D. Apr. 20, 1806. In the National Portrait Gallery, London, are portraits in oil-color of *William Wilberforce* when a child, and the *Rev. Dr. Dodd*; also a pastel portrait of *Richard Brinsley Sheridan*, the dramatist and orator. At the Royal Academy permanent exhibition is Russell's diploma picture, *Ruth and Naomi*, in pastel. At the South Kensington Museum are several pastel drawings. In the Louvre is a pastel painted in 1781, *A Child holding Cherries*. The greater number of the pictures known to exist are in private collections. A valuable monograph on the artist and his work, with many illustrations, has been published by George C. Williamson (London, 1894).

RUSSELL STURGIS.

**Russell, JOHN RUSSELL**, Earl: statesman; third son of the sixth Duke of Bedford; b. in London, England, Aug. 18, 1792; educated at Westminster School and at the University of Edinburgh; traveled in Spain and Portugal during the Peninsular war 1809-10; entered Parliament as a Whig 1813, representing the family borough of Tavistock; displayed great zeal in his opposition to the Tory ministry and in advocacy of Roman Catholic emancipation and parliamentary reform; became intimate with the literary men of the time; published the *Life of his ancestor, William, Lord Russell* (1819), *An Essay on the History of the English Government and Constitution* (1821), *Memoirs of the Affairs of Europe from the Peace of Utrecht* (2 vols., 1824-29), and several other works; was the parliamentary leader of the great movement which effected in 1828 the repeal of the Test and Corporation Acts, in 1829 the emancipation of the Roman Catholics, and in 1832 laid the foundation of the modern era of English history by the long-delayed victory of the Reform Bill. In 1830-34 Lord John Russell was paymaster of the forces in the Grey administration; was Secretary of State for the Home Department 1835-39, and afterward for War and the Colonies (1839-41) in the second Melbourne ministry, of which he was the leader in the House of Commons. He carried several important measures of reform in regard to ecclesiastical and municipal affairs, education, marriage, and civil and criminal law; was returned to Parliament in the election of 1841 for the City of London, which he continued to represent for many years; was the leader of the opposition to the Peel ministry 1841-45; declared in favor of the immediate repeal of the Corn-laws Nov., 1845, upon which basis he was invited to form a ministry Dec., 1845, but failed through the dissensions of Earl Grey and Lord Palmerston, and had to yield to Sir Robert Peel the honor of procuring the enactment of the repeal. Upon the dissolution of the old Tory party in 1846, Lord John Russell became Prime Minister and First Lord of the Treasury, and conducted the affairs of state through the difficult period embracing the Irish famine, the Chartist agitations, and the continental revolutions of 1848-49. His ministry was overthrown in Feb., 1852, but the Earl of Derby having been unsuccessful in his attempt to carry on the government, the Aberdeen cabinet was formed Dec., 1852, in which Lord John Russell accepted the position of Secretary of Foreign Affairs. He introduced a new Reform Bill 1854; became Colonial Secretary in the first Palmerston ministry Feb., 1855, and soon afterward went as commissioner to the Vienna Conference, intending to put an end to the Crimean war, but lost public favor by his support of the Austrian programme, and retired from the cabinet July 16. In June, 1859, he returned to office as Secretary of Foreign Affairs in the second Palmerston ministry; was elevated to the peerage as Earl Russell of Kingston-Russell July, 1861; favored the cause of Italian unity and independence, and protested against the annexation of Nice and Savoy by France; incurred severe criticism by his course toward the U. S. during the civil war, especially in the Trent and Alabama affairs, as also by his fruitless manifestations of sympathy for Poland and Denmark in their struggles with Russia and Germany. On the death of Lord Palmerston, Earl Russell again became Prime Minister, Oct., 1865, Mr. Gladstone being, however, the real leader of the cabinet, which resigned in June, 1866. After that period he accepted no office, but took an active part in the debates of the House of Lords and devoted himself anew to literature. He edited the *Correspondence of John, Fourth Duke of Bedford* (3 vols., 1842-46), the *Memorials and Correspondence of C. J.*

*Fox* (4 vols., 1853-57), the *Memoirs, Journal, and Correspondence of Thomas Moore* (1852-56) and selections from his own *Speeches and Dispatches* (1870); and wrote the *Litt. and Times of C. J. Fox* (1859-66), *The Rise and Progress of the Christian Religion in the West of Europe* (1873), and an autobiographical work, *Recollections and Suggestions, 1815-73* (1875). D. at Richmond Park, Surrey, May 28, 1878.

Revised by F. M. COLBY.

**Russell, JOHN SCOTT, F. R. S.**: naval engineer; b. in the Vale of Clyde, Scotland, in 1808; studied at the Universities of Edinburgh, St. Andrews, and Glasgow, graduating at the latter 1824; devoted himself to applied mechanics, engineering, and natural philosophy; delivered a course of lectures on the last subject in the University of Edinburgh in 1832; engaged at Edinburgh in the construction of small steam-boats for canal and river navigation, and of steam-carriages which ran upon the common roads between Paisley and Glasgow; introduced the wave system into the construction of ocean steamships 1835; established himself in London 1844 as a builder of the largest class of steamships, and built the Great Eastern, which was designed by Brunel upon his system; read in 1857 to the British Association a paper upon *The Mechanical Structure of the Great Ship*; was one of the founders of the Institution of Naval Architects, of which he was vice-president, and contributed largely to its *Transactions*. He published an elaborate and costly illustrated work, *The Modern System of Naval Architecture for Commerce and War* (1864) and of *Systematic and Technical Education for the English People* (1869). He was well known as a philanthropist. D. in the Isle of Wight, June 8, 1882.

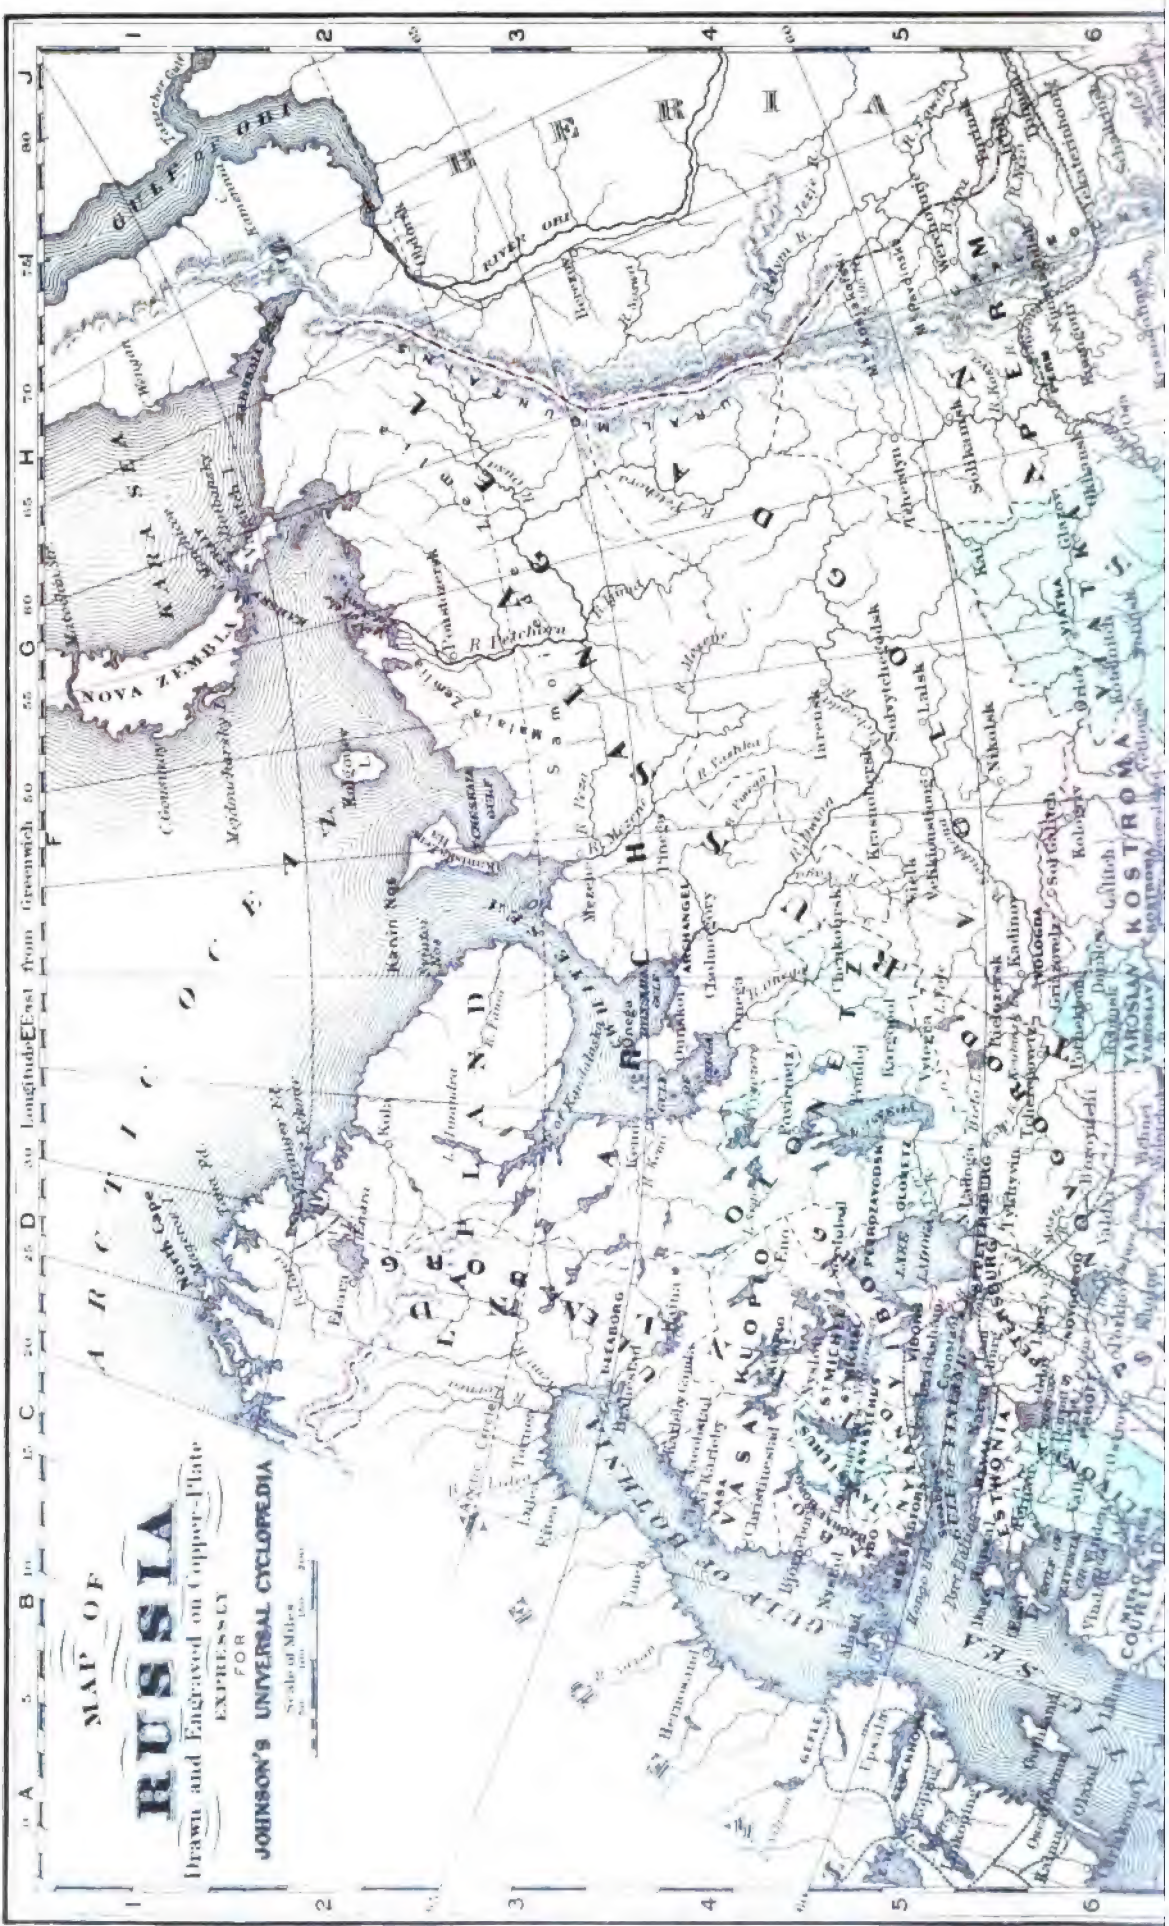

**Russell, JONATHAN, LL. D.**: statesman; b. at Providence, R. I., in 1771; graduated at Brown University 1791; studied law, but exchanged its practice for commercial pursuits; was an accomplished and effective writer and an active politician; was U. S. minister to Sweden 1814-18; signed the Treaty of Ghent 1814 as one of the five American commissioners, and was member of Congress 1821-23. D. at Milton, Mass., Feb. 19, 1832.

**Russell, WILLIAM, Lord**: statesman; son of the fifth Earl of Bedford; b. in England, Sept. 29, 1639; educated at Cambridge; entered Parliament 1660; married Lady Rachel, daughter of Thomas Wriothesley, Earl of Southampton, and widow of Lord Francis Vaughan, 1669; first became prominent in 1673 as one of the leaders of the Protestant or "country party," which carried on a vigorous opposition to the unscrupulous measures of the court; proposed in Nov., 1678, the removal of the Duke of York from the royal councils, and on June 16, 1680, appeared before the king's bench in Westminster to present that prince as a recusant, and headed the deputation of 200 members of the House of Commons which carried up to the House of Lords the bill for the exclusion of James as a papist from the succession. When a reaction had set in against the Protestant alarmists, the court determined to be revenged upon Russell, Sidney, and other prominent Whigs, who were accordingly accused by suborned witnesses of participation in the Rye House plot. Arraigned for treason at the Old Bailey, July 13, 1683, Russell was refused counsel, but his wife was permitted to act as his secretary during the trial. Condemned to death and attainted July 14, he was beheaded in Lincoln's Inn Fields July 21, 1683. The trial was in violation of the forms of law, and no evidence was given to prove him guilty of the specific offense charged—i. e. conspiring against the life of the king. His attainder was reversed after the revolution of 1688, and in 1694 his father was made Duke of Bedford, to which title Lord William's son, Wriothesley, succeeded. Lady Russell, born 1636, survived her husband forty years, and died at Southampton House, Sept. 29, 1723. Her *Letters* to her husband were published 1773, became widely popular, and have been often reprinted. See *Life of Lord Russell*, by Lord John Russell, 1819.

**Russell, WILLIAM CLARK**: novelist; b. of English parents, in New York, Feb. 24, 1844. He spent much of his early life at sea, and afterward resided near Ramsgate, England, and became a contributor, mainly on nautical topics, to London journals. He has published a large number of sea stories and novels, including *The Wreck of the Grovenor* (1878); *A Sailor's Sweetheart* (1880); *My Watch Below* (1883); *A S. S. Queen* (1883); *Round the Galley Fire* (1883); *Jack's Cruise* (1884); *The Frozen Pirate* (1887); *The Death Ship* (1888); *Marooned* (1889); *The Romance of Jenny Harlow* (1889); and *The Good Ship Mohock* (1895). H. A. BEERS.

ter of Agriculture, the production was, in bushels, wheat, 272,000,000; rye, 792,000,000; oats, 672,000,000; and barley, 178,000,000.

The ownership of the 1,098,507,780 acres of land (exclusive of Arctic islands and of 40,925,060 acres forming the pasture-grounds of the Kalmucks and Kirghiz) comprising European Russia proper was in 1892 distributed as follows: The state, 410,801,867; the imperial family, 19,890,835; the peasants, 373,310,496; private owners, 204,504,582. The area unfit for cultivation, in roads, etc., was 210,058,770 acres (19.1 per cent.). The amount of arable land was 287,969,552 acres (26.2 per cent.), orchards, meadows, grazing, etc., 174,958,734 (15.9 per cent.), forest, etc., 425,520,714 (38.8 per cent.).

The raising of stock constitutes a very important branch of farming, sometimes intimately related to agriculture and sometimes an independent and exclusive occupation of the peasant. In the northwestern governments, in the Baltic provinces, and in Finland, the most important branch is the dairy and the fattening of cattle for slaughter. In the southeastern districts and in Bessarabia work cattle and horses are of great importance, but sheep-breeding for wool is also a profitable industry. In Northeastern Russia the breeding of horses for work purposes heads the other departments of stock-raising, but milch cows are also largely raised for the production of high-grade butter and cheese. In the central region the fertility of the soil precludes profitable herding on a large scale, but the breeding of milch cows, the fattening of fine heaves and hogs, and the raising of good trotters and of large draft horses are much developed. In the southern and southeastern steppe districts, and also in the region of the Don, herding is of great importance, owing to the great amount of pasture land, but the most extensive branch there is that of herding fine-wool merino sheep, exclusively confined to rich estates, the peasants raising as a rule only horned cattle. Horse-breeding is also centralized in this region. In 1888 European Russia, including Finland, but not Poland, had 21,156,000 horses, 29,190,000 cattle, 49,252,000 sheep, 10,928,000 swine, 26,000 camels, 1,409,000 goats, and 385,000 stags. The wide range of stock-raising in Russia is indicative of the vastness of the country and the extremes of its climate. Thus while reindeer are largely kept in the north, camels are extensively herded in Caucasasia and Turkestan. Of wild animals the ermine, sable, marten, bear, etc., are found in the north (Poland and Lithuania), the wolf, deer, and fox everywhere, and the average annual value of the export of furs is almost \$3,000,000.

**Forests.**—Of the total area of Russia about one-third is forest. The decrease since the nineteenth century began has been about 23 per cent. An important measure was taken by the Government in 1888 for the protection of forests, most of which have been placed under a special committee appointed in each province. The total area of forest in European Russia, Poland, Finland, and Caucasasia is 498,177,000 acres. In this forest region of the north there are immense districts in which the only roads are the rivers flowing between interminable walls of trees. The predominating species in this region are the conifers, the pine, and the fir, while in the lesser forests of the south the oak is most commonly to be seen, plentifully interspersed in the east with the linden and in the extreme west and the Crimea with the beech.

**Mining and Metallurgy.**—The mineral resources are exceedingly great, and the mining industry is carried on with advanced scientific system and very successfully. Prior to the time of Peter the Great only the most primitive beginnings of a metallurgical and salt industry existed, but that monarch gave origin and impetus to the development of the present extensive system, establishing in 1700 the first separate official mining administration, known as the Prikase of Mining Affairs. He founded the mining-college in 1719, and in every way unceasingly fostered the industry. From that time to the reign of Alexander II. the metal interests of the empire underwent various vicissitudes of rise and decadence, and were finally revolutionized by the liberation of the serfs and the consequent modifications of economic conditions. The direction of mining affairs in the empire (exclusive of Finland) is now mainly concentrated in the mining department of the University of State Domains, and this administration directs not only the raising of ores, but also their mechanical, metallurgical, and chemical treatment. The vast salt and petroleum producing industries are excepted from the direction of this department. In the most important branches of mining the figures of produc-

tion and value were for the year 1890 (and in some cases 1892) as follows:

| PRODUCTS           | Pounds. | Tons.       | Value.       |
|--------------------|---------|-------------|--------------|
| Gold.....          | 77,580  | .....       | \$25,902,175 |
| Silver.....        | 36,396  | .....       | 605,550      |
| Platinum.....      | 6,228   | .....       | 519,000      |
| Copper.....        | .....   | * 4,109     | 2,480,500    |
| Lead.....          | .....   | 825         | 38,250       |
| Zinc.....          | .....   | * 5,059     | 416,750      |
| Mercury.....       | 733,824 | .....       | 474,000      |

| Sulphur.....       | .....   | 352,800     | 4,125        |
| Total value.....   | .....   | .....       | \$66,763,175 |

\* Amount for 1892.

The number of men employed in mining industries in 1890 was 435,700, showing an increase in twenty years of almost 100 per cent. The coal-mining industry on the Don has grown rapidly, and the district, which produces about one-half the total output of the empire, increased its output more than 100 per cent. from 1884 to 1892. Besides the output of the Don—viz., 3,507,000 tons in the latter year—Poland produced 2,837,300, the Ural region 230,000, Moscow 176,800, and Altai 19,200 tons. The Caspian naphtha (petroleum) industry has also extended rapidly, the output of crude naphtha more than doubling from 1887 to 1892, with a correspondingly great advance in refining.

**Manufacturing.**—It is only in very recent years that Russia has exhibited strength as a manufacturing nation at all commensurate with her importance in other respects. The patriarchal state of domestic economy under which each family was its own producer and consumer longer held sway here than in most other countries of Europe, and in many places the breaking away was not noticeable until about the middle of the nineteenth century. But the vast and vigorous growth of manufacture began in the decade following the emancipation of the serfs (1861), expanding in the succeeding one in which railway-building was begun on a colossal scale. Manufactures (including mining industries) amounted in value to 905,000,000 roubles (\$452,500,000) in 1878, and in 1890 the total valuation of the output reached 1,656,000,000 roubles (\$828,000,000), irrespective of the smaller industries, of which statistics are unobtainable. First place among the manufactures of Russia is held by cotton, of which the manufactured output not only supplies the home demand, but furnishes a considerable amount for export. The enormous increase has brought cotton almost into the position of a staple crop in Southeastern Russia in Europe and the Southern Asian regions of the empire, notably Turkestan. The total valuation of the output of this industry in 1890 was 487,100,000 roubles (\$243,550,000). The number of spindles in Russia is about one-fourth those of continental Europe and about one-seventh those of England.

The petroleum-refining industry affords perhaps the most interesting figures. Customs protection was granted in the sixties. In 1876 Russia imported a large amount of petroleum products from the U. S., 2,666,666 pounds (95,999,876 lb. of illuminating oil alone. In the eighties the importation ceased, but the export increased, reaching in 1890 1,724,000,000 lb., and the home consumption, which, owing to the high price, reached only 144,000,000 lb. in 1876, rose to more than 1,080,000,000 lb. in 1890 owing to the rapid fall of price.

The beet-sugar industry has reached considerable proportions. In 1891 the growth of beets amounted to 80,000,000 cwt. The manufacture of woollens is sufficiently developed to clothe the army and satisfy the home demand for low-grade goods. Silk is manufactured to the value of \$6,957,000; paper, \$9,000,000; tannery products, \$19,000,000. Of beer there were brewed 99,606,087 gal. Tobacco-manufactures amounted to 34,202,000 lb. (of which 5,882,400 lb. was in cigarettes). The number of flour-mills in the empire in 1890 was 7,003, and they produced 2,462,569 tons of flour valued at \$73,000,000. The total number of manufacturing in Russia (exclusive of Poland and Finland) is 65,000, employing about 1,000,000 work-people; Poland has 21,000, employing 142,900; Finland (1890), 6,496 manufacturing, employing 59,176.

**Trade and Commerce.**—The exports of the empire have

including the ministers who have seats *ex officio* and several members of the imperial family. It is a consultative body in legislation, and its chief function is to review projects of laws presented by the ministers, and to consider the annual budget. It is divided into the three departments of legislation, administration, and finance, with a special department for the discussion of appeals to the emperor from decisions of the senate. The third of the councils is the ruling senate, whose members are appointed by the emperor chiefly from persons of high rank or office. While the council of the empire is consultative in its nature, the senate is partly executive and partly judicial. It promulgates the laws and constitutes the high court of justice. Seven of its nine departments are administrative, and two are courts of cassation. The former examine into the general administration, review the acts of governors and settle disputes with the *zemstvos*. A special department of seven members passes judgment in political offenses. The fourth council is the holy synod, which is composed of the metropolitans and bishops of the Church, and has the superintendence of religious affairs.

For administrative purposes the empire is divided into governments and districts. European Russia proper contains fifty governments, each of which is subdivided into districts varying from eight to fifteen. Poland, Finland, Moscow, Kieff, and Vilna constitute general governments, each composed of a number of the minor governments. Asiatic Russia embraces four general governments, Caucasus, Turkestan, Stepnoye, and Amur, comprising about thirty governments and territories, besides a number of districts which are treated as distinct. Each general government has a governor-general representing the czar, who has supreme direction of civil and military affairs. In the minor governments the governor is assisted by a council of regency, to which all measures must be referred. A council of control is also provided, depending directly on the ministry or Department of General Control. In the frontier provinces military as well as civil governments are established.

In European Russia the local administration is largely in the hands of the people. They do not dwell on scattered farms but are grouped in villages, and each of these villages constitutes a commune or *mir*, which is the unit of political organization. The number of communes reaches 107,493. The land held by a village is regarded as belonging to the whole community, and is apportioned among the families according to the number of their working units. The communal assembly is composed of all the householders, who elect one of their own number elder (*starosta*) or executive, and consider and decide all communal affairs. The communes are united into *volosts*, each containing about 2,000 householders. The *volost* assembly is composed of delegates from the village communes, one for every ten houses, who elect a *volost* elder (*starshina*), and who have the same powers for the *volost* which the communal assembly have for the commune. Their freedom is, however, restricted by the supervision of an imperial official. The *volost* assemblies also choose a peasants' tribunal of several judges, who have jurisdiction of offenses of all classes and of property disputes involving not over 100 roubles. Disputes of larger amount come under chiefs of the districts who are taken from the nobility, and have a certain control over the peasants' tribunals. The system of local self-government is extended measurably to the district and province, where the administration of economical affairs is placed in the hands of an assembly called the *zemstvo*, made up of nobles possessing a certain amount of land and delegates elected by other landed proprietors, by the householders in the towns, and the peasantry. The executive power rests with the *uprava*, who is nominated by the delegates. The powers of the *zemstvos* extend to matters of education, roads, schools, public health, taxation, etc., and in many cases they have done valuable work and shown a progressive spirit; but their independence is affected by the supervision exercised by the governor as the representative of the imperial government. Of the votes which elect the *zemstvos*, 64 per cent. belong to the peasants, 12 per cent. to nobles, and the remainder to the clergy, merchant, and artisan classes. Of the delegates elected 38 per cent. by the latest statute belong to the peasants, and 35 per cent. to the nobles. In central Russia two-thirds of the executives are nobles, and in East Russia two-thirds are peasants.

The *zemstvos* and towns have a method of organization similar to that of the *zemstvos*. All house owners and taxpayers are grouped according to their assessment, and are

then divided into three classes, each class holding a proportion of the total valuation, and each electing a number of representatives to the *duma*, or municipal assembly. The *duma* chooses the *uprava*, or executive.

The annual revenue of the imperial Government is 1,100,000,000 roubles, or \$550,000,000, and the expenditure about the same. The chief sources of revenue are taxes on spirits (about \$135,000,000), tobacco and sugar taxes (about \$75,000,000) and stamp duties, and revenues from state domains. The direct land and personal taxes of the imperial treasury amount to about \$25,000,000. The receipts of the *zemstvos*, or provincial assemblies, amount to \$25,000,000, of which the bulk is in land taxes. The peasant paying the tax pays an average of 9-6 copesks, or 4-8 cents, per acre. The aggregate expenses of the *zemstvos* on the last accessible accounts averaged 1-6 roubles, or 80 cents, per male of population. The expenses of the village average 1-16 roubles, or 58 cents, per male. The total of direct taxes annually paid by the peasants to the imperial treasury amounts to 118,000,000 roubles, of which 47,000,000 are for the redemption of debt for the purchase of land, and about 5 roubles per head of adult males.

Theoretically, each able-bodied male in Europe (with the exception of doctors, teachers, clergymen, etc.) should serve five years in the active army, three years in the reserve, and five years in the second reserve. In practice, however, over two-thirds are enlisted in the reserves, which drill six weeks twice a year. The footing for the entire empire is nearly 900,000 men and 160,000 horses; the war footing is over 2,500,000 men and 575,000 horses. The navy embraces power fleets on the Baltic and on the Black Sea, and smaller ones on the Caspian and on the Pacific coast of Siberia. See *NAVY*.

**Religion and Education.**—The established religion of the empire is that of the Greek Church, or Orthodox Catholic faith. There are no very accurate figures as to membership in this Church and other sects, but estimates made with care for 1888 show the number as follows: For Russia proper, Greek Church (army and navy), 69,808,407; Roman Catholics, 8,700,000; Protestants, 2,350,000; Jews, 3,000,000; Mohammedans, 2,000,000; United Church and Armenians, 55,000; pagans, 25,000. Poland the adherents in 1890 were: Roman Catholics, 504; Jews, 1,134,268; Protestants, 445,013; Greek Church (without army), 318,855. The number of Dissenters is estimated to be at least 12,000,000, and it is probable that many of them are wrongly accredited to the Greek Church. They have felt, like the Jews, but far less rigorously, the restrictions of the state and society. With the exception of the two bodies all religions enjoy freedom from restriction. Affairs of the Roman Catholic Church are centered in the legation, and those of the Lutheran Church in a consistory, both located in St. Petersburg. The Protestants are Lutherans, who came into the empire originally from Prussia and are mostly settled in the provinces of the north. The preponderance of the Roman Catholics is in the south, the Jews inhabit mostly the towns and villages of the north and Western and Southwestern Russia, while the Armenians are in the eastern and southern part of the empire. Besides these there are a great number of small sects, embodying almost every conceivable variety of fanaticism. See *RASKOLNIKS*.

The schools of the empire are for the most part under the ministry of Public Instruction, and the empire is divided into fourteen educational districts, corresponding to the large cities, but some special schools are under other ministries. The money contributed for education in the budget for 1893 was \$41,000,000. The education is as yet only in a formative condition, and though a beginning has been made and many excellent schools of the higher class—universities and special schools—have been opened, the general level of education is low. There are not numerous outside of St. Petersburg, Moscow, and Warsaw, but there are valuable ones in the provinces. The Imperial Library in the capital is one of the best in the world. In the arts, sciences, and literature Russia has developed much that is admirable and exciting, and has the finest fruits of genius, sometimes starting at a bound and nearly always vigorous and virile. The empire produces an immense production of books—2,588,000 in 1892, exclusive of Finland, with an aggregate of 1,000,000 copies, the preponderance in Russian (6188,000), the remainder in the Polish, Hebrew, German, Latvian, and

nian languages. Periodicals numbered 743 in 1892 (exclusive of Finland), of which 589 were in the Russian language. The separate publications for 1893 (exclusive of Finland) reached 10,242, of which 33,875,200 copies were printed, and in 1894 there were 779 periodicals.

**History.**—It was not until the advent of Peter the Great (1689-1725) that Russia really entered the arena of modern civilization, and became a forceful factor in Europe. Its origin lies in obscurity, and for centuries its history consists of faintly traced migrations and conflicts of primitive and rude nomadic tribes and fragments of nations. Four centuries before Christ the Greeks founded commercial stations among semi-savages called Scythians and Sarmatians, whom they discovered upon the northern coast of the Black Sea along the Sea of Azov, and in the Crimea. There, for 500 years, this barbarous horde hung upon the boundaries of an unknown expanse and the frontiers of the Greek and Roman world. But in the fourth century came other masses of semi-savages, the Goths and Huns, Avars and Alans, who swept over them in successive waves. Then in the sixth century the Slavs appeared on the pages of history. Believed to have been related to the Sarmatians, they occupied the country as far N. as the upper Volga. Encountering the Finns, they drove the major portion toward the Baltic and Arctic, and, absorbing the remainder, developed the composite Russian type with sallow complexion and flaxen hair. Flourishing in power the Slavs founded Kieff and Novgorod, each the capital in time of a principality. After the lapse of a century, which is a blank in their annals, they were overrun by a tribe of the Northmen, the Varangians, called by the Slavs the Rus, from whom the name Russian was derived, first appearing in the ninth century. The Rus dominated both the Finns and Slavs, but the latter, after throwing off the yoke, long suffered from outward attack and internal dissension, and at a crucial moment, to avert anarchy, importuned the Rus or Varangian chief Rurik to become their ruler. He went to Novgorod in 862, and it was he who laid the foundation of the Russian empire, over which his family reigned seven centuries. His cousin and successor, Oleg (879-912), a powerful and wise ruler, conquered Kieff, thus greatly enlarging his dominion, defeated various bordering tribes, and even attacked, with 900 vessels, the Emperor of Constantinople, with whom he concluded in 911 an advantageous peace. Igor, the son of Rurik (912-945), added to the country by conquest, made an unsuccessful war against the Emperor of Constantinople in 941, and was killed in battle against the Drevlians, a Slavonic tribe. His widow, Olga, whose name to this day is a national word with the Russians, reigned during the minority of her son Sviatoslaff, and introduced Christianity into the country, she herself being baptized in Constantinople in 957. Sviatoslaff (945-973) remained a pagan, extended the borders of the empire to the Sea of Azov, and in 970 divided it among his three sons, Yaropolk I. (973-980), Oleg, and Vladimir. War arising between the brothers, Oleg was slain, Vladimir fled, and Yaropolk, originally ruling Kieff, reunited the empire, only to be reconquered and put to death by Vladimir, who returned in 980 with a horde of the Rus or Varangians, and became the sole ruler of all Russia. Surnamed The Great because of his conquests and his beneficent measures, he made Christianity the official religion of the empire, founded churches, schools, and new towns, and divided the empire among his twelve sons, who engaged in fratricidal war before the death of their father, after which Sviatoslaff (son of Yaropolk I., but adopted by Vladimir) ascended the throne after murdering three of his brothers, only to be deposed in war with another brother, Yaroslav (1019-54), who succeeded in reuniting and extending the empire by successful wars, and emulated his father's example in reforms. During the next three centuries events led to an ultimate enlargement of dominion, and a more thorough organization of the government, preceded by the breaking of the Russian monarchy into a confederacy, its restoration, the constant struggle of internecine war, and the capture of large regions of Western Russia by the Poles, Lithuanians, Danes, and the Teutonic knights. The early part of the period was nevertheless one of general progress, and important cities were founded, among them Tver and Moscow, the latter in 1147. But in the beginning of the thirteenth century came the sweeping Mongol invasion from Eastern Asia under Genghis Khan, which the Russians, save at Moscow, could not withstand. This was followed by internal strife, famine, and pestilence. In 1230 30,000 men died of the plague in Smolensk, and 42,000 in Novgorod. Then

came another Mongol horde demanding tribute, and putting to fire and sword all who failed to render it. In the next century the Russians had gathered strength, and under the Prince of Moscow, Dmitri Donskoi, they repelled the incursions of 1378 and 1380, only to be overwhelmed by the numbers of the invaders in 1382, when Moscow was burned and 24,000 of its people slain. Ivan the Great (1462-1505) so built up the power of arms that the Mongols were defeated, and, decay having set in among them, an era of freedom from their assaults was entered upon, greatly to the relief of the Russians, who began to extend their dominion to the E., conquering Kazan in 1489 and parts of Siberia in 1499. It was under this ruler that one of the fixed features of the "Russian policy," a jealous regard for Constantinople, had its inception. Russia looked to Constantinople as its model of civilization, and took its initiatives in art, especially architecture, in literature, in religion, and in the externals of life, and when that city fell into the hands of the Turks in 1453 Ivan became the devotee of the Byzantine policy, which has influenced all subsequent Russian statesmanship. Ivan IV., The Terrible (1533-84), conquered Astrakhan (1556), the region of the Don Cossacks (1570), and a portion of Siberia (1581), opened a road to Archangelsk, established a printing-press in Moscow in 1569, and did many meritorious acts and a single infamous one, which gave him the surname of The Terrible, namely, the slaying and torture of 60,000 citizens of Novgorod, that city having revolted from his iron rule in 1570. The house of Rurik ceased to exist with the death of Ivan's son Feodor I. (1584-98), believed to have been poisoned, and, after the brief reigns of several rulers and much intrigue, revolution, war, and among other evils a great famine in 1601 by which 100,000 people perished in Moscow alone, the first of the Romanoffs, Michael Feodorovitch, was elected czar by the boyars or noblemen in 1613. He promoted the internal prosperity of the country, revived the long prostrate commerce, and in 1639 extended the borders of the Asiatic possessions to the Pacific. He was succeeded by his son Alexis (1645-76), and his son Feodor III. (1676-82), whose reigns were signalized by many important reforms; and then, after intrigue and conspiracy, in which his sister Sophia sought the rulership, and in fact exercised a regency which her brother overthrew, there ascended the throne as czar the most colossal figure in Russian history, Peter the Great. Within a few years under his guidance Russia became the most powerful nation of Northern Europe, and was recognized as a potent member in the political system of the Continent. Peter was the first to bear the proud title of Emperor of Russia. In 1703 he founded St. Petersburg as the new capital of the empire. In 1696 he took Azov from the Turks; in 1709, by his decisive victory at Poltava over Charles XII., he ended an arduous campaign in the destruction of Sweden's supremacy; in 1721, by the peace of Nystadt, he added Ingria and parts of Karelia, Esthonia, and Livonia to his realm, and in 1723, by his prowess and shrewd diplomacy, secured the provinces of Daghestan and other territory on the Caspian, ceded by Persia. Besides all this he introduced varied internal reforms and improvements of vast extent and importance. His surpassing service, however, was in opening the door of Russia to Western Europe, and putting his people in touch with a civilization superior to the Byzantine standard, which they had long accepted. Never probably in the history of the world were so obdurate and refractory a people absolutely impelled by the will of one man to so great an advance as that which the Russians made under the virile sway of Peter the Great. He died Feb. 8, 1725, but the reforms he instituted, the great public works he began, and the policy he introduced, were carried forward by his successors, for they and the people seemed to have become infused with something of his spirit and energy. Thus Catherine I. (1725-27), Peter II. (1727-30), Anne (1730-41), Elizabeth (1741-62), each contributed something to progress, the last named founding in Moscow the first Russian university, and Catherine II. (1762-96), more than all combined. Catherine was the most picturesque of the rulers of Russia, shrewd, brilliant, capricious, of lax morals and large intellect, cultivating the arts and letters, given to show and also to great enterprises. While surrounding herself with an imposing array of statesmen, soldiers, and courtiers of doubtful repute, she was the professed patron of public morality, and founded innumerable churches, schools, and benevolent institutions; more imperiously despotic than any of her immediate predecessors, she nevertheless convoked an assembly of delegates from all the districts to frame a new and more

including the ministers who have seats *ex officio* and several members of the imperial family. It is a consultative body in legislation, and its chief function is to review projects of laws presented by the ministers, and to consider the annual budget. It is divided into the three departments of legislation, administration, and finance, with a special department for the discussion of appeals to the emperor from decisions of the senate. The third of the councils is the ruling senate, whose members are appointed by the emperor chiefly from persons of high rank or office. While the council of the empire is consultative in its nature, the senate is partly executive and partly judicial. It promulgates the laws and constitutes the high court of justice. Seven of its nine departments are administrative, and two are courts of cassation. The former examine into the general administration, review the acts of governors and settle disputes with the zemstvos. A special department of seven members passes judgment in political offenses. The fourth council is the holy synod, which is composed of the metropolitans and bishops of the Church, and has the superintendence of religious affairs.

For administrative purposes the empire is divided into governments and districts. European Russia proper contains fifty governments, each of which is subdivided into districts varying from eight to fifteen. Poland, Finland, Moscow, Kieff, and Vilna constitute general governments, each composed of a number of the minor governments. Asiatic Russia embraces four general governments, Caucasus, Turkestan, Stepnoye, and Amur, comprising about thirty governments and territories, besides a number of districts which are treated as distinct. Each general government has a governor-general representing the czar, who has supreme direction of civil and military affairs. In the minor governments the governor is assisted by a council of regency, to which all measures must be referred. A council of control is also provided, depending directly on the ministry or Department of General Control. In the frontier provinces military as well as civil governors are established.

In European Russia the local administration is largely in the hands of the people. They do not dwell on scattered farms but are grouped in villages, and each of these villages constitutes a commune or mir, which is the unit of political organization. The number of communes reaches 107,493. The land held by a village is regarded as belonging to the whole community, and is apportioned among the families according to the number of their working units. The communal assembly is composed of all the householders, who elect one of their own number elder (*starosta*) or executive, and consider and decide all communal affairs. The communes are united into volosts, each containing about 2,000 householders. The volost assembly is composed of delegates from the village communes, one for every ten houses, who elect a volost elder (*starshina*), and who have the same powers for the volost which the communal assemblies have for the commune. Their freedom is, however, restricted by the supervision of an imperial official. The volost assemblies also choose a peasants' tribunal of several judges, who have jurisdiction of offenses of all classes and of property disputes involving not over 100 roubles. Disputes of larger amount come under chiefs of the districts who are taken from the nobility, and have a certain control over the peasants' tribunals. The system of local self-government is extended measurably to the district and province where the administration of economical affairs is placed in the hands of an assembly called the zemstvo, made up of nobles possessing a certain amount of land and delegates elected by other landed proprietors, by the householders in the towns, and the peasantry. The executive power rests with the uprava, who is nominated by the delegates. The powers of the zemstvos extend to matters of education, roads, saloons, public health, taxation, etc., and in many cases they have done valuable work and shown a progressive spirit; but their independence is affected by the supervision exercised by the governor as the representative of the imperial Government. Of the votes which elect the zemstvos, 64 per cent. belong to the peasants, 12 per cent. to nobles, and the remainder to the clergy, merchant, and artisan classes. Of the delegates elected 38 per cent. by the latest statistics belong to the peasants, and 35 per cent. to the nobles. In Central Russia two-thirds of the executives are nobles and in East Russia two-thirds are peasants.

The cities and towns have a municipal organization similar to that of the zemstvos. All houseowners and taxpayers are enrolled according to their assessment, and are

then divided into three classes, each class holding an equal proportion of the total valuation, and each electing an equal number of representatives to the дума, or municipal assembly. The дума chooses the uprava, or executive.

The annual revenue of the imperial Government is about 1,100,000,000 roubles, or \$550,000,000; and the expenditures about the same. The chief sources of revenue are the excise on spirits (about \$135,000,000), tobacco and sugar, the customs (about \$75,000,000) and stamp duties, and returns from state domains. The direct land and personal taxes for the imperial treasury amount to about \$25,000,000. The annual receipts of the zemstvos, or provincial assemblies, approach \$25,000,000, of which the bulk is in land taxes. The land paying the tax pays an average of 9·6 copecks, or 4·8 cents, per acre. The aggregate expenses of the zemstvos at the last accessible accounts averaged 1·6 roubles, or 80 cents, per male of population. The expenses of the village communes average 1·16 roubles, or 58 cents, per male. The total sum of direct taxes annually paid by the peasants to the imperial treasury amounts to 118,000,000 roubles, of which 41,000,000 are for the redemption of debt for the purchase of land, or about 5 roubles per head of adult males.

Theoretically, each able-bodied male in European Russia (with the exception of doctors, teachers, clergymen, etc.) should serve five years in the active army, thirteen years in the reserve, and five years in the second reserve (*Zapas*); in practice, however, over two-thirds are enlisted directly in the reserves, which drill six weeks twice a year. The peace footing for the entire empire is nearly 900,000 men and about 160,000 horses; the war footing is over 2,500,000 combatants and 575,000 horses. The navy embraces powerful flotillas on the Baltic and on the Black Sea, and smaller ones on the Caspian and on the Pacific coast of Siberia. See *SHIPS OF WAR*.

**Religion and Education.**—The established and official religion of the empire is that of the GREEK CHURCH (*q. v.*) or Orthodox Catholic faith. There are no very accurate figures as to membership in this Church and the various sects, but estimates made with care for 1888 show the number as follows: For Russia proper, Greek Church (without army and navy), 69,808,407; Roman Catholics, 8,300,000; Protestants, 2,950,000; Jews, 3,000,000; Mohammedans, 2,600,000; United Church and Armenians, 55,000; pagans, 26,000. In Poland the adherents in 1890 were: Roman Catholics, 6,214,504; Jews, 1,134,268; Protestants, 445,013; Greek Church (without army), 398,855. The number of Dissenters is estimated to be at least 12,000,000, and it is probable that many of them are wrongly accredited to the Greek Church. They have felt, like the Jews, but far less rigorously, the persecutions of the state and society. With the exception of these two bodies all religions enjoy freedom from restraint. The affairs of the Roman Catholic Church are centered in a collegium, and those of the Lutheran Church in a consistory, both located in St. Petersburg. The Protestants are mainly Lutherans, who came into the empire originally from Germany and are mostly settled in the provinces of the Baltic. The preponderance of the Roman Catholics is in Poland, the Jews inhabit mostly the towns and villages of Poland and Western and Southwestern Russia, while the Mohammedans are in the eastern and southern part of the empire. Besides these there are a great number of small sects, embodying almost every conceivable variety of fantastic fanaticism. See *RASKOLNIKS*.

The schools of the empire are for the most part under the ministry of Public Instruction, and the empire is divided into fourteen educational districts, corresponding to the large cities, but some special schools are under separate ministries. The money contributed for education in the budget for 1893 was \$31,000,000. The educational system is as yet only in a formative condition, and though a good beginning has been made and many excellent schools of the higher class—universities and special schools—are in existence, the general level of education is low. Libraries are not numerous outside of St. Petersburg, Moscow, and Warsaw, but there are valuable ones in those cities, and the Imperial Library in the capital is one of the richest in the world. In the arts, sciences, and literature Russia has developed much that is admirable and exhibited occasionally the finest fruits of genius, sometimes startling and strange, and nearly always vigorous and virile. The press pours forth an immense production of books—9,588 in the year 1892 (exclusive of Finland), with an aggregate of 30,639,550 copies, the preponderance in Russian (7,188), and the remainder in the Polish, Hebrew, German, Lettish, and Esth-

liberal code of laws; apparently absorbed in the sensual pleasures of a sumptuous life, and the petty personal intrigues of a corrupt court, she yet accomplished such solidly practical works as bringing 50,000 high-class German and Swiss immigrants into the country. By wars, and by diplomacy which compelled admiration, she acquired 225,000 sq. miles of territory, carrying on simultaneously an immense internal improvement and elaboration of the plan of government. In several successful wars she took from the Turks the Crimea and Azov, with other territories, and in the final dismemberment of Poland (1796) secured to the empire two-thirds of that kingdom. Under her rule Russia made signal advance as an influential power in Europe. Her son Paul (1796-1801) joined the coalition against the French republic, but after the victories of Suwaroff in Italy, followed by disasters on crossing the Alps, the fickle monarch veered to the side of Napoleon. But his rule was unbearable, and he was assassinated. Alexander I. (1801-25), through the shifting scenes of the long Napoleonic struggle, played a leading rôle in the European drama, and raised Russia to the foremost place in the continental balance of power. Ardent, impulsive, and impressionable, he conceived large policies, and his imagination was easily moved. Entering the third coalition against Napoleon he shared with Austria the defeat at Austerlitz (1805), where he was present on the field. The fourth coalition with Prussia followed, and after the sanguinary and indecisive battle of Eylau (1807) and the conclusive defeat of the allies at Friedland, Alexander accepted the peace of Tilsit (July 7, 1807), by which he allied himself with his former adversary, and closed the ports of Russia to Great Britain. The two monarchs proceeded as if dividing the world between them, Napoleon to take the West and Alexander the East. Alexander moved against Persia and gained Shirvan. By the peace of Frederikshamn (1809) he acquired Finland from Sweden, and after a war with Turkey added Bessarabia to his possessions. Growing restive under the continental blockade, he broke with Napoleon, and the memorable invasion of Russia in 1812 followed. At the head of more than half a million men Napoleon defeated Alexander at Smolensk, again at Borodino, and entered Moscow, which the Russians themselves then fired and well-nigh burned to the ground. Vainly seeking to negotiate peace he turned in hasty retreat, and began the disordered and appalling winter flight which destroyed his great army. In 1813 Prussia and Austria joined Russia in war against France, and the battle of Leipzig decided the contest, leaving Alexander foremost among the victorious sovereigns, and acclaimed as the liberator of Europe. In the reorganization of European politics through the congresses of Vienna and Aix-la-Chapelle his influence was dominant. He founded the Holy Alliance and became the pillar of reaction against the progressive tendencies of the age. His internal policy experienced a similar change. During his earlier years he had shown a liberal disposition. He sought to improve public education, founded universities, advanced the condition of the serfs, fostered industrial and commercial enterprises, and relaxed harsh political and judicial methods. In his later years, suppression, censorship, and police rigor became the rule. Detested ministers aroused general hostility, and secret societies multiplied. The gay hero of other days became the conscious object of wide discontent, and sank into a morose and dejected state. His death quickened the outbreak of a revolutionary conspiracy, which found its immediate occasion in the change of succession from the elder to the next brother; but the new sovereign, Nicholas I. (1825-55), suppressed it with great vigor, and sternly executed or exiled the chief conspirators. Throughout his reign Nicholas displayed reactionary tendencies. Commanding, imperious, and autocratic, he upheld the principle of absolutism with a resolute hand. In a war with Persia, from 1826 to 1828, Russia completely triumphed, and gained the provinces of Erivan and Nakhitchevan, a heavy indemnity, and the exclusive control of the Caspian Sea. Next came war with Turkey in defense of the struggling Greeks. The alliance of Russia, France, and Great Britain led to the victory of Navarino (1827), annihilating the Turkish fleet. Russia continued the contest, achieved full success, and forced Turkey, through the peace of Adrianople, to cede the mouths of the Danube and pay indemnity. The heroic Polish insurrection of 1831 was energetically suppressed, and followed by measures which reduced the kingdom to a province, stripped of the distinct constitution granted by Alexander, of its own diet and its own army. The policy of Russianizing these and other alien fragments

of the empire into a homogeneous people became one of the features of Nicholas's reign. The revolutionary epoch of 1848 emphasized his reactionary spirit. In 1849 he sent a Russian army to aid Austria in crushing the Hungarian revolt. In 1853 Russia's demands for the protection of Greek Christians in Turkey precipitated the Crimean war, wherein Great Britain, France, and Sardinia joined Turkey upon the plea that Russia's demands covered the design of Turkish dismemberment. The defeats of the Alma, Balaclava, and Inkermann, and the siege of Sebastopol, deeply chagrined Nicholas, who died in disappointment, and left the war as a legacy to his son Alexander II. (1855-81), who hastened to bring it to a conclusion.

By the treaty of Paris (1856) Russia relinquished the right to keep war-vessels on the Black Sea, and lost a part of Bessarabia. But during the Franco-German war (1870), when no resistance could be made, she announced her resumption of supremacy on the Black Sea, and Bessarabia was restored by the treaty of Berlin (1878). From the first, Alexander evinced liberal tendencies. He opened the empire more than ever before to the arts, ideas, and civilization of the West. In 1861 he gained the title of The Liberator, by decreeing the emancipation of the serfs. This great reform reconstructed the economic and political relations of the people. The state indemnified the landlords, and the peasants became the collective possessors of the communal land. In 1863 a fresh Polish insurrection was suppressed by Mouravieff with great rigor. Aside from this severity, the reign was signalized by liberal progress and unprecedented material development. Conspicuous among its features was the prosecution of the Russian advance into Asia. In 1858, by treaty with China, Russia acquired all the left bank of the Amur. The capture of Schamyl in 1859 ended the persistent revolt in the Caucasus. A double advance into Central Asia was made in 1863, and in the period from 1865 to 1868 Tashkend, Khojend, and Samarcand successively fell into Russian hands. The Khiva expedition of 1873, ending in the capture of Khokan in 1875, completed the conquest of Central Asia. Outbreaks of the Slavonic Christians within the sultan's domains led Russia in 1877 to war with Turkey. The treaty of San Stefano (1878), which crowned Russia's triumph, modified by the Congress of Berlin, liberated and readjusted the Balkan principalities, enlarging Servia, making Roumania independent, and creating free Bulgaria subject to Turkish suzerainty. The later years of Alexander's reign were marked by the rapid development of Nihilism. His progressive policy, however, continued, and under the influence of the liberal minister Loris Melikoff a constitutional project providing for a consultative assembly of delegates elected by the provincial zemstvos had been signed and was about to be proclaimed by the emperor, when, after four attempts had failed, he was assassinated Mar. 1 (13), 1881. His son and successor, Alexander III. (1881-94), had been consulted as to the proposed project, and had assented, but upon his accession other influences prevailed, and the reform which would have been the first step toward parliamentary government was not promulgated. Melikoff gave place to Ignatieff, and reactionary forces became dominant. Panslavism asserted itself with new vigor. Violent anti-Semitic outbreaks occurred in different parts of the empire, and were followed by the May laws of 1882, which restricted the Jews to the pale of settlement, consisting of fifteen provinces of the southwest, and imposed other restraints upon them. After a short period these laws became obsolete, but in 1890 measures were again taken for their partial enforcement, until the public opinion of other countries remonstrated. Except in minor and spasmodic clashes in Central Asia, the reign of Alexander III. was free from war. In foreign relations he sedulously cultivated peace, and came to be known as the peace-keeper of Europe. He threw off the subservieny to Germany which had marked much of Russian statecraft, and without alienating the friendship of the powers of the Triple Alliance he encouraged France as a counterpoise for peace. In Bulgaria his hand rested heavily on Prince Alexander, who finally abdicated. In contrast with the policy of his predecessor, he discouraged Western influence, and devoted himself to developing the national spirit of his own people. He was a Russian of Russians. Well-meaning and conscientious, he sympathized with the spirit of political and religious reaction, and it stamped the character of his reign. He died Nov. 1, 1894. His son and successor, Nicholas II., mounting the throne at twenty-six years of age, was married immediately after his accession to Princess Alix of Hesse.

Thus in Gr. Russ. the datives of *nogá, ruká* are *nog'é, ruk'é* (pron. *nogjé, rukjé*), while L. Russ. *noz'í, ruc'í* abide by the old Slavic *nozé, rucé*. Gr. Russ. locative of *duch* is *duch'é* (pron. *duchje*): L. Russ. *duš'í*. Gr. Russ. imperative of *ljagú* is *ljagi*: L. Russ. *ljaz'*. The Gr. Russ. has lost the vocat. sing. masc. and femin., while the L. Russ. has kept it; thus Gr. Russ. *drug moj, syn moj*, but L. Russ. *družé moj, synu moj*; Gr. Russ. *dušá moja*: L. Russ. *dušo mojá*.

On the whole, Great Russian has been more conservative than Little Russian, in part owing to the fact that the former has been more uninterruptedly and strongly influenced by the Church Slavonic. Although the Little Russians, like the Great Russians, are adherents of the Greek confession (only a fragment of the Little Russian—namely, in Galicia—holds to Rome), and use the same Church Slavonic in the liturgy, yet under the influence of the Roman Catholic Poles and their higher civilization, which lasted for centuries, the prestige of the Church Slavonic yielded much earlier than with the Great Russians, and even as early as the sixteenth century the folk-speech acquired some recognition. This is particularly true of the Ruthenian dialect in Galicia, which was recognized in the schools and in official use. In vocabulary and syntax it has been strongly influenced by the Polish, and differs in many points from the much purer and more original Ukrainian dialect.

The rivers Pripiet and Desna, emptying into the Dnieper, form the northern boundary of Little Russian against the White Russian and Great Russian. The northern line extends on to the Don below the cities Kursk and Voronej, whose vicinity is South Great Russian. S. of this line dwell the Little Russians, stretching W. even beyond the boundaries of Russia into Galicia, and even over the Carpathians into Northeastern Hungary. Farther to the S. they border in Bessarabia upon the Roumanians, the Black Sea forming their southern boundary. They extend on the E. as far as the Don, though here mixed with the Great Russians. They also occupy, mixed with Great Russians, the districts of Kuban and Tschernomorje to the E. of the Sea of Azov.

The South or Little Russian dialect consists of several closely related varieties. Of greatest extent is the Ukrainian variety which covers Podolia and Bessarabia, the provinces of Kieff, Poltava, Kherson, Kharkoff, Ekaterinoslaf, Taurida, part of Voronej, and the lower valley of the Don. N. of this extends the Polesje variety, occupying a part of Volhynia and the province Chernigoff. W. of the Ukrain appears the so-called Red Russian (called in Galicia Ruthenian), covering Podolia, Galicia into the Carpathians, and on thence into Hungary, and Bukovina.

The Great Russian in its widest sense includes the Great Russian proper and the White Russian. The latter forms in some sense a transition to the Little Russian, and is therefore by some authorities regarded as a branch of Little Russian, while others prefer to treat the White Russian as a third main division. The linguistic facts favor, in the opinion of the writer, the reference of White Russian to the Great Russian group. The characteristic peculiarities of White Russian are, in the vocalism, the spread of the vowel *a* or *ia* not only to displace *o*, but also *e*, generally in unaccented syllables: *zjaljóny* (for *zeljóny*), *bjarjóza* (for *b'erjoza*), *sjaljcó* (for *seljcó*), etc.; in consonantism, the pronunciation of soft *d* and *t*, as *dz, ts*, as *tsérem* for *t'erem*, *dzérjats* for *djevjat'*, etc.

The White Russians occupy the provinces of Vilna, Vitebsk, Minsk, Moghilev, and also extend into the provinces of Pskoff, Tver, and Smolensk. Physically they are the weakest and most unenergetic of the Russian race, and until recent years were entirely subject to the dominating influence of the Poles.

The Great Russians proper, the most numerous, the strongest, and the most enterprising Russian tribe, early effected from old Novgorod the colonization of the north, and later from Moscow secured the control of all European and Asiatic Russia. They are divided into two groups on the basis of the pronunciation of the unaccented *o*-vowel—an *o*-group (northern) and an *a*-group (southern), the former called North Great Russian, the latter South Great Russian. The North Great Russians occupy the entire north of European Russia down to the province of Tver, the greater part of which speaks *o*, then on to the province of Moscow, where only a small territory in the extreme north speaks *o*. Almost the whole of the province of Vladimir and the northern parts of Nijni-Novgorod and Kazan are included in the *o*-group; so also the Ural region and parts of Siberia.

The South Great Russians, or the *a*-speakers, occupy parts of the province of Smolensk, almost all of Moscow, all of Kaluga, Tula, Orel, Ryazan, Tamboff, Kursk, Voronej (so far as it is Great Russian), the southern parts of Nijni-Novgorod, and Kazan, the province of Penza, and also Simbirsk, Samara, and Saratoff.

The chief difference between the North Great Russians and the South Great Russians lies in the pronunciation of *o* as *o* by the former, and as *a* (either pure or as *a'*, i. e. midway between *a* and *o*) by the latter. This applies only to unaccented syllables. Cf. N. Gr. Russ. *slóvo, máslo, zachot'*: S. Gr. Russ. *slóva, másla, zychat'él*. The *a*-speakers are distinguished by a broad pronunciation, whereas among the *o*-speakers the sound *o* is often close, almost like *u*. They are therefore called also the Low Great Russians. A further difference between the two varieties is that unaccented *e* in South Great Russian generally, except at the end of words, is pronounced almost as *i*—e. g. *p'iró* for *p'eró*, *v'izú* for *v'ézú*, *p'irichód* for *p'erechód*—whereas in North Great Russian this same unaccented *e* is freely rendered as *jo*—e. g. *pjoró, vjózú, sjoló, bjodró* (S. Gr. Russ. *s'iló, b'idró*): cf. N. Gr. Russ. *javó* (for *jegó*): S. Gr. Russ. *jivó*. The North Great Russian exhibits furthermore two features lacking in South Great Russian: (1) Primitive Slavic *ě*, which usually becomes soft *e* in Great Russian, is occasionally pronounced in North Great Russian as a soft *ě*, just as in Little Russian *s'ěno* for *s'ěno*, *sv'ězka* for *sv'ězka*, etc.; (2) the widely spread pronunciation of *č* as *c* and *c* as *č*: *cort* for *čort*, *color'ek* for *čolov'ek*, *čar* for *čar'*, *čerkov* for *cerkov*. The confusion of the consonants is universal in the northern provinces, the old territory of the republic of Novgorod, whereas their correct use is limited to the southern provinces of the North Great Russian territory, viz., Tver, Vladimir, Yaroslav, Kostroma, Nijni-Novgorod, and Kazan.

*The Standard or Literary Russian.*—Until near the end of the seventeenth century, and especially since the establishment of Moscow as a political and religious center, it was a generally accepted principle that the language of the Church should be regarded as the medium of literature and of all that belonged to the intellectual or higher life. Its poverty in the means of expression occasioned, when it was applied to profane purposes—as in civil documents, laws, and later, too, in narrative literature—the adoption of popular expressions, construction, and phrases, even to the face of protest from individual writers. A dualism was not felt and not recognized, even though it may have actually existed. It remained for Russia's great reformer, Peter the Great, to determine the separation of the profane from the sacred literature, and to give it outward indication through the form of the alphabet. As early as 1697, during his residence at Amsterdam, Peter awarded a Dutch bookseller the privilege of printing Russian books in a style of type varying from the alphabet then used in Russia, and distinguished by a smoothness and roundness of form evidently borrowed from the Latin alphabet. This same form of letter was later introduced (1707) into Russia itself, and was there (Moscow) reproduced in a successful manner by the type-founder M. Jefremov. The first book printed in Russia in this new "civil type" appeared in 1708 at Moscow—a work on geometry. The czar approved so heartily of the undertaking that in 1710 he examined a collected list of letter-symbols and struck out with his own hand those which he did not approve, and gave orders that from that time those which had been approved should be used in the printing of books on historical and general subjects. The secularization of the Russian literature in speech and print was thus sanctioned through the all-powerful will of the autocrat. The language was nevertheless for some time subject to great confusion; every man wrote or translated according as knowledge or caprice might admit. Fortunately there arose soon after Peter the Great a second man of genius, who extended to the narrower field of literature and science the work begun in the larger field. This literary Peter the Great was a peasant's son from the high north, the academician, poet, physicist, grammarian, and historian, Lomonosov. He rendered to the language a service the value of which can not be easily overrated. He appreciated how to lead the confused and normless language into the right courses, into a healthy popular form tempered by historical traditions, and, while carrying out the principle of Peter the Great, he avoided laying the ban of interdiction upon the hitherto revered language of the Church. He conceived it as desirable that the language should not cease to draw its nourishment from the rich sources of

With his reign the history of modern ideas in his country begins. The peasant Pososhkov (1670-1726) was at the same time an old-fashioned theologian and a liberal political economist. Prince Antioch Kantemir (1708-44), who passed much of his life abroad, turned out satires in the style of Boileau, which even had the honor of being rendered into French. Vasilii Tatistchev (1685-1750) wrote the first history of Russia; Trediakovskii (1703-69) translated much and made a guide to versification, while unable to write good poetry himself. Far more important than any of these was Lomonosov (1711-65), not so much as an author, although he tried his talents at literature of many sorts, but as a grammarian and literary lawgiver. The language of Russian books was still under the yoke of the church Slavonic, and teemed with archaic expressions, while Western words, brought in with Western ideas, added to the general confusion in which there were no accepted models to follow. Lomonosov, in his grammar (1755), laid down the laws for all to obey, his own varied works served as examples of at least grammatical correctness, and by his successful introduction of tonic instead of the previous syllabic versification he brought Russian poetry back to the form suited to the natural genius of the language. The period that followed was very creditable, although few of the works then written are read to-day or possess originality. French influence and taste, then dominant in all Europe, were nowhere more supreme than at St. Petersburg. Sumarokov (1718-77), the first in his country to have no other profession than that of author, besides shorter poems, composed many stiff tragedies in alexandrine verse; Kniashnin (1742-91), Kheraskov (1733-1807), and others followed in the same vein, and the last named likewise composed a ponderous epic, the *Rossiada*; von Vizin (1744-92) wrote two really good comedies, *Nedorosl* (the Minor) and *Brigadier*; Kniashnin, with his *Khvastun* (the Boaster), etc., Kapnist (1757-1824), with his *Iabeda* (Calumny), succeeded nearly as well; and the Empress Catherine II. herself showed cleverness in one or two light satirical plays. Khemnitser (1745-84), and later Dmitriev (1760-1837), were successful writers of fables; Bogdanovich (1743-1803) gained a great reputation by his poem of *Dushenka*, though he ranks below Derzhavin (1743-1816), the greatest lyric poet of Russia of his time, and entitled to an honorable place among European writers of the century. He is best known for his stately if frigid odes, one of which, the *Ode to God*, was translated into many languages, including Chinese and Japanese, and hung up in a temple at Peking. The most important prose-writers of the same date were the Freemason publisher and bookseller Novikov (1744-1818), and Radistchev (1749-1802), author of the *Journey from St. Petersburg to Moscow*.

The last years of Catherine's reign were marked by a reaction against everything that savored of liberalism, and from then till after the fall of Napoleon the literary movement was less active. The most important figure was Karamzin (1766-1826), who did for Russian style much what Lomonosov had done for grammar, discarding antique forms, clumsy expressions, and foreign interpolations, besides furnishing by his own productions models for others to study and profit by. He was a many-sided writer, whose most famous works are his *Letters of a Traveler*, his sentimental novel *Bednata* (Poor) *Luisa*, and especially his great *History of Russia*. He also founded the *Vestnik Evropy* (Messenger of Europe), still perhaps the best magazine in the empire. In his political ideas he was national and conservative, and may be looked on as an ancestor of the modern Slavophiles. In this same transition period we find the dramatist Ozerov (1770-1816), whose plays, though still following for the most part the approved rules of classical tragedy, show the beginnings of the new romantic spirit.

*The Romantic School.*—The romantic school arose at about the same time in Russia as in other countries. The impulse to it came from abroad, especially from Germany and England. Goethe, Schiller, Shakspeare, and later, above all, Byron, displaced the French models of the previous generation. The great champion and genius of the new movement was Alexander Pushkin (1799-1838), the initiator was his friend Zhukovskii (1783-1852), who has left comparatively few original works, but a great number of excellent translations, which made known to his countrymen many of the masterpieces of foreign literature. His friend Kozlov (1779-1840) did much the same thing with less success, while Batiushkov (1788-1855), who early became insane, was the author of a few remarkable poems that imitate the plastic perfection of classic masters. Griboedov (murdered

in 1829 when ambassador at Teheran) left behind a comedy, *Gore of Uma* (Trouble from Cleverness), which ranks with the first of its kind in all literature. The war against Napoleon had caused a general awakening that usually took on a patriotic or liberal form. The former characteristic brought about the discovery and study of the old national *byliny*; the latter led to the December rising at the accession of Nicholas I. The young poet Ryleev (1795-1826) was hanged with others of the chief conspirators, while his friends, the critic and story-teller Bestuzhev (pseudonym *Marlinskii*, 1795-1837) and the poet Prince Odoyevskii (1802-39), were banished to Siberia and the Caucasus. Only a fortunate absence from St. Petersburg preserved Pushkin from being in the plot. He, too, had to suffer banishment from the capital on account of his liberal ideas, but his genius gained by the change of scene and particularly by his visit to the Caucasus. His first poem, *Ruslan and Liudmila*, like Victor Hugo's *Hernani*, in France, started a great controversy which resulted in the complete triumph of the romantic school. Pushkin's style both in prose and poetry approaches perfection. His shorter poems were the delight of his own and succeeding generations; his *Kapitanskata Doch* (The Captain's Daughter) served as a model of a story; his *Boris Godunov* (Eng. trans. of parts by N. H. Dole in *Poet Lore*, Boston, No. 2, 1899; Nos. 3 and 11, 1890; Nos. 8 and 11, 1891) founded genuine Russian tragedy; his *Evgenii Onegin* (Eng. trans. by Lieut.-Col. Spalding, London, 1881) is a long poem recalling *Don Juan* and *Beppo*, with passages of great beauty and still oftener of brilliant wit, and has a hero who can be looked on as the ancestor of the realistic characters of later writers. Around Pushkin gathered his friends and disciples, the poets Delvig (1798-1831), Baratynskii (1800-44), Iazykov (1803-46), Venevitinov (1805-27), Gnedich (1784-1833), the translator of the *Iliad*, and the unfortunate Polezhaev (1807-38). The greatest of Pushkin's successors was the passionate and unhappy Iermontov (1814-41), the embodiment of the Byronic spirit, which he did not live long enough to outgrow. The most combative member of the romantic school was N. Polevov (1796-1846); its great critic Belinskii (1810-48). The poet Tiuchev (1808-73) was its last distinguished survivor. Contemporary with it, but not belonging to it, were the peasant poet Koltsov (1809-42), and the writer of fables Krylov (1768-1844), who has no equal of his kind except La Fontaine.

The realistic movement begins with Gogol (1809-52), the first of the great Russian novelists. His comedy the *Revizor*, his shorter stories, and his *Mertvyya Dushi* (Dead Souls) are among the masterpieces of literature. No countries, except Great Britain and France, can compare with Russia for the number and genius of her novelists and story-tellers of both the first and the second rank. Almost contemporary with Gogol we find the later Nihilist Alexander Herten (1812-70), whose chief novel, *Kto Vinovat?* (Whose Fault?), is a plea for free love; and the series of novelists continues uninterrupted to the present day. Three names stand out above all others: Turgenev (1818-83), Dostoevskii (1822-81), and Lev Tolstol (b. 1828). Not far behind them come Goncharov (1814-91), the author of *Obломov*, *Obyknovennyya Istoria* (A Common Story), etc., and Pisemskii (1820-81), from whose works all traces of ideal have disappeared; and then numerous men of second rank like Pisarev (1840-68), Vasilii Krestovskii (b. 1840), Potekhin (b. 1829), etc. Most of them have also written short stories. Among the many especial story-tellers mention might be made of Sollogub and Gleb Uspenskii. As a satirical writer Soltykov (pseudonym *Shchedrin*, 1826-89) has no rival but Heine in the nineteenth century. Chernyshevskii's famous romance *Shto Delat?* (What is to be done?) has less literary worth than value as the gospel of the earlier Nihilists. Among the most recent writers are Garshin—a disciple of Tolstol—and the Little Russian Korolenko. The poets of the latter part of the nineteenth century have not equaled those of the earlier. The greatest of them was Nekrasov (1822-77), a champion of the poor and oppressed. Many of the most recent ones, however, without attaining the first rank, have written fine things. Among them are Khomiakov (1804-60), the Panslavist; Maikov (b. 1821), distinguished by the beautiful finish of his verse; Shershshin (pseudonym *Fef*, b. 1820), a singer of love and nature; the melancholy Polonskii (b. 1820); the peasant poet Nikitin (1824-61); Mei (1822-62); Stecherbina (1821-69); Plestchev (1825-93), etc. One of the most promising of the younger poets to-day is the Grand Duke Konstantin Konstantinovich, who writes over the signature K. R. In tragedy the

forces. After gaining a few successes in Armenia they were forced to retreat toward their own frontier. In the Balkan peninsula they divided their forces in Bulgaria, and though they gained possession of Nicopolis, Lovatz, and other places, garrisoned them by weak detachments, and allowed the approach of a Turkish army, 35,000 strong, under Osman Pasha, to escape their notice. In the first battle of Plevna (July 20) the Russians were defeated with considerable loss; in the second (July 30) they fared still worse, leaving a fifth of their number on the field. Gourko, who had led a Russian division beyond the Balkans, was forced to fall back upon Shipka Pass, where he was attacked by superior forces, and saved only by the timely arrival of re-enforcements. Russia now raised fresh troops and obtained aid from Roumania. After regaining Lovatz the allied Russians and Roumanians attacked Plevna, but though they succeeded in capturing one of the fortresses the attack on the inner line of defense was repulsed with enormous losses (Sept. 11-12). Public opinion laid the blame of these disasters upon the Russian headquarters, for both officers and men had acquitted themselves well on the field of battle. Todleben, the defender of Sebastopol, was now placed in control of the operations around Plevna. Cut off from all supplies, the Turks made a last desperate effort to break through the Russian lines on Dec. 10, but failed, and were forced to surrender. The victors crossed the Balkans, captured one Turkish army at Shipka, routed another on their way to Adrianople, and entered the latter city on Jan. 22, 1878. The Porte had already begun to negotiate for peace, and on Jan. 31 an armistice was granted by the Russians.

**Results of the War.**—Great Britain's dread of Russian designs on Constantinople led to the dispatch of a British fleet to that city, and brought the two nations to the verge of war. Nor were matters improved when the terms of the treaty of San Stefano (Mar. 3, 1878) between Russia and Turkey became known. By these, Bulgaria, with its territory enlarged so as to include the greater part of European Turkey, was to constitute an autonomous tributary principality, whose prince, elected by the people, was to be confirmed by the Porte. A Russian commissioner, holding office for two years, was to superintend the introduction of the new system, and a Russian army was to occupy the country for the same period. Improvements were to be introduced in the administration of Epirus, Thessaly, and the other parts of European Turkey for which the treaty did not provide a special constitution; also in Armenia, whose inhabitants were to be guaranteed security from Kurds and Circassians. In lieu of part of the war indemnity claimed by Russia she was to receive the districts of Kars, Ardahan, Batoum, and Bayazid in Asia, and the Dobrudscha in Europe, but the last-named district was to be ceded to Roumania in return for Bessarabia. Russia still claimed a balance of 3,000,000 rubles. A European congress was proposed, to be held in Berlin, but, to the chagrin of Great Britain, Russia denied the right of such a congress to decide finally upon the articles of the treaty. War seemed more imminent than ever, but at length Russia consented to certain modifications of the treaty, and the congress was opened on June 13. The work of the congress was embodied in the Treaty of Berlin (July 13), by which Bulgaria was limited to the country N. of the Balkans, the Russian commissioner was shorn of his powers, the portion of Bulgaria S. of the Balkans was formed into the autonomous province of Eastern Roumelia, subject to the direct authority of the sultan, and the Russian occupation was limited to nine months. Austria gained Bosnia and Herzegovina, and Turkey retained Bayazid. The powers recommended that Turkey should cede Thessaly and part of Epirus to Greece, a recommendation subsequently acted upon by the Porte. In other respects but slight changes were made in the provisions of the former treaty. See BERLIN CONGRESS and EASTERN QUESTION.

F. M. COLBY.

**Rustam, or Rustem,** rūstēm: a great hero in the mythical times of ancient Iran. He was the son of Zal and Rudābah, and his feats of gigantic prowess and prodigious strength play a romantic rôle in the great Persian epic, the *Shāh-Nāmāh*. (See FIRDŪSĪ.) The *haft khān*, or seven labors of Rustam, rival those of Hercules. The sad story of his slaying his own son Sohrāb, in single combat, forms one of the most pathetic episodes in the *Shāh-Nāmāh*, and has parallels in other literatures; for example, in the old Germanic story of Hildebrand and Hadubrand and in the Celtic tale of Cucullin and Conloch. A. V. WILLIAMS JACKSON.

**Rustchuk, roost-chook':** town of Bulgaria, on the Danube; 40 miles by rail S. by W. of Bucharest (see map of Turkey, ref. 3-D); the northwestern corner of the Bulgarian quadrilateral. (See QUADRILATERAL.) It has played an important part in the wars between Russia and the Ottoman empire. Captured by the Russians in 1810, it was held by them till 1812. The fortifications then destroyed were rapidly rebuilt, but razed to the ground again in 1829 in accordance with the Treaty of Adrianople. They were once more erected in 1853. Rustchuk escaped capture in the Russo-Turkish war of 1877. Since the creation of the semi-independent principality of Bulgaria, the city has rapidly improved in appearance and business activity has developed. Pop. (1893) 28,121. E. A. GROSVENOR.

**Rüstow, rüstō, WILHELM:** soldier and writer on military subjects; b. at Brandenburg, Prussia, May 25, 1821; entered the Prussian army in 1838; was arrested and indicted in 1850 for his *Der Deutsche Militärstaat vor und während der Revolution* (1850), but escaped; settled at Zurich; became a celebrated military author; found practical employment in the Swiss army, and took part with distinction in the campaigns of Garibaldi in Sicily and Naples in 1860. Besides his *Geschichte des Griechischen Kriegswesens* (1852; supp. 1854-55) and *Heerwesen und Kriegführung Julius Cäsars* (1855), he published critical representations of all the recent European wars, and a number of theoretical works on tactics, strategy, elementary military organization and education: *Die Feldherrnkunst des 19ten Jahrhunderts* (Zurich, 1857; 3d ed. 1877); *Geschichte der Infanterie* (2 vols., Gotha, 1857-58; 3d ed. Leipzig, 1884); *Allgemeine Taktik* (Zurich, 1858); *Militärisches Handwörterbuch* (2 vols., Zurich, 1859); *Strategie und Taktik der neuesten Zeit* (3 vols., 1872-75). D. at Zurich, Aug. 14, 1878.

**Rusts:** the popular name for various parasitic fungi, especially for those which produce reddish or brownish discolorations upon the plants which they attack. Botanists are inclined to restrict the term to the UREDINEÆ (*q. v.*), which include the rusts of wheat and other cereals, besides many species attacking other plants of little or no economic importance. One of the species affecting wheat is the *Puccinia graminis* (Fig. 1), whose first stage develops in the

FIG. 1.—Wheat-rust: a, first stage, on barberry; b, second stage, red rust, on wheat (highly magnified).

leaves of the barberry, where it forms many bead-like rows of spores (*conidia*) in masses which are at first internal, but eventually burst through the epidermis in the form of minute cups (Fig. 1, a). The yellow spores of this "cluster-cup" stage germinate upon and penetrate the leaves of the wheat, where the threads of the parasite produce clusters of reddish-yellow spores (Fig. 1, b), which burst through the epidermis in elongated patches. This is the "red-rust" stage, so common when the wheat is about full-grown. The red-rust spores (called *uredospores*, or *stylospores*) serve to propagate the fungus still further; each one falling upon a wheat leaf and finding sufficient moisture germinates, and penetrates the epidermis, giving rise to another growth of parasitic threads, and another mass of red-rust spores. Somewhat later, the fungus forms small, dark-colored sporesacs, each containing two relatively large spores (Fig. 2), which burst through the epidermis as elongated black patches. These spores (black-rust spores, or teleutospores) being thick-walled, are capable of remaining on the straw without injury during the winter, and in the following spring germinate in the moisture of the rotting straw, each spore forming a short thread upon which are borne a few very minute spores (*sporidia*). When the latter fall upon a

CHARLES R. HENRY.

**Rutabaga**: the Swedish turnip, a highly important root crop, believed to be an artificial variety of *Brassica campestris*. It has nearly sub-varietal forms, some of which are among the most valued of the turnips. See TURNIP.

**Rutaceae** (Mod. Lat., named from *Ruta*, one of the genera from *eu* for real), a family of dicotyledonous trees, shrubs, and herbs. Rue, in haw, and the pinkish ash (*Nyctaglyphis*) are representative plants. Rutaceae have recently attached the *Simarubaceae* (orange, lemon, citron, etc.) to this family, which numbers nearly 600 species.

Revised by CHARLES R. HENRY.

**Ruteboul**, 1816-1881: one of the most original French poets of the nineteenth century. Little is known about his life except that he was a poor poetical, lived at Paris, was twice married, made but a precarious living, kept bad company, and died about 1881. His *Morceaux de Talchabais*, his *Les Vers de Sonnet*, and his *Chansons de l'ancien* are rather perfunctory, perfunctories, but in his lyric poems and *Ballades* he shows great sincerity, power of beautiful description, and keen satire, especially against the clergy. Johnson has given an edition of his *Œuvres* (3 vols., Paris, 1874-75); see also L. Chénier, *Ruteboul* (Paris, 1891).

A. G. CAMPBELL.

**Rutgers**, Henry: soldier and philanthropist; b. in New York, Oct. 1, 1745; graduated at Columbia College (1766); was a captain during the war of the Revolution, and subsequently a colonel of militia. He was a wealthy citizen of New York, a prominent member of the Reformed Dutch Church, and an active politician; was several times a member of the New York Assembly and a regent of the University of New York from 1802 to 1826. D. in New York, Feb. 17, 1820. Rutgers originally founded Rutgers College and his name in consequence of a donation of \$5,000, and several important charities in New York were recipients of his bounty.

**Rutgers College**: an institution at New Brunswick, N. J. In 1766 Gov. William Franklin of New Jersey granted a charter for a college to be called Queen's College, which was to be primarily an institution for the education of young men for the ministry in the Reformed Dutch denomination, and secondarily to instruct all who might resort to it in all the branches of a collegiate education. An amended charter was granted in 1779, under which the college went into active operation. The first president was the Rev. Jacob R. Hardenbergh, D. D. His successors have been: Rev. John H. Livingston, D. D., Rev. Philip Muller, D. D., Rev. A. Bruyn Haskinck, M. D., Rev. Theodore Frelinghuysen, M. D., Rev. William B. Campbell, D. D., L. L. D., Merrill F. Gates, Ph. D., L. L. D., Austin Scott, Ph. D., L. L. D. The president is required by the charter to be a member of the Reformed (Dutch) Church in America, but no restriction religious instruction is given, and students of all denominations have always been found in this college. Its history for a long time is that of a struggle with various difficulties, especially per-

erty, and for a time its exercises were suspended. In 1825 it was revived under the name of Rutgers, in honor of its benefactor, Col. Henry Rutgers, of New York. Since then its work has been carried on uninterruptedly and successfully, its resources and facilities having been greatly increased. In 1863 Rutgers Scientific School was organized, and in 1864 was designated by the State as the New Jersey State College "for the benefit of agriculture and the mechanic arts," with which, as a department, the college experiment station is connected. In 1894-95 the number of students in the classical and scientific departments was 237, and of professors and instructors 30.

AUSTIN SCOTT.

**Ruth, Book of** [*Ruth* is from Heb., liter., appearance, beauty]: a canonical book of the Old Testament. It is a beautiful pastoral story, relating the love of Ruth, a young Moabitess, the widow of a Hebrew, for her mother-in-law, Naomi, and the subsequent marriage of Ruth to Boaz, a rich husbandman of Bethlehem-Judah. It is a picture of domestic virtue and happiness amid the troubled times of the Judges, when might was right. Ruth was the great-grandmother of King David. The date and authorship of the book must be inferred solely from its contents and from its position in the canon. It has an Aramaic tinge, and in the Hebrew Bibles is classified as one of the five little rolls of the Hagiographa; and from these facts some have inferred its post-exilic origin. English Bibles, however, following the Septuagint, place it as one of the five consecutive stories of the times of the Judges (Jud. xiii. 2-xvi.; xvii.-xviii.; xix.-xxi.; Ruth; 1. Sam. i.-iv. 1, first clause), and such testimony as that of Josephus and Origen shows that this is the more ancient classification. There is no reason for dating any of these stories later than the reign of David. David's conquests over Damascus-Syria and other Aramaean peoples doubtless had an Aramaizing effect in Israel, equally with the later events of the times of the exile. See Stephen H. Tyng, *The Rich Kinsman* (1856); C. H. H. Wright, *The Book of Ruth in Hebrew and Chaldean* (London, 1864); R. W. Bush, *Popular Introduction to the Book of Ruth* (London, 1883); Paulus Cassel in the *Schaff-Lange Commentary*; James Morison in the *Pulpit Commentary*; J. Glentworth Butler's *Bible Work*, vol. iii., 1889. Goethe pronounces the book of Ruth "the loveliest thing in the shape of an epic or idyl which has come down to us."

Revised by W. J. BEECHER.

**Ruthenian Rite:** a branch of the Roman Catholic Church, consisting of the United Greeks of Austria, Hungary, and Poland, who, as a rule, speak the Russniak language, a Slavic tongue resembling the Polish. They have in Austria an archbishopric (Lemberg, with two united sees of Sanok and Sambor) and two bishoprics (Przemysl and Stanislawów). Their number is 2,653,567. They have 2,376 priests, who care for 1,535 parishes. In 1830, by an act of fraud and violence, the Ruthenians dwelling on the soil of Russian Poland were separated from the Roman Church. See EASTERN RITE, and *Annales Ecclesiae Ruthenae*, etc., Leopoli (1862); Pelesz, *Geschichte der Union der ruthenischen Kirche mit Rom von den ältesten Zeiten* (1881); Jordan, *Schematismus der gesammten Katholischen Kirche Oesterreich-Ungarns* (1887); Werner, S. J., *Orbis Terrarum Catholicus* (Freiburg, 1890).

J. J. KEANE.

**Ruthenians, or Russniaks**, sometimes called **Red Russians**: the Russian inhabitants of Austria-Hungary, some 3,500,000 in number, who are usually classed with the Little Russians, from whom they are distinguished by a few slight differences of dialect. Most of them are found in Western Galicia and the Bukovina, but about 400,000 are settled on the other side of the Carpathians, in Northern Hungary. Owing to their long subjection to Poland they are chiefly a nation of peasants, as the aristocracy is Polish or Polonized. They are intelligent, quiet, and peaceful, but backward in civilization, poor, and addicted to drunkenness. The centuries of political and religious subjection that they underwent at the hands of their masters have engendered bitter hatreds, which have shown themselves by cruel massacres of the nobles during Polish revolts in the nineteenth century. Despite their numbers they have succeeded in electing but few members to the Austrian Reichsrath, though they are beginning to gain ground. As a rule they belong to the United Greek Church, but their political sympathies are apt to be with their brethren in Russia. Their literature, like the Little Russian, of which it forms a part, is particularly rich in folk-lore and songs. For specimens see Vaclav, *Piesni Polski i Ruskie* (1833). They translated

the Bible in 1581. They have a theater and several schools and newspapers. Those in Hungary have made less progress, owing to the crushing policy of Magyarization of the Government at Budapest. A German grammar of the language was published by Levicki in 1833, and a catalogue of Ruthenian literature by Kotula (Lemberg, 1878). See also Biedermann, *Die ungarischen Ruthenen* (2 vols., Innsbruck, 1861-68); Szujski, *Die Polen und Ruthenen in Galizien* (Teschen, 1882); Kupezanko, *Die Schicksale der Ruthenen* (Leipzig, 1887). See RUSSIAN LANGUAGE.

A. C. COOLIDGE.

**Ruthenium** [Mod. Lat., named from Ruthenia, a name of Russia, where it was first found]: a metal discovered in association with native platinum by Claus in 1846. It occurs chiefly in the hard grains of iridosmine in small proportion, not above 6 per cent. Its extraction is difficult and tedious. The metal is obtained as a white spongy mass, density 8.6, by calcining the ammonio-chloride. Next to osmium it is the most infusible known metal, but Deville and Debray fused it, and found a density of 11.4. It is scarcely attacked by aqua regia, but easily oxidized by fusion with hydrate of potash, more easily with saltpeter. Chlorine attacks it at incandescence. It forms three chlorides,  $RuCl_3$ ,  $RuCl_4$ , and  $RuCl_5$ ; six oxides,  $RuO$ ,  $Ru_2O_3$ ,  $RuO_2$ ,  $Ru_3O_4$ ,  $Ru_2O_5$ , and  $RuO_4$ ; and two sulphides,  $Ru_2S_3$  and  $RuS_2$ . Its fumes are not poisonous.

Revised by ISA REMSEN.

**Rutherford**: borough; Bergen co., N. J.; near the Passaic river, on the N. Y., Lake Erie and W. Railroad; 7 miles S. E. of Paterson, 8 miles N. by W. of Jersey City (for location, see map of New Jersey, ref. 2-E). It is an attractive residential place, built up chiefly by New York business men, and contains several churches, public schools, school-district library, and three weekly newspapers. Pop. (1880) 2,299; (1900) 2,293.

**Rutherford, SAMUEL**: theologian and controversialist; b. at Nisbet, Roxburghshire, Scotland, about 1600; graduated M. A. from the University of Edinburgh 1621; became minister of Anwoth 1627; was deprived by the high commission court of Galloway 1630, and silenced for preaching against the Articles of Perth and banished to Aberdeen 1636; was restored to Anwoth in 1638; was a delegate to the General Assembly Nov., 1638; Professor of Divinity in New College, St. Andrews, Oct., 1639; principal of that college 1647, and rector of the university; was commissioner to the Westminster Assembly 1643-47, but was deprived of his posts 1660, and cited to appear before the next Parliament on the charge of high treason. During the four years of his service on the commission he wrote *The Due Right of Presbyteries* (1644); *Lex Rex* (1645), which was burned under his windows at St. Andrews in 1661; *The Trial and Triumph of Faith* (1645); and *Christ Dying and Drawing Sinners to Himself* (1647). D. in Edinburgh, Mar. 29, 1661. He was prominent among the Presbyterian divines of his time, and author of a large number of theological treatises, which were highly esteemed; among them were a reply to Rev. Thomas Hooker's *Summe of Church Discipline; Covenant of Life* (1655); *Civil Policy* (1657); *Life of Grace* (1659), etc. There have been reissued *Twelve Communion Sermons* (1876) and *Quaint Sermons* (edited by A. A. Bonar, 1885). See A. A. Bonar, *Letters of Rev. Samuel Rutherford*, with a sketch of his life (1851; new and revised ed. London, 1894; another ed. of his *Letters* (New York, 1891), and the *Life* by Andrew Thomson (London, 1884; 2d ed. 1891).

Revised by S. M. JACKSON.

**Rutherford, LEWIS MORRIS**: astronomer; b. at Morrisania, N. Y., Nov. 25, 1816; graduated at Williams College in 1834; admitted to the bar in 1837; retired from practice in 1849 to devote himself to travel and study, especially of astronomy. He was the first to apply photography to accurate celestial measurements. In 1864 he had a large telescope especially constructed for photographic purposes, and his pictures of celestial objects taken with this instrument have not yet been surpassed. In 1883 he retired from active astronomical work, and presented his instruments to Columbia College. D. at Tranquillity, N. J., May 30, 1892.

S. NEWCOMB.

**Rutherglen**, rū'g'lēn: town of Lanarkshire, Scotland; on the Clyde, 3 miles S. E. of Glasgow (see map of Scotland, ref. 12-G). It was formerly a place of great importance, but is now dependent on its connections with Glasgow for both its trade and its manufactures. Pop. (1891) 13,361.

**Rutile** [from Lat. *ru'tilus*, red, golden red]: a native oxide of titanium used to color porcelains and artificial teeth

rine piratical squadron off the port of Salé, and subsequently distinguished himself still more in the war between Holland and England, 1652, and in the Danish service. In 1667 he sailed up the Thames, destroyed the shipping at Sheerness, and burned a number of English men-of-war; in 1672 he attacked the English and French fleets, and compelled England to conclude the Peace of Breda. In the war with France he commanded in the Mediterranean, but was defeated off the eastern coast of Sicily by Admiral du Quesne. He succeeded in conducting his fleet safely into the harbor of Syracuse, where he died next day, Apr. 29, 1676.

**Ryan, HARRIS JOSEPH, M. E.:** electrical engineer; b. at Powell's Valley, Pa., Jan. 8, 1866; educated at Baltimore City College, Lebanon Valley College, and Cornell University, graduating at the last named in 1887; instructor in physics, Cornell University, 1888-89; appointed Associate professor of Electrical Engineering, Cornell University, 1889. Prof. Ryan is the author of various papers on electrical machinery read before the American Institute of Electrical Engineers, of which he is a member, and is a contributor to *The Electrical World*, *The Electrical Engineer*, *The Sibley Journal of Engineering*, and numerous other U. S. and European electrical journals. C. H. T.

**Ryan, STEPHEN VINCENT, D. D.:** bishop; b. near Almonet, Upper Canada, Jan. 1, 1825; was taken when a child to Pennsylvania; was educated at St. Charles's Seminary, Philadelphia, Pa.; completed his theological studies at St. Mary's Seminary, Barrons, Mo.; was ordained priest June 24, 1849, in St. Louis, Mo.; was prefect and professor for some years at St. Mary's Seminary, and afterward at St. Vincent's College, Cape Girardeau, Mo., of which institution he became president about the year 1856; was named provincial visitor of the Congregation of the Mission in 1857; appointed by the Holy See second Bishop of Buffalo Mar. 3, 1868, and was consecrated Nov. 8 of the same year. Revised by J. J. KEANE.

**Ryazan:** See RIAZAN.

**Rybinsk':** town of Russia, government of Yaroslav; on the Volga; 48 miles N. W. of Yaroslav (see map of Russia, ref. 6-E). It is one of the most important centers of internal commerce in the empire, and is at the head of the Mariinskaia and Tikhvinskala Canals which unite the basins of the Volga and the Neva and Dwina, and thus the Caspian with the Baltic. It has a large transit trade in cereals, flax and hemp and their seeds, lard, spirits, metals, cloths, and other manufactures, and the Volga is open on an average 219 days per year. The town is an ancient one, first mentioned in history in 1137; became important in the middle of the eighteenth century, when the canals were finished. Pop. (1890) 32,111. MARK W. HARRINGTON.

**Rydberg, rid'bärch, ABRAHAM VICTOR:** author; b. at Jönköping, Sweden, Dec. 18, 1829; educated in the Latin school of Wexiö, studied at the University of Lund, and was for many years editor of *Göteborgs Handels- och Sjöfartstidning*, one of the most influential papers of Scandinavia. He has published several translations (Goethe's *Faust*) and novels, among which *Den siste Athenaren* (The Last of the Athenians, 1859), a picture of the last contests between Greek paganism and Christianity, was translated into German and English; several poems characterized by finish and originality; a number of æsthetical and historical studies, *Venus från Milo* (1874), *Romerska dagar* (1875-77), etc.; and a series of works belonging to the philosophy of religion—*Bibels lära om Kristus* (The Teaching of the Bible about Christ, 1862), *Medeltidens magi* (Magic of the Middle Ages, 1864), *Romerska sagnar om Apostlarin Paulus och Petrus* (Romish Legends about the Apostles Peter and Paul, 1871), *Urpatriarkernas tafla i Genesis* (The Primitive Patriarchs' Tables in Genesis, 1873), etc. His *Undersökningar i germanisk Mythologi* (1886; Eng. trans. 1889, under the title *Teutonic Mythology*) is a brilliant but wholly unscientific work. Revised by D. K. DOBUE.

**Ryde:** town of England; on the northeast coast of the Isle of Wight, opposite Portsmouth, at the other side of the Spithead roadstead (see map of England, ref. 14-1). It is a fashionable watering-place; it consists of Upper and Lower Ryde—the former being on the site of an ancient village (La Rye or La Riche), while the latter is of recent construction. Pop. (1891) 10,952.

**Rydqvist, rid'kwist, JOHAN ERIK:** scholar; b. at Gothenburg, Sweden, Oct. 20, 1800; was editor of a literary journal,

*Heimdal* (1828-32); became a royal librarian; was elected a member of the Swedish Academy. His *Svenska språket* (*Principles of the Swedish Language*, 5 vols., 1850-74) is still, in spite of the many changes in linguistics, the authoritative work on that subject. He was also the author of a study of the early Scandinavian drama *Nordens äldsta skådespel*, and the translator of a number of Moore's poems. D. at Stockholm, 1878. D. K. DOBUE.

**Rye:** a cereal plant (*Secale cereale*), native of the country about the Caspian Sea. It is largely cultivated in Central and Northern Europe, where the grain is the chief breadstuff and the straw is largely used for thatching. Rye grows well in a cold climate, and will thrive on poor sandy soils better than wheat. Rye is not so nutritious as wheat, and makes an inferior and darker-colored bread. An average analysis of rye grown in the U. S. gives: Water, 11.6; ash, 1.9; protein, 10.6; fiber, 1.7; carbohydrates, 72.5; fat, 1.7. Fertilizer analyses give for grain a percentage of 1.76 nitrogen, 0.82 phosphoric acid, 0.54 potash; and for straw a percentage of 3.25 ash, 0.46 nitrogen, 0.28 phosphoric acid, 0.79 potash.

In the U. S. about 80,000,000 bush. are produced annually. In the eastern States the straw is often of as much value as the grain. Machinery has been devised for threshing the grain without breaking the straw, which is used largely for matting, mattresses, and saddlery. Whisky is extensively distilled from rye in the U. S., gin in Holland, and a liquor called kvass in Russia. GEORGE C. WATSON.

**Rye-grass:** the *Lolium perenne*, a European grass naturalized in the U. S. In Europe it is highly esteemed both for hay and pasture, and is the most important of all forage plants, but in the U. S. it is not very highly valued. The Italian rye-grass (*L. italicum*) is also greatly valued in Great Britain. For the *Lolium temulentum* see DARNEL.

**Rye House Plot:** a scheme devised by some English Whigs to kill King Charles II. while on his way from Newmarket, and to give the crown to the Duke of Monmouth. It was so called from the Rye House, a farm near Newmarket, where the murder of the king was to be undertaken. The plot was discovered, and many leading Whigs, including Algernon Sydney and Lord Russell, were sent to the block, and many others were severely punished.

**Rye, Spurred:** See ERGOT.

**Ryleev, ril-ä'yef, KONDRATIY FEDOROVICH:** poet; b. in Russia, Sept. 18, 1796, the son of a retired officer. He was brought up in the first corps of cadets, was in the artillery during the campaign of 1814, and withdrew from the army four years later. In St. Petersburg, where he took up his residence, he served as a Government official and then as secretary of the Russian American Company. At the same time he was active in literature and politics. He published poems in different papers, and with his friend A. Bestuzhev was editor of the *Severnaya Zvezda* (North Star), an organ of the romantic school. He was one of the chiefs of the band of conspirators who brought about the futile military rising at the accession of the Emperor Nicholas I., although convinced that success was impossible, and was hanged with four of his comrades July 26, 1826. His character seems to have been exceedingly pure, and his patriotism of the highest kind. His complete works were published at St. Petersburg, 1872. See *The Poems of K. F. Rylaiev*, translated by F. Hart-Davies (London, 1887). A. C. COOLIDGE.

**Rymer, or Rymour, THOMAS:** historiographer; b. at Northallerton, Yorkshire, England, about 1641; educated at Sidney-Sussex College, Cambridge; studied law at Gray's Inn; became historiographer to William III. in 1692; now chiefly remembered for the vast Latin collection of English historical and diplomatic documents known as *Rymer's Fædera* (20 vols. folio, 1704-35, of which 15 were edited by himself and the remainder by Robert Sanderson). D. in London, Dec. 14, 1713. Rymer left 58 MS. vols. of important historical documents, now in the British Museum. A *Syllabus* (in English) of the *Fædera* was published by Sir Thomas Duffus Hardy (3 vols., 1869-86).

**Rymour, THOMAS:** See RHYMER, THOMAS.

**Ryswick, riz'wik:** small town of the Netherlands, province of South Holland; 2 miles S. E. of The Hague (see map of Holland and Belgium, ref. 6-E). It is famous for the treaty of peace between France and the allies, Germany, Holland, England, and Spain, signed here Sept. 20, 1697.

**Rzhef:** See RSHEF.

years according to Herodotus, ii., 137). His reign in Egypt was mild, and he left monumental remains in Thebes. Hoshea of Israel (2 Kings xvii. 4) asked his aid against Shalmaneser of Assyria in vain, and later other Syrian princes made alliance with him against Assyria. Sargon, who defeated Sabaka at Raphia, S. of Gaza, and afterward exacted tribute of him, calls him a "prince," and his cartouche, found at Nineveh, shows him wearing the crown of Lower Egypt. Stade considers him to have been simply a petty local ruler.

CHARLES R. GILLET.

**Sabal Palmetto:** See PALMETTO.

**Sabanilla, sãa-bãa-neel'yãa, or Savanilla:** seaport of the department of Bolivar, Colombia; on a bay 7 miles W. of the delta of the river Magdalena (see map of South America, ref. 1-B). It is connected by railway with Barranquilla, on the river, and is the maritime port of that place, and consequently of the greater part of the republic. The bay is shallow, and vessels anchor in a roadstead several miles below. The population is small.

H. H. S.

**Sabbath** [from Heb. *shabbâth*, rest, sabbath, deriv. of *shabâth*, rest from labor]: the weekly day of religious rest. The observance of a weekly rest-day is very widely held to have a natural basis in the constitution of man. The persistency with which such an institution has been maintained for many ages among Jews, Christians, Mohammedans, and even some pagan nations, supports this view. Inquiries instituted by a commission of the British Parliament in 1832, the testimony of 641 medical men of London in a petition to Parliament in 1853, and of a great number of medical societies, physicians, physiologists, political economists, and managers of industrial establishments, go to prove that in the case of men engaged in ordinary bodily or mental labor the rest of the night does not fully restore the waste of energies during the day, and that to maintain a condition of vigor a supplementary rest of about one day in seven is needed. This view is confirmed by the experience of France during the Revolution, when the decade was substituted for the week, and each tenth day devoted to rest—a proportion of time which was found to be insufficient. The need of a weekly respite from daily toil appears also in the social nature and relations of man as a member of the family and of the state. These aspects of the weekly rest have been ably illustrated by Pierre Proudhon, the French radical philosopher, in his essay *La Célébration du Dimanche*, and more fully in papers presented at the Sunday Rest Congress in connection with the Paris Exposition of 1889; and in papers read at the Chicago Sunday Rest Congress in 1893, published as *The Sunday Problem* (New York, 1894).

The week of seven days may be traced to the dawn of human history, and it is probable that wherever the week existed it was marked by the observance of sabbath or rest-days. A weekly Sabbath was known to the Semitic Assyrians and Babylonians, and it is claimed that the name *Sabattu* is found in the inscriptions, where it is defined as "a day of rest for the heart." It seems also to have been known to the Accado-Sumerians, the aboriginal inhabitants of Chaldaea, and their equivalent term for Sabbath is explained to mean "a day of completion of labor." (Sayce, *Hibbert Lectures for 1887 and Social Life among the Assyrians*, 1893.) The Assyrian Sabbath differed widely from that of the Hebrews, and the connection between the two is as yet uncertain. See Francis Brown's *Assyriology* and J. D. Davis's *Genesis and Semitic Tradition*.

The first mention in the Bible of such an institution is in Gen. ii. 2, 3—a passage which forms the close of the earliest of the records of which the Mosaic history, according to the theory of many biblical scholars, is composed. The seventh day is consecrated by the Creator, who, having finished the creative work of six days, or periods, blessed and hallowed the seventh because he rested therein. The natural meaning of the passage is the establishment of a holy rest-day after every six days of labor for the race just created. The natural law of periodic rest was thus lifted out of the sphere of mere physical necessities into that of intellectual and spiritual privilege and enjoyment, as befitting a creature made in the image of the Creator and capable of holding fellowship with him. Its connection with the Creation shows that, with the family constitution, it was intended to lie at the basis of the development of all human life, inclusive of all human conditions, and not merely for any sect or age. As to the observance of the Sabbath in the patriarchal period, the Mosaic narrative, which is very brief and meager, gives us no knowledge save what may be inferred

from the occasional intimations of the division of time by weeks (Gen. xxix. 27; viii. 10, 12; iv. 10, etc.).

The first mention of the Sabbath by name occurs in Ex. xvi. 23, *seq.*, where its observance is not introduced with the formalities with which an institution of such importance would be inaugurated for the first time, but in language which seems to imply that it was not wholly unknown to the people. It next appears among the Ten Commandments, which were distinguished from the rest of the Jewish law by the circumstances of peculiar solemnity under which they were spoken on Mt. Sinai and given to Moses engraved on stone tablets by the hand of God (Ex. xx. 8). Its observance was enforced by gratitude for deliverance from bondage (Deut. v. 15), and was constituted a sign of covenant between God and the Jews. Like other of these great commands, the law of the Sabbath reappears in the Jewish municipal and ceremonial code with special prescriptions and penalties, all of which show the importance attached to its observance and the great care taken—as by the prohibition of servile work, gathering of sticks, kindling fires, etc.—that all alike, servants as well as masters, strangers as well as members of the congregation, should enjoy its benefits. A single instance is recorded of the punishment of death being inflicted upon a presumptuous transgressor (Num. xv. 30, *seq.*). Connected with the weekly Sabbath there was ordained in the Jewish municipal and ceremonial law a system of sabbatical years of local and national significance and use (Lev. xxv.). The Sabbath also, in its leisure and opportunity for social intercourse and holy convocation (Lev. xxiii. 3), sustained an important relation to the free republican institutions of the Jews. In later periods of the Jewish history, Isaiah (lviii. 13) and Jeremiah (xvii. 21, *seq.*) enforced its observance with threatenings and promises; Ezekiel (xx. 12, *seq.*) put its violation foremost among the national sins; Nehemiah (x. 31; xiii. 15) narrates the public efforts at reformation after the return from the Babylonish captivity. Henceforward the Sabbath was kept with scrupulous care, and gradually to the time of Christ became burdened with self-enforced severities and ridiculous prohibitions.

Christ, while observing the Sabbath, sought by his example and teachings to rescue it from the puerile superstitions by which it had come to be degraded. He performed miracles of healing, and with his disciples gathered ears of grain for food as he passed through the fields on the Sabbath, and justified his conduct by showing that such works of necessity and mercy were not violations of its true law. He taught that the Sabbath was made for man, for his benefit, and not man for the Sabbath, and that He, the Son of man, the one in whom all humanity is represented in its perfection, was so the Lord of the Sabbath as rightfully to define and prescribe its true obligation and use (Mark ii. 27, 28).

The resurrection of Christ and his subsequent appearances to his disciples till his ascension, and the miraculous descent of the Holy Spirit on the first day of the week, led to that day being set apart for the special religious assemblies of the Christians and for the simple services of their faith. For a time the Jewish converts observed both the seventh day, to which the name Sabbath continued to be given exclusively, and the first day, which came to be called the Lord's Day. St. Paul sought to relieve the consciences of the Gentile Christians from the obligation of keeping the Jewish Sabbath, and warned them that such observance might even be an evidence of backsliding (Col. ii. 16; Gal. iv. 10). Within a century after the death of the last of the apostles we find the observance of the first day of the week, under the name of the Lord's Day, established as a universal custom of the Church, according to the testimony of the *Didache*, and of Barnabas, Ignatius, Pliny, Justin Martyr, and Tertullian. It was regarded not as a continuation of the Jewish Sabbath—which was denounced, together with circumcision and other Jewish and anti-Christian practices (*Apology of Aristides*, A. D. 125)—but rather as a substitute for it; and naturally its observance was based on the resurrection of Christ rather than on the Creation rest-day or the Sabbath of the Decalogue. Tertullian (about 200), in saying that Sunday was given to joy, and enjoining abstinence from secular care and labor on it, makes it evident that the Lord's Day was regarded as taking the true place of the original seventh-day Sabbath. But the position of the early Church, struggling into existence, exposed to persecution, and with many of its members slaves of heathen masters, would prevent unbroken regularity of worship and a general cessation of labor, until in the time of

Sábians mentioned in the Koran. They even asserted that they were descendants of one Sábî, son of Seth or Adam. See Chwoson, *Die Ssabier* (St. Petersburg, 1856); Wellhausen, *Skizzen*, iii., p. 206; Dozy, *Nouveaux documents pour l'étude de la religion des Harraniens in Actes du sixième congrès des Orientalistes* (Leyden, 1885, ii., 1, p. 281).

RICHARD GOTTHEIL.

**Sable** [from O. Fr. *sable*; cf. Fr. *zibeline*, *soble*, Ital. *zibellino*, Germ. *zobel*; loan-word from Russ. *sobol'*]: a name given to species of the family *Mustelidæ* and genus *Mustela*. The animals in external appearance resemble the weasel, but they are considerably larger and their bodies are not so elongated. In summer the color is reddish or brownish yellow, clouded with black, and becoming lighter toward the head; in winter it is dark. The length of the body in well-grown sables does not vary much from 17 inches from the snout to the tail, while the tail is from 7 to 10 inches long. The Old World form (*Mustela zibellina*) inhabits Northern Europe and Asia. The sable furs are chiefly obtained in Siberia. This Siberian form in winter often has the whole body covered with lustrous blackish-brown or sometimes quite black hairs, but with these are generally intermingled white ones. The posterior tubercular grinder of the upper jaw is oblong, and nearly twice as long on the inner as on the outer side. The American sable (*Mustela americana*) is most abundant in British America, and the furs in the markets are chiefly obtained by the Hudson Bay Company. It is distinguished from the Siberian species by the posterior tubercular grinder of the upper jaw being quadrate, and rather longer on the inner than on the outer side. The furs of both species are held in high esteem.

Revised by F. A. LUCAS.

**Sable, Cape**: See CAPE SABLE.

**Sable Island** [Fr. *sable*, sand]: an island 104 miles S. E. of Cape Canso, in Nova Scotia. It is a dependency of Nova Scotia, and is an arc 34 miles long, convex to the S., and from 1½ to 5 miles in breadth. It is composed of grass-covered sand-hills, inclosing a lake 11 miles long with a maximum depth of 12 feet. Lat. of east point, 43° 59' N., lon. 59° 47' W.; lat. of west point, 43° 57' N., lon. 60° 8' W. Many ponies are bred here. The island has a life-saving station, it being surrounded by extensive and very dangerous shoals. It is in the regular course of ships from Europe to Southern Nova Scotia and New Brunswick. It is said to be slowly growing smaller. It was colonized in 1598 by forty French convicts, but five years later only twelve survived, and the colony was broken up. The island should not be confounded with Cape Sable island. See CAPE SABLE.

Revised by M. W. HARRINGTON.

**Sables, or Les Sables d'Olonne**, lā'saab'l'dō'lōn': town; in the department of Vendée, France; on the Bay of Biscay; 50 miles S. by W. of Nantes (see map of France, ref. 5-C). It was founded by Louis XI., who built its harbor and constructed its fortifications. It is a favorite watering-place, and carries on extensive fisheries and a large export trade in grain, wine, wood, salt, and fish. Pop. (1891) 10,293.

**Sabri'na**: a celebrated temporary volcanic islet of the Azores, a short distance S. W. of Cape Ferraria, the western point of San Miguel island. It appeared in 1811, and the process was watched by the crew of the British frigate Sabrina, from which its name is derived. Sixteen days after the eruption the cone attained its greatest dimensions—215 feet in height and 6,000 in circumference. It was composed of ashes and scoria without cohesion, and was gradually washed away until in 1850 the lead showed a depth of 15 fathoms where it had formerly stood.

M. W. H.

**Sacaline**: a forage plant (*Polygonum sachalinense*) from the island of Saghalin, on the Russian shore of the Pacific, introduced in the U. S. in 1894. It is a perennial woody herb, growing 6 to 12 feet high. It is said to be relished by live stock, and the shoots and leaves are recommended as a kitchen vegetable. The plant is supposed to resist severe drouth.

L. H. B.

**Saccar'do**, PIETRO ANDREA, Ph. D.: botanist; b. at Treviso, Italy, Apr. 23, 1845; Professor of Botany in the University of Padua, and author of many works on the fungi, the most important of which are *Fungi Italici* (1877-86) and the *Sylloge Fungorum Omnium huc usque Cognitorum* (10 vols., 1882-92), containing descriptions of 39,663 species. He has made a distribution of specimens under the title of *Mycotheca Veneta*.

C. E. B.

**Saccas**: See AMMONIUS.

**Saccharim'etry** [Lat. *saccharum*, sugar + Gr. μέτρον, measure]: the process of ascertaining the proportion of sugar dissolved in a liquid. This can be effected by using the hydrometers of Brix or Balling, sometimes called saccharimeters, which are specially constructed so as to indicate the percentage of sugar in an aqueous solution. (See HYDROMETER.) But the means generally adopted is by utilizing the optical properties of sugar. All sugars and their solutions have the power of rotating the plane of polarization of light; some, such as cane-sugar and grape-sugar, rotate the plane to the right, while lævulose rotates the plane to the left. (See OPTICS and POLARIZATION.) If  $\theta$  is the angle of rotation,  $l$  the length of solution traversed, and  $p$  the number of units of weight of dry sugar present in a certain volume of solution,  $\theta = lpa$ , where  $a$  is positive or negative according to the species of sugar, and has a determinate value for a given temperature. The latter quantity, which is the angle of rotation for  $l = 1$ ,  $p = 1$ , is called the specific rotatory power. Hence  $l$  being assigned, and  $\theta$  and  $a$  being obtained by experiment, the value of  $p$ , giving the percentage of sugar, is calculated. The experiments are carried out by means of a saccharimeter, an instrument of which there is a considerable number of varieties. These are divided into two classes. One measures the angle of rotation directly, while the other determines the rotation by the contrary rotation caused by a thin plate of quartz. The latter are called shadow saccharimeters, from the principle involved. The original instrument of this kind was due to Prof. Jellet, of Dublin, but it has been greatly improved upon by Duboseq and Cornu. Another somewhat different form, devised by Laurent, has been adopted by the French Government. The distinguishing feature is that for certain positions of the optical parts of the instrument the field, one half of which is covered with a half-wave plate of quartz or mica, appears divided into two half disks, one bright and the other dark, and in another position as a uniform shadow without a dividing line. In the latter case the instrument is adjusted for use. Then if the observation tube is filled with a solution of sugar and placed in the saccharimeter between two Nicol prisms, a polarizer and an analyzer, so that the light passes through it before reaching the latter prism, the equality of tone in the two half disks is annulled. The analyzer is then made to revolve in the proper direction until the inequality disappears. The angle of rotation is shown by a scale indicating angular degrees, while another scale gives the corresponding percentage of sugar.

R. A. ROBERTS.

**Saccharomy'ces**: a genus of fungi, including the yeast-plant. See FERMENTATION.

**Sacchini**, sāk-kee'nē, ANTONIO MARIA GASPARO: composer; b. at Pozzuoli, near Naples, July 23, 1734; was educated in the conservatory of Sant' Onofrio at Naples; achieved a great success at Rome in 1762 by his opera *Semiramide*, and at Venice in 1768 by his *Alessandro nell'Indie*; after composing about fifty operas for Italian theaters, went to Germany in 1771; repaired next year to London, where he was very successful with his operas, but whence he at last was compelled to flee in 1782 on account of debt; found employment in Paris, but only one of his operas, *Edipe à Colone*, performed after his death, made any great impression. D. in Paris, Oct. 7, 1786.

**Sac City**: city: capital of Sac co., Ia.; on the north fork of the Raccoon river, and the Chicago and N. W. Railway; 45 miles W. by S. of Fort Dodge (for location, see map of Iowa, ref. 4-E). It is in an agricultural and dairy region, is an important trading and shipping point, and derives good power for manufacturing from the river. There are 6 churches, graded public schools, Sac City Institute (Baptist, founded in 1894), a national bank with capital of \$50,000, a State bank with capital of \$75,000, a monthly and 2 weekly periodicals, flour-mill, and windmill and lightning-rod factories. Pop. (1880) 595; (1890) 1,249; (1894) 1,825.

Editor of "Sun."

**Sacomys'idæ** [Mod. Lat., named from *Sacomys*, the typical genus; Gr. σάκος, sack + μῦς, mouse]: a family of mouse-like rodents peculiar to North America; distinguished by the hind limbs being much longer than the fore, and hence adapted for leaping; the presence of large external cheek-pouches not connected with the mouth, and lined with fur within; and the development of a long tail. The skull is thin, with the interorbital space rather broad; the tympanics inflated and vestibular; the petrosals approximated; the squamosals more or less restricted to the orbit; the mastoids roofing over in part the cerebral cavity; the nasals

**Sachs, JULIUS, von, Ph. D.:** botanist; b. at Breslau, Silesia, Oct. 2, 1832; studied at the university at Prague, and in 1859 became assistant in physiological botany in the laboratory of agricultural chemistry at Tharandt; in 1861 Professor of Botany at Bonn; in 1867 Professor of Botany in the University at Freiburg, and in 1868 at Würzburg, where there has been established under his guidance a great institute for the study of plant-physiology. He has published many botanical works, among which the best known are *Handbuch der Experimental-Physiologie der Pflanzen* (1865); *Lehrbuch der Botanik* (1868; 4th ed. 1874; the 3d and 4th editions were translated into English in 1875 and 1892, under the title *Text-book of Botany, Morphological and Physiological*); *Geschichte der Botanik* (1875; trans. into English 1890); *Vorlesungen über Pflanzen-Physiologie* (1882; trans. into English 1887); *Abhandlungen über Pflanzen-Physiologie* (1892). The influence of Sachs upon botany has been greater than that of any other botanist of recent times.

CHARLES E. BESSEY.

**Sac Indians:** See ALGONQUIAN INDIANS.

**Sackbut** [from O. Fr. *saqueboute*, Fr. *saquebute*: Span. *sacabuche*, originally a hooked lance by which foot-soldiers drew or pushed riders from their horses; O. F. *sachier*, draw out < Lat. *sacca're* + O. F. *boter* (> Fr. *bouter*): Ital. *bottare*, push, from Teuton. *bōtan*, O. Eng. *bēatan*]: a wind instrument somewhat resembling the trumpet, having a slide like the modern trombone. It is mentioned in the book of Daniel, but the translation is probably wrong, the English sackbut being a very different instrument, derived from a model found at Pompeii.

**Sackett's Harbor:** village; Jefferson co., N. Y.; on Black River Bay (an inlet of Lake Ontario), and the Rome, Watertown and Ogdensburg Railroad; 8 miles E. of Lake Ontario, 170 miles W. N. W. of Albany (for location, see map of New York, ref. 2-G). It has an excellent inner harbor, with sufficient depth of water to accommodate the largest vessels, good water-power for manufacturing, and agricultural surroundings. Its banking is done at Watertown. The Oneida, the first U. S. war-vessel ever launched on Lake Ontario, was built at Sackett's Harbor in 1809. In the war with Great Britain (1812-15) the village was an important naval station. Two war-vessels, the frigate Superior and the Madison, were built here in eighty and forty-five days respectively from the time the timber was cut. A third war-ship, partially completed when peace was declared, remained on the stocks, and was for many years an object of local pride. The U. S. Government has a military station here, known as Madison barracks. Pop. (1880) 885; (1890) 787.

**Sackville:** town of Westmoreland County, New Brunswick; at the head of the Bay of Fundy and on the Intercolonial Railway, terminus of a branch railway extending 37 miles to Cape Tormentine, on Northumberland Strait; 129 miles N. E. of St. John (see map of Quebec, etc., ref. 5-I). It has a good harbor, a brisk trade, foundries, factories, and a steam-tannery, and is the seat of a considerable ship-building industry. It is the seat of Mt. Allison College (Wesleyan) and of Wesleyan male and female seminaries. Pop. (1891) 1,500.

Revised by M. W. HARRINGTON.

**Sackville, GEORGE GERMAIN, Viscount,** better known as Lord GEORGE GERMAIN, third son of the first Duke of Dorset; soldier; b. in England, Jan. 26, 1716; educated at Westminster School and at Trinity College, Dublin; served with credit at the battles of Dettingen (1743) and Fontenoy (1745), and under the Duke of Cumberland against the Pretender in Scotland; became a privy counselor; was secretary for Ireland 1751; made lieutenant-general 1758; commanded the allied cavalry at the battle of Minden, Aug. 1, 1759, when he failed to execute the orders of the commander-in-chief, Prince Ferdinand of Brunswick, to charge upon the French infantry; was tried by court martial and cashiered early in 1760, but was restored to favor at the accession of George III. (Oct., 1760); entered Parliament 1761; was restored to the privy council 1766; entered the cabinet of Lord North as Secretary of State for the Colonies Oct., 1775; retained that post throughout the war of the American Revolution, distinguishing himself by his bitterness against the Americans, and resigned Feb., 1782, on which occasion he was created Viscount Sackville. D. Aug. 26, 1785. He is one of the persons whose claims to the authorship of the letters of Junius have been advocated. See JUNIUS, THE LETTERS OF.

**Sackville, LIONEL SACKVILLE WEST, BARON:** diplomatist; b. at Bourn Hall, Cambridgeshire, England, July 19, 1827; educated at home; entered diplomatic service 1847; minister to Argentine Republic 1873; to Spain 1878; to the U. S. 1881; represented Great Britain in the Washington conference on Samoan affairs 1887; negotiated Fisheries Treaty of Washington 1888; having become a *persona non grata* on account of a letter written by him to a Mr. Murchison in advocacy of the re-election of President Cleveland in 1888 (on the ground that it would be to the advantage of Great Britain), he received his passports from the U. S. Government and returned to England.

**Sackville, THOMAS:** See DORSET, THOMAS SACKVILLE.

**Saco:** city; York co., Me.; on the Saco river, and the Boston and Maine Railroad; 14 miles W. S. W. of Portland, 100 miles E. of Boston (for location, see map of Maine, ref. 11-A). The river, which is here navigable for vessels of 9 feet draught during nine months of the year, provides excellent power for manufacturing by a fall of 40 feet, and is crossed by four bridges. The city is surrounded by an agricultural region; contains a public high school, 14 public-school buildings, Thornton Academy, 2 libraries (York Institute, founded 1866, and Dyer, founded 1881) containing over 10,000 volumes, 2 national banks, and 2 savings-banks; and has manufactories of cotton goods, cotton-machinery, boots and shoes, lumber, brushes, belting, and other articles. There is considerable coasting trade. About 3½ miles from the city is Old Orchard beach, a popular summer resort, with commodious hotels, and the grounds of Methodist Episcopal national and district camp-meetings. Pop. (1880) 6,389; (1890) 6,075.

**Saco River:** a stream which rises in the White Mountains, New Hampshire, and flows S. E. 160 miles through New Hampshire and Maine to the Atlantic; has several considerable falls, one of which, Great Falls, is 72 feet in height, and furnishes water-power, which is utilized at many places for manufactories.

**Sacrament** [from Lat. *sacramen'tum*, oath, sacred thing, mystery, deriv. of *sacra're*, make sacred, declare sacred, deriv. of *sa'cer*, sacred]: a term used in the Church since Tertullian (about 200), in a loose sense, of sacred doctrines and ceremonies (like the Gr. *μυστήριον*), and then, more particularly, of baptism, the Eucharist, and a few other solemn rites connected with Christian worship. St. Augustine defines sacrament in the narrower sense to be the visible sign of an invisible grace (*signum visibile gratiæ invisibilis*). To this was afterward added by Protestants, as a third mark, that it must be instituted by Christ and enjoined upon his followers. Sacraments are also called signs, seals, and means of grace. Their number is by Protestants confined to two—viz., baptism and the Lord's Supper—on the ground that these alone are instituted by Christ and expressly commanded to be observed to the end of time. The Roman Catholic and the Greek Churches add to them five others—viz., confirmation, penance, extreme unction, ordination, and matrimony. The Council of Trent anathematizes those who deny that there are more or less than seven sacraments (*esse plura vel pauciora quam septem sacramenta*). In the Greek Church they are called "mysteries." As to the efficacy of the sacraments, Protestants require faith as a subjective condition, while the Roman Catholic Church teaches that the sacraments work *ex opere operato*—i. e. by the inherent power God has imparted to the institution or by the performance of the act. The Roman Catholic Church curses any one that "saith that, in the three sacraments, to wit, baptism, confirmation, and order [ordination], there is not imprinted in the soul a character, that is, a certain spiritual and indelible mark, on account of which they can not be repeated." (*Canons and Decrees of the Council of Trent*, vii., canon ix.; Schaff, *Creeds*, ii., 121.) There has been much controversy about the sacraments, especially the Lord's Supper, which is sometimes emphatically called the sacrament, between Protestants and Roman Catholics, and also between Luther, Zwingli, and Calvin, and their followers. The Quakers reject the sacraments as external ceremonies, and hold only to internal baptism or regeneration of the Spirit, and internal communion with Christ. See articles on the several sacraments, especially EUCHARIST.

Revised by S. M. JACKSON.

**Sacramentarians:** the opprobrious epithet applied to the followers of Zwingli by the Lutherans in Reformation times because the former denied the presence of the body

should obtain the final victory was always the central point of their national existence. Meantime, sacrifices in great variety were provided, but those especially appointed as "sin-offerings" were always of the same character and value. A more valuable sacrifice was indeed required as the sin-offering of the high priest or of the collective congregation, and also one slightly more valuable from a "prince," for obvious reasons; but there was no gradation in the value of the victim in proportion to the aggravation of the offense. Their efficacy was thus made to depend simply upon the Divine appointment.

The chief kinds of Hebrew sacrifices were the whole burnt-offering, which was wholly consumed upon the altar, and with which an oblation of fine flour and oil, with incense, and a drink-offering of wine were offered; the sin-offering, of which only the fat and kidneys were burned upon the altar, the flesh being either "burned without the camp" in case the blood had been sprinkled within the sanctuary, or eaten by the priests alone in case the blood had been only sprinkled upon the brazen altar; and the trespass-offering, which is distinguished clearly from the last, although the ground of the distinction is not entirely clear. These were all propitiatory offerings, and with them the priest was required "to make atonement" for the people. Besides these were the peace-offerings, perhaps the most common of all, which might be offered in any number and of any sacrificial animal. Of these, the same parts were burned on the altar, a portion given to the priests to be eaten by them and their families, and the rest of the flesh eaten by the offerer and his friends in a holy feast before the Lord. There were other important sacrifices required. Such were the Passover lamb offered in memory of the deliverance from Egypt and as a special type of Christ by each head of a family on the fourteenth of the month Nisan in each year, and eaten in their homes on the following night; the two goats on the great day of atonement in each year, of which one was sacrificed at the altar, the other sent as a "scape-goat" into the wilderness; the red heifer, burned without the camp and its ashes used in purifications; and a great variety of sacrifices for individuals on special occasions. The original comprehensive offering, from which all the others were specialized, appears to have been the burnt-offering.

Under the Levitical law the essential point of the sacrifice was the blood, the treatment of which always formed the culminating point in the sacrificial ritual. A burnt-offering of a lamb for the whole people was regularly offered every morning and evening, with its accompanying oblation or "meat-offering." In regard to the sin-offering, in order to bring it within the reach of all it was provided that for the required animal might be substituted by the poor a pair of doves, or even in case of extreme poverty an offering of flour. The symbolical character and significance of the sacrifices are set forth at some length in the Epistle to the Hebrews. See G. F. Oehler, *Theology of the Old Testament*, Eng. trans., ed. G. E. Day (New York, 1883); A. Cave, *The Scriptural Doctrine of Sacrifice* (2d ed. Edinburgh, 1890); and W. Robertson Smith, *Religion of the Semites* (2d ed. 1894). Revised by S. M. JACKSON.

**Sacrobosco**, JOANNES, de: Latinized name of JOHN HOLYWOOD, an English mathematician of the thirteenth century. Little is known of him, except that he entered the University of Paris 1221, became professor there, and died in 1244 or 1256. He was the author of a treatise *De Sphæra Mundi*, a paraphrase of a part of Ptolemy's *Almagest*, which he had employed in Arabic. It was first printed in 1472, and was reprinted with commentaries about sixty times until the end of the seventeenth century.

**Sacrum** [Mod. Lat. (sc. os, bone), the sacred bone, neut. of Lat. *sa'cer*, sacred]: in the vertebrate skeleton, a bone situated below or behind the lumbar and above or before the coccygeal vertebrae. In man it is formed of five (rarely four or six) united vertebrae. It is large, roughly triangular, and is penetrated by foramina for the passage of nerves. It is developed from thirty-five centers of ossification. The rabbins called it *luz*, and said that it never decays, but forms the germ of the new body at the resurrection; and the Arabs say that the judgment angel sits upon it and judges the soul of the departed.

**Sacy**, *sā'see'*, ANTOINE ISAAC, Baron Silvestre, de: Orientalist; b. in Paris, France, Sept. 21, 1758; studied law and Oriental languages; elected to the Académie des Inscriptions 1785; overseer in the mint 1791-92; Professor of Arabic at

the École des Langues orientales; called to the Institute (section of literature and fine arts) 1795, but did not take his place till 1803; Professor of Persian at the Collège de France 1805; represented Paris in the Corps Législatif 1805-15; created baron by the emperor 1813; administrator of the Collège de France and the École des Langues orientales 1822; entered the Chamber of Peers 1832; conservator of the Oriental MSS. of the Bibliothèque Nationale and perpetual secretary of the Académie des Inscriptions 1833. D. in Paris, Feb. 21, 1838. A few of his principal works are: *Grammaire Arabe* (1810; 2d ed. 1831); *Chrestomathie Arabe* (1806; 2d ed. 1826); *Principes de la Grammaire générale* (1799; 8th ed. 1852); *Relation de l'Égypte par Abd-allatiph* (1810); *Mémoire d'histoire et de littérature orientales* (1818); *Les Séances de Hariri* (1822; 2d ed. 1847); and *Exposé de la religion des Druses* (1838). See Re naud, *Notice historique et littéraire sur Silvestre de Sacy* (Paris, 1838). RICHARD GOTTHEIL.

**Sacy**, SAMUEL USTAZADE SILVESTRE, de: journalist; son of Baron de Sacy; b. in Paris, Oct. 17, 1801; appointed on the staff of the *Journal des Débats* 1828, which position he held for more than thirty years; member of the Académie May 18, 1854; keeper of the Mazarin Library 1836; its administrator 1848; member of the council of public education 1864. He published essays, *Variétés littéraires* (1855); edited *Bibliothèque Spirituelle* and *Lettres de Madame de Sévigné* (1861-64). D. Feb. 14, 1879. R. G.

**Saddle**: a contrivance designed to rest on the back of an animal and serve as a seat for a rider or as a support for other weights. It thus includes the pack-saddle and the part of a single harness that supports the weight of the shafts; for four-wheeled vehicles this is merely a broad padded strap buckled around the animal's body, but for a heavy two-wheeled cart, since part of the weight of the load rests on the shafts, the saddle is large and more heavily padded than a riding-saddle. The pack-saddle varies much in form, but that most used in the transportation of goods consists of crossed sticks, like a common saw-horse, securely fastened to saddle-bars of long bearing.

The use of riding-saddles is of ancient origin. Pausanias relates that Constantine the younger was killed in the year 340 by falling from his saddle, and the Emperor Theodosius, in the year 385, forbade the use on post-horses of saddles weighing over 60 lb. Riding-saddles may be classed under two types, Hungarian and Moorish. The original of the former consisted of wide parallel bars, joined at the ends by heavy bows, to which were secured parallel strips of hide. There were no stirrups. The Hungarian saddle of the present closely resembles the primitive one, while the English saddle is the most highly developed form of the type in Europe, and the McClellan saddle (named after Gen. George B. McClellan) the best in the U. S. These two saddles, though from the same source, are quite different in construction. The tree of the English saddle is a skeleton on which the saddle is made. As completed, the seat and bearings are all padded, with scarcely anything of the original outline showing, except at the edges. Probably in point of style it is the most perfect saddle made, but one who is in the saddle all day is glad to exchange it for something easier. The McClellan tree forms the saddle itself. The tree-bows are shaped to fit the animal's back, and padding is dispensed with, even for the seat. It is covered with rawhide, and all but necessary strapping is eliminated. The fender of the McClellan is borrowed from the Mexican saddle, and is improved in the modification of the McClellan saddle known as the Whitman, after its inventor, Col. Whitman, U. S. army. The trade nomenclature of saddles of the Hungarian type includes also the Shaftoe, Somerset, Kilgore, and Morgan. A later form is a pneumatic saddle, in which a rubber bag, filled with air, is placed under the leather covering of the seat. The object is to increase the comfort of the rider, and lessen the concussion of his weight on the animal's back. It has been most successful as applied to racing-saddles.

The so-called Moorish type probably originated in Persia. In the primitive form a number of skins were superimposed on the animal's back, with a front and back wooden cantle, the whole confined by straps completely surrounding the animal. In the construction of its various forms the finest fabrics have been employed, and it has always been the most expensive saddle made. Mexican, Texas, and California saddles are derived from this type, retaining the main features of the original. The Moorish saddle has heavy, long

edited by Arthur Clifford, with a memoir and notes by Sir Walter Scott, under the title *State Papers and Letters of Sir R. Sadler* (2 vols., 1809).

**Sado**, *saa-dō*: an island in the Sea of Japan; about 30 miles from the Japanese mainland; between 138° and 139° E. lon. and 37½° and 38½° N. lat. It forms part of the prefecture of Niigata, and has a population of about 103,000; it possesses famous gold and silver mines, but the output from these has not of late years much more than covered expenses of working. The island, which is chiefly of limestone formation, is very hilly, with one plain between two mountain groups. J. M. D.

**Sadoletto**, *saa-dō-lā-tō*, Jacopo: cardinal; b. at Modena, Italy, July 14, 1477; was ordained priest in Rome in 1502; appointed secretary to Leo X. in 1513; made Bishop of Carpentras, in France, in 1517, and cardinal in 1536. D. in Rome, Oct. 18, 1547. He made a favorable impression even on the most zealous Reformers by his conciliatory spirit, and he was often employed in the diplomatic negotiations between Charles V., Francis I., and the popes. His writings, *Philosophiae Consolationes* (1502); *De Liberis recte instituendis* (1533); *Phœdrus sive de Laudibus Philosophiae* (1538), etc., and his *Letters* were published in a collected edition at Verona (4 vols., 1737) and at Rome (5 vols., 1759). See Joly, *Étude sur Sadolet* (Caen, 1857).

Revised by J. J. KEANE.

**Sadowa**, *saa-dō-va*: village of Bohemia; on the Bistritz; 9 miles N. W. of Königgrätz (see map of Austria-Hungary, ref. 8-E). This is the name given by the Austrians to the battle of Königgrätz (*q. v.*), in which, on July 3, 1866, 240,000 Prussians defeated 220,000 Austrians and Saxons. The Prussian loss was 9,000 men, while the Austrians lost over 40,000 men in killed, wounded, and prisoners.

**Safed** [= Arab.; Heb. *Tzephath*, liter., watch-tower]: town in Palestine, in the ancient province of Galilee (altitude, 2,749 feet), with splendid view of Jebel Zebüt, Jebel Jermak, Tabor, and Carmel; thought by some to be mentioned in Matt. v. 14. A fortress was built there by Fulke 1140, defended by the Templars; taken by the Sultan of Damascus 1220; reconstructed by the Templars 1240; taken definitely by the Moslems 1266, and made capital of a province. In 1799 it was occupied by a French garrison. Jews settled there in large numbers in the sixteenth century, expecting that the Messiah would make it his capital. Its bazaars are of little importance. See Neubauer, *Géogr. d. Talmud* (1868, p. 227); Baedeker, *Palest. und Syria* (2d ed. 1894, p. 258); Tristram, *Land of Israel* (London, 1885, p. 576).

RICHARD GOTTHEIL.

**Safes**: structures designed to protect papers, money, or other contents from loss either by theft or by fire. For the latter see FIRE-PROOF SAFES. Those supposed to be proof against burglarious attacks, directed either upon the inclosing walls or merely against the lock (see Lock) securing the door, should successfully resist for twelve hours at least any attempts to open them; but such is the perfection of the mechanical and chemical means used that probably there are none of the so-called burglar-proof safes the contents of which could not be abstracted by an undisturbed burglar in very much less time.

Burglar-proof safes are of two distinct constructions: 1. Those which have walls cast in one mass of iron or steel or of some alloy of these metals. 2. Those having their walls built up of bars or plates of iron or steel secured together by bolts or rivets. The first class may be subdivided as follows, viz.: *a.* Safes in which the resistance to attack depends upon their form, and the extreme hardness and toughness of the cast metal used. Such are the spherical safes made from an alloy of iron and chromium. *b.* Safes having the cast metal of their walls re-enforced by a network of wrought-iron or steel rods, about which the molten iron or steel is poured, and which is solidly inclosed by the cast metal when it cools. The second class may also be divided in the following way, viz.: *c.* Safes made of bars or plates of homogeneous wrought iron or steel. *d.* Safes in which the bars or plates are composed of layers of iron and steel welded together. *e.* Safes made of layers of bars or plates of wrought iron or steel, between which are interposed one or more layers of bars of hard cast iron.

For most burglar-proof safes of recent construction great pains have been taken to conceal the heads of the bolts or rivets, and in some cases these have been made so short as to simply fasten each layer of plates to those adjacent, but in

no instance extending through the whole thickness of the walls. The doors have also been fitted with the greatest accuracy in order to prevent the introduction of explosives.

Apertures through the doors of safes for the passage of spindles for operating bolts and locks have been found a source of insecurity, and therefore doors for burglar-proof safes have been contrived so that when shut they are fastened by bolts operated automatically, and they are provided with clockwork which can be so adjusted before the door is closed that at a certain hour the bolts are drawn by the release and action of powerful springs. W. F. DUFFEE.

**Safety-lamp**: a lamp so constructed as to be safely employed in an atmosphere so contaminated with fire-damp as to explode when a naked flame is exposed to it. Freshly exposed coal underground often gives forth one or more kinds of gas, such as carbon dioxide (CO<sub>2</sub>), oxygen, nitrogen, and fire-damp (CH<sub>4</sub>). To the latter other names applied are carburetted hydrogen, methane, and MARSH-GAS (*q. v.*). From a single ton of anthracite coal more than 600 cubic feet of gas have been emitted, of which 93 per cent. was fire-damp. Bituminous coal, being softer and more porous, parts with its gas more easily, though the total amount per ton is not so large. If the atmosphere contain from 6 to 17 per cent. of fire-damp the mixture is dangerously explosive. Outside of these two limits it is still inflammable. It is of the utmost importance therefore that the ventilation of a coal mine shall be good enough to prevent contamination of the air with fire-damp. Since perfect ventilation is impossible, the miner needs a lamp for illuminating purposes that may be used in a slightly contaminated atmosphere, and the inspector needs the means of detecting such contamination, however slight.

Between 1812 and 1816 several forms of safety-lamp were devised, that of Sir Humphry Davy being the one which has remained most extensively in use. For any given fuel the temperature at which ignition begins is lower than that developed by the subsequent process of combustion; for example, the ignition-point of phosphorus is below the boiling-point of water, while the temperature due to its combustion exceeds that of red-hot iron. Davy discovered that in a quiet atmosphere a mere partition of wire gauze is enough to prevent the transmission of flame, the gauze absorbing and radiating enough heat to reduce the temperature below the ignition-point. To a small, cylindrical oil-lamp he attached a cylinder of iron-wire gauze about 6 inches long and less than 2 inches in diameter, which inclosed the flame. It was supported in a framework of small metal rods fitted into terminal flat brass rings. One of these enclosed the body of the lamp, while the other was covered with gauze and served for attachment of a handle. The meshes of the gauze permitted free access of air to the flame and transmission of part of its light. The standard adopted as a limit of safety was iron gauze with 784 meshes per square inch, the wire being about ⅛ inch in thickness. When such a lamp is carried into an atmosphere contaminated with from 3 to 6 per cent. of fire-damp the flame becomes elongated and smoky, being surrounded by a zone of mixed gases less rich in oxygen than air is, and containing carbon and hydrogen, both of which are combustible. The flame therefore occupies an appreciably larger volume, and indicates the approach of danger before an actually explosive atmosphere is reached. Within a dangerous atmosphere the entire space within the cylinder of gauze becomes occupied with flame, but this may for some time fail to be transmitted through the gauze. Such transmission may occur after the gauze becomes red-hot, or if the lamp is exposed to a draught. The indication of danger should be sufficient to cause the withdrawal of the miner from such surroundings. Modifications of the Davy lamp have come into use, chiefly with a view to surrounding the flame with glass so as to increase the effective radiation of light; but in each case access and egress of air are effected through one or more thicknesses of wire gauze. Mueseler's lamp is extensively employed in continental Europe; besides the glass chimney it has a conical metallic chimney above the flame to increase the draught of feed-air.

Of late years electricity has been extensively applied to mining operations, and the most obvious application would naturally seem to be the substitution of the incandescent electric lamp for the miner's wire-gauze safety-lamp, since the former, if carefully handled, is quite safe in any atmosphere whatever. The difficulty attendant upon the attainment of effective insulation, suitable wiring, and the pre-

dry; soak half an hour in a cold fat-soap bath; dry; then dye lukewarm in the solution of saffranine. (2) Soak the cotton from four to six hours in a lukewarm bath to which the extract from  $\frac{1}{2}$  lb. of nutgalls has been added; wring; soak one hour in a cold bath containing for every pound of cotton  $\frac{1}{2}$  to  $\frac{3}{4}$  oz. of perchloride of tin crystals; wash; dye in a lukewarm bath to which the color is added in three or four installments to secure an even color. For a dark-rose or cherry color use the second method, doubling the quantity of nut-galls and increasing slightly the quantity of perchloride of tin. For ponceau and scarlet, first give the cotton, after treatment with hyposulphite, a bottom of turmeric (hot), then continue by the second method. To darken the shades, let the cotton soak in the gall-bath over night. Tannin may be used in place of nutgalls,  $\frac{3}{4}$  oz. to the pound of cotton. Lastly, pass all cotton dyed with saffranine through a cold bath slightly acidulated with acetic acid.

**Saffron** [from O. Fr. *safran* (whence Germ. *safran*), from Arab. *za'farān*, saffron, deriv. of *safrā*, yellow]: a yellow substance, consisting of the stigmas, with part of the styles, of the saffron-crocus (*Crocus sativus*), a plant indigenous in Greece and Asia Minor, and extensively cultivated in Austria, France, and Spain, and formerly in England. Spanish saffron is the best. It is said that 100,000 flowers are necessary to produce 1 lb. of saffron. This dye is often adulterated with safflower, marigold, pomegranate, and other flowers. The stigmas of the true saffron are from 1 inch to 1½ inches long, narrow and roundish where they are attached to the style, but spreading and club-shaped near the extremity, which is truncated. They have an orange or brownish-red color, yellow in the narrower part, an agreeable aromatic, almost intoxicating, odor, and an aromatic bitter taste, and impart a yellow color to the saliva and to water, alcohol, and oils. Strong sulphuric acid colors them blue, then red, and finally brown. Saffron was formerly a favorite dye, but is now rarely used as such. It is employed in medicine for coloring tinctures and for liqueurs, varnishes, confectionery, and especially cakes in the west of England. The coloring-matter of saffron is a glucoside, to which the names saffranine, saffron-yellow, polychroite, and crocine have been given.

Revised by IRA REMSEN.

**Saffron of Mars:** See IRON (*Medicinal Uses of Iron*).

**Sa'fi:** an Atlantic port of Morocco, Africa, well fortified, with a fair harbor (see map of Africa, ref. 1-B). It is visited occasionally by Hamburg and other steamers, but its former considerable trade has been largely captured by Mogador, S. of it. Pop. 9,000, one-third Jews.

**Sa'gan:** town and railway center in the province of Silesia, Prussia; on the Bober (see map of German Empire, ref. 4-H). It has a fine palace with a beautiful park, and extensive manufactures of woolen and cotton cloth. Pop. (1890) 12,623.

**Sagar, saa-gūr', or Saugor:** an island in the delta of the Ganges, at the mouth of the Hugli; 23 miles long N. and S., and 2½ to 8 miles broad. It is celebrated for its disasters, and as a station for Hindu pilgrims. Its misfortunes are due to the storm-waves that sometimes sweep over it. According to the Calcutta Review 200,000 people were destroyed by the storm-wave of 1688. Before the cyclone of 1864 it had 5,625 inhabitants, of whom only 1,488 survived. It has few permanent inhabitants, but is visited annually, in January, by from 100,000 to 200,000 pilgrims. The celebration attended by them lasts only three days, but a certain proportion remain for weeks to take baths. The island contains a meteorological observatory, a lighthouse, and telegraph station. It is infertile, covered with jungles, and infested by wild beasts.

MARK W. HARRINGTON.

**Sagar, or Saugor:** city of the Central Provinces, British India, and capital of a district of Sagar; lat. 23° 50' N., long. 78° 49' E.; on the border of the artificial lake Sagar (see map of N. India, ref. 7-E). The lake is about 4 miles in circumference, and is surrounded by temples with platforms for baths. The city is picturesque, well built, with wide streets. Near by is a large and old fort commanding the town, a prison, and a cantonment. Its chief commerce is in salt. Pop. (1891), 44,674.—SAGAR is also the name of a town in Mysore, and of one in Haidarabad.

M. W. II.

**Sagas:** See ICELANDIC LITERATURE and SCANDINAVIAN LITERATURE.

**Sagas' ta, PRÁXEDES MATEO:** statesman; b. at Torrecilla de Cameros, Spain, July 21, 1827; studied at the School of

Engineers in Madrid; was elected to the Constituent Cortes 1854; took part in the insurrection of 1856 and fled to France; returned to Spain on the proclamation of the amnesty and became professor in the School of Engineers in Madrid, and editor of *La Iberia*, the principal organ of the progressist party; after the unsuccessful insurrection of June, 1866, he again fled to France, but returned after the fall of Queen Isabella II.; member of Gen. Prim's first cabinet; Minister of State Jan., 1870; declared for the monarchy; Minister of State in the first cabinet of King Amadeus; successively Minister of Foreign Affairs, Minister of the Interior, and president of council, 1874, under Marshal Serrano; gave in his adherence to Alfonso XII. 1875; joined the new liberal party, 1880; came into power at the head of a coalition in 1881, which was superseded in 1883 by a cabinet formed from the dynastic left. On the death of Alfonso XII., Nov. 23, 1885, he again took charge of the Government at the request of the queen regent; his ministry was overthrown 1890, and the conservatives returned to power under Castillo. On the latter's resignation in Dec., 1892, Sagasta succeeded him; in Mar., 1895, he resigned, and was again succeeded by Castillo.

C. H. THURBER.

**Sage** [Fr. *sauge*]: a plant of the genus *Salvia* of the mint family (*Labiatae*). *S. officinalis* is a familiar garden-herb. Its leaves are employed in flavoring meats and other dishes, and sage-tea, a decoction of its leaves, is a useful domestic remedy, having aromatic, stimulant, and tonic powers.

**Sage, ALAIN RENÉ, le:** See LESAGE.

**Sage-brush:** the popular name of species of bitter shrubs of the genus *Artemisia* (family *Compositae*) growing upon the Great Plains and in the Rocky Mountains of North America. *A. tridentata* is from 3 to 6 or even 10 to 12 feet in height, and is the common large sage-brush of Idaho, Montana, Wyoming, and Colorado, extending also eastward to the plains. Among other common species are *A. cana* and *A. filifolia*.

CHARLES E. BESSEY.

**Sage-cock, or Cock of the Plains:** a kind of grouse, the *Centrocercus urophasianus*. It is characterized, among the tetraonine forms which are feathered to the toes but with the toes themselves bare, by the tail being much elongated and cuneate, and the constituent feathers narrow and attenuated, and the shafts of the feathers on the lower part of the throat very spinous. The color above is brownish yellow, with blackish areas on the inner fields of the feathers; the wing has light-colored shafts to the feathers of the coverts; the lower portions of the breast are whitish, the abdomen marked with a broad black area. The male bird has very large, dilatable, naked, and yellow air-sacs on each side of the neck, bordered by stiff, scale-like feathers. The species is the largest American representative of the family, the male having an average length of over 30 inches, and the female about 21 or 22; but these dimensions are frequently much exceeded. It is confined to the arid plains of the western parts of the U. S., ranging from the Black Hills in the E. to California and Oregon in the W., and from British America in the N. to Arizona in the S. In those plains the sage-brush (*Artemisia*) grows in abundance, and the sage-cock feeds upon that plant, whereby a bitter flavor is imparted to the flesh; but it is said that if the bird is eviscerated at once after being killed this taint is not so marked. There is a simple muscular membranous bag, contrasting with the peculiarly developed gizzard of the ordinary species.

Revised by F. A. LUCAS.

**Sag'enite:** See QUARTZ.

**Saghalien, saa-gaā-leen', or Sakhalin,** known as KARAFUTO by the Japanese and as TARAIO by the natives: a long and narrow island off the east coast of Asia, stretching directly S. from the mouth of the Amur river, between lat. 45° 54' and 54° 24' N. Its length is 670 miles, breadth from 15 to 80 miles, its area 29,336 sq. miles, and it is traversed by parallel mountain chains, thickly wooded, the highest peak being Kitapal (La Martinière), near the center of the island, 4,860 feet high. The chief productions are coal of good quality, furs, and timber; the climate and soil do not favor agriculture. At Dui on the west coast, and Mauka Cove farther S. are Government penal stations; the last is also a fishing center. Since 1875, when Japan ceded her rights over the southern portion of the island in exchange for the northern Kuriles, Saghalien has been altogether Russian. The natives, mostly of Ainu stock, number 3,200; a dictionary of their tongue was compiled by M. M. Dobrotvorski, and completed and published in 1876 by his brother Ivan. J. M. DIXON.

Mediterranean, but the resulting seas combined would not be as large as Lake Tanganyika or Lake Nyassa. The other depressed area is in the northern part of the Libyan desert (the oases of Araj and Siouah), nearly E. of Fayoum and 150 miles from the Mediterranean, from which it is separated by an elevated plateau.

A mountainous region stretches through the desert S. E. and N. W., extending from S. of Algeria to Darfur, dividing the eastern or Libyan desert from the Central and Western Sahara, and having its backbone in the Tassili and Tibesti Mountains. They make a nearly unbroken range 1,100 miles long, culminating in Mt. Tarso of Tibesti, about 8,000 feet high. To the W. of this range and connected with it are the mountain complexes of Ahaggar and Azjer, which occupy the geographic center of the Sahara, with elevations of from 4,000 to 5,000 feet. These, with areas of lower mountains to the N. and S., make an elevated band which crosses the Sahara nearly centrally from the Syrtis on the N. to Sokoto on the S.

The remainder is much diversified by plains, hills, and valleys, and is furrowed by the beds of streams, generally dry, but having, nevertheless, as well-defined basins as in other parts of the world. The surface is sometimes a shingly, denuded, arid plateau (*hamada* of the Arabs), drearily uniform, slightly undulating, but little intersected, from the surface of which the wind sweeps every particle small enough to be carried away. This may be succeeded by a region of ravines and valleys (*wadies*) which are sometimes simple coulees, sometimes extensive, with a full series of ramifications. With these are associated sharp escarpments, which are the edges of the higher plateaus, and sometimes isolated buttes (*gara*, plural *gour*, of the Arabs). Not rarely the wady ends in a closed basin (*sebkha*), which may be always dry or occasionally filled with water, making a temporary lagoon. The latter when dry are covered with a layer of saline efflorescence which, under favorable conditions, forms a veritable crust. Elsewhere are plains of sands heaped into dunes. The latter are grouped irregularly, and reach sometimes a height of 300 or 400 feet, but are not so subject to shifting by the wind as is sometimes represented. They remain fairly permanent from generation to generation, and, although heavy wind-storms may carry considerable quantities of sand, the trails are not generally obliterated nor the wells covered. These seas of sand have the name of *erg*, and of these four large ones are known (two in the Libyan desert and two at the W. and parallel to the Atlantic coast). Besides these there is a series of smaller ones from Southern Algeria to Fezzan, and some other isolated ones of small size.

A few of the rivers of the Sahara debouch into the Atlantic, the principal ones being the Draa and the Sakiet-el-Hamra, near the northwestern angle of the Sahara, the former with water, the latter without. Many smaller valleys debouch into the Syrtis of the Mediterranean. The Libyan desert has few of the wadies. The richest part of the Sahara for these stream-beds is the central elevated region of Ahaggar, Azjer, and Tassili. From this region radiate innumerable stream-beds, some of which are lost in the sand at lower levels, while others can be traced to the Mediterranean or to the basin of the Niger. Lake Chad has a similar but less extensive system. The existence of these stream-beds suggests that formerly the Sahara may have been a well-watered region. If so it was probably in late geological, certainly before historical, times. Perhaps they are due to the occasional filling which they undergo, which is due to the intense local storms (cloud-bursts), in which the rain comes when it comes at all. The stream is then filled with a torrent which advances with impetuous force and continues until lost in a lagoon, in the sand, or in some regular outlet, as Lake Chad. Such streams exert powerful erosive action, doing in a few hours the work which it would take a tamer stream years to perform. To such streams is probably also due the subterranean water which forms permanent or temporary wells, and whose existence renders possible commerce across the Sahara.

**Geology.**—The Sahara is geologically as diversified as other regions. The core of the elevated center about Ahaggar is formed of the early pre-fossiliferous crystalline rocks. About this core, with prolongations to the Atlas on the one side and Tibesti on the other, is found an enormous area where Palæozoic rocks come to the surface. The next in the series is a large development of the Cretaceous, which extends from Tunis to the Nubian desert and Kordofan. The Eocene and Miocene cover a large area in the northern part of the Libyan desert, and the Pliocene and Quaternary occupy

the southern and central part of the Western Sahara. Evidence of volcanic action is found in the Ahaggar and Tibesti Mountains and to the E. of Fezzan.

**Climate.**—The mean annual temperatures of the Sahara are about those of Northern Mexico, passing from 68° F. at the north to 86° at the south. The January means vary from 40° at the north to 73° at the south. In summer it is hottest in the center, the July mean temperatures over a large part of the interior being 95° or more and falling to 86° at the margins. The mean annual range varies from 20° at the margins to 40° within. The true features of the temperature only appear when the extremes and the daily range are consulted. The difference between day and night often runs to 50° or more. In the northern and central parts of the desert winter temperatures below freezing are common. In summer temperatures of about 120° F. are not rare over the Sahara, and Rohlf's once recorded 127° F. in the shade. This record has been surpassed in the Colorado desert of Southern California, where a record of 128° F. was made in July, 1887.

In winter the desert surface is occupied by a part of the high-pressure band which surrounds the earth. The winds then flow gently out in all directions, except in the N. W., where an inflowing current from the N. W. enters by crossing the Atlas Mountains. In the summer the surface is occupied by an area of relatively low pressure. The winds then generally flow into the desert, but there become dry because of the high temperatures.

The moisture of the air is generally very slight. In many cases records of only 2 per cent. of relative humidity have been made, and in a few cases the instrument has failed to find an appreciable amount, making a record of 0 per cent. Under such conditions the sky is intensely blue, except when the air is loaded with fine dust, and mirages are common in the heat of the day. Dew and hoar frost are almost unknown. Yet there is probably no part of the desert where rain does not fall occasionally, but sometimes years intervene between showers. Beginning at the south, the rainfall on the parallel of 10° N. lat. is about 50 inches, and the rainy season is in middle and late summer. This is gradually reduced northward until, on the parallel 20° N., the amount is only from 5 to 8 inches annually. North of this, regular mid and late summer rains occur in the mountainous regions, but elsewhere the rainfall becomes irregular and occasional only, giving, however, an annual average of 5 inches or more. This condition continues to the Atlas Mountains on the W. and to the Mediterranean on the E., except that in Algiers the Mediterranean regimen of rainfall (spring and late autumn, with dry September) obtains over a narrow strip on the edge of the desert.

The winds that come from the Sahara and blow out over the neighboring regions are of a peculiar and sometimes destructive character. They have received many names—harmattan, leste, leveche, sirocco (of Sicily), chamsin, simoom. They are characterized by heat, dryness, and dust. The heavy winds of the interior, carrying much sand, are generally from the S.

**Cause of Aridity.**—This desert has continued from the earliest known times without material change, except a possible progressive (but slight) increase in aridity. From what precedes it appears that it is not due to solar heat (as thought by the ancients), nor to recent elevation above the sea, nor character of surface, nor is it due to the northeast trade wind, to which it was attributed by Humboldt. The aridity is a purely atmospheric phenomenon, due to the outflow of wind in winter, and to the great heat when the inflow takes place in summer. The direction of the winds again is due to the distribution of atmospheric pressure. As the details of the last are due to the distribution of land and water, the Sahara must have been a desert ever since the continents took on their present form.

**Flora and Fauna.**—The flora, though poor, is interesting because peculiar, and not formed by an intermingling of that of the Sudan and Mediterranean coast. It is rarely entirely lacking; even in the sandy deserts and the oases (comprising about 75,000 sq. miles) are true islands of verdure. Here the chief plant is the date-palm. The fauna is even poorer than the flora. In the *erg* or *hamada* one can travel for days without seeing an animal. In the mountains are jackals, wolves, antelopes, and sometimes lions and tigers. The birds are very few in species and number. The reptiles are relatively abundant, and permanent waters are stocked with fish and other water animals.

**Population.**—The central part of Sahara, from Tunis and Tripoli to the Central Sudan, is occupied by the Tuaregs.

sails follow the rules given as to form and class, but have peculiar names. The most common are spritsails, standing lugs, dipping lugs, and sliding gunters.

**Sailfish**: any fish of the genus *Histiophorus*, having a remarkably long and high dorsal fin. The ventral fins are modified into elongated style-form appendages of two or three rays, and there are small persistent teeth. The species have an elongated sword, as in the swordfishes (*Xiphiidae*), but are regarded as the type of a special family (*Histiophoridae*), including also the spearfishes (*Tetrapturus*). They are inhabitants of warm seas, especially the Indo-Pacific, but *Histiophorus americanus*

Sailfish

ranges N. to Cape Cod in summer. The dorsal fin, erected when the fish floats on the surface, has been likened to a sail. They are known also as banner-fishes and spikefishes.

**Sailing**: See NAVIGATION and GREAT-CIRCLE SAILING.

**Sainfoin** [= Fr.; *sain* sound, wholesome (< Lat., *sanus*) + *foin*, hay (< Lat. *fœnum*)]: a perennial leguminous forage-plant, *Onobrychis sativa*, very valuable on dry, chalky lands, but not much raised in the U.S. It is prized as green forage, as hay, and as a crop to be plowed under.

**Saint** [viâ O. Fr. from Lat. *sanctus*, holy, sacred, (as noun) saint, transl. of Gr. *ἅγιος*, holy, saint]: in the New Testament a title of all Christians (Rom. i. 7; 1 Cor. i. 2; Eph. i. 1; Phil. i. 1, etc.), in the sense that they are called out of the world, regenerated by the Holy Spirit, and consecrated to God and to holiness. In the Apostles' Creed as now recited "the communion of saints" is one of the articles of faith, closely related to the preceding article on "the holy catholic Church," but the clause is not found in the earlier forms of that symbol. The oldest MS. copies of the Gospels bear simply the names of Matthew, Mark, Luke, and John, without "S." attached to them. After the fourth century the term began to be applied to particular persons of special eminence in piety and services to the Church, as the apostles, evangelists, and martyrs. It became the exclusive title of a spiritual nobility or aristocracy. Special honor was paid to their memory, which gradually assumed the character of a limited Christian hero-worship, called by the scholastic divines *doulia* or *veneratio* (as distinct from *latría* or *adoratio*, which is due to God alone, and *hyperdulia*, or a peculiar degree of veneration which is claimed for the Virgin Mary as the mother of our Lord and queen of saints). The Greek and Roman Churches, believing in the active intercession of the saints in heaven in behalf of the struggling Christians on earth, consider it proper and useful to pray to them; with this difference, that God is to be implored as the giver of all blessings, while the saints are to be implored as the friends of God, that through their advocacy may be obtained from him all necessities of life (hence the form *Ora pro nobis*, Pray for us). Protestants reject the worship of saints, images, and relics as inconsistent with the first and second commandments and the exclusive worship of God, and hence they pray directly to God and to Christ.

Who are the saints was a question for a long time left to the public sentiment of the Christian people in the particular nation or province or monastic order to which the saint belonged. The voice of the people was regarded as the voice of God. But to prevent the immoderate increase of the number of saints, the popes since Alexander III. (A. D. 1170) have monopolized the right of canonization—i. e. of deciding and pronouncing a departed Christian to be a saint, and authorizing and prescribing his worship within the Roman Catholic Church. The act of canonization is preceded by a regular process of law, in which one acts as the accuser of the candidate, another as his advocate. The necessary qualifications for the honor are, besides the highest sanctity, the power of working miracles, either during their lifetime, or after their death through their pictures or relics or the invocation of their aid. An Italian proverb says it requires a miracle to prove a miracle. This is especially true after the lapse of several centuries, which usually intervene between the death of a saint and his canonization. In 1862 Pope Pius IX. solemnly canonized twenty-six Japanese missionaries and converts who died in a persecution in 1597, nearly 300 years before. See *Descrizione delle cere-*

*monie che si celebrano nella Basilica Vaticana per le solenni Canonizzazioni dei Santi* (Rome, 1862).

The Roman Catholic Church celebrates the memory of each canonized saint on the day of his death (which is regarded as his birthday in heaven). Its calendar of saints includes: (1) the apostles, evangelists, and most eminent martyrs, fathers, schoolmen, and missionaries down to the Reformation, who are the general property of Christendom; (2) the specifically Roman saints who lived after the Reformation and zealously opposed Protestant doctrines (as Ignatius Loyola, Charles Borromeo); (3) a few popes. The last canonized pope was Pius V. (1566-72), who excommunicated Queen Elizabeth.

The biography of saints has given rise to an immense body of literature. The most learned and extensive work on the subject is the *Acta Sanctorum* of the Bollandists, begun in 1643, embracing 60 vols. fol., and not yet completed. A convenient abridgment is Alban Butler's *Lives of Saints* (in many editions, e. g. 12 vols., Dublin, 1866). Cf. Baring-Gould (Prot.), *Lives of the Saints* (17 vols., London, 1872-92); *Lives of the English Saints*, edited by Cardinal Newman (15 vols., 1844-45); R. M. Stanton (R. C.), *A Menology of England and Wales* (1888).

Revised by S. M. JACKSON.

**St. Albans** (anc. *Verulamium*): city; in Hertfordshire, England; on the Ver, a feeder of the Colne; 20 miles N. N. W. of London (see map of England, ref. 11-1). In commemoration of the martyrdom of St. Alban (303) Offa, King of Mercia, founded a Benedictine abbey here in 793, which obtained precedence over all other abbeys in England. The abbey-church was rebuilt by its abbot, Paul of Caen, after 1077, and consecrated in 1115. This, even after many alterations and additions, still remains the most important example of Norman architecture in England. It has been considerably restored by Sir Gilbert Scott and Sir Edmund Beckett (1871-85). Its extreme length outside is 548 feet, and the Gothic nave (284 feet) is the longest of its kind in the world. A feature of interest is the substructure of the shrine of St. Alban, pieced together from 9,000 fragments. The abbey gate-house, which alone remains of the monastic buildings, was converted from a jail in 1869 to the use of the grammar school. St. Albans is historically interesting from the two battles fought here during the wars of the Roses in 1455 and 1461. Straw-plaiting, boot-making, and silk-manufacture are carried on. Pop. (1891) 12,895. R. A. ROBERTS.

**St. Albans**: town (settled in 1763); capital of Franklin co., Vt.; on the Central Vt. Railroad; 3 miles E. of Lake Champlain, 32 miles N. of Burlington, 70 miles S. of Montreal (for location, see map of Vermont, ref. 2-B). It is picturesquely situated on a plain 375 feet above lake-level and 390 feet above sea-level, is surrounded by high hills, and is the center of a large agricultural and dairying region. It contains 8 churches, high school, public graded school, academy, 2 convents, public library, hospital, a home for children, a national bank with capital of \$100,000, a trust company with capital of \$50,000, and a daily, a weekly, and a monthly periodical. The town is principally engaged in making butter and cheese, contains the headquarters of the Central Vermont Railroad, with offices, car and machine shops, and two roundhouses, and has manufactories of iron and steel bridges, viaducts, turn-tables, iron roofs, and marble and granite monuments. In 1864 the town was raided by a band of Confederates from Canada, and in 1866 was the rendezvous of Fenian invaders of Canada. Pop. (1880) 7,193; (1890) 7,771.

**St. Andrews**: town; in Fifeshire, Scotland; on a rocky plateau adjoining St. Andrews Bay; 42 miles N. N. E. of Edinburgh (see map of Scotland, ref. 10-1). The schools of St. Andrews were noted as early as 1120; and in 1411 the university, the first in Scotland, was founded. It has a museum, and a library with over 100,000 volumes. St. Andrews contains ruins of a cathedral (1160), a bishop's palace (1200), and many Celtic and prehistoric remains. It is a popular watering-place, and widely known as the headquarters of golf. Pop. (1891) 6,853. See *St. Andrews*, by Andrew Lang (London, 1893).

**St. Andrews**: a port of entry; capital of Charlotte County, New Brunswick; at the mouth of St. Croix river; on Passamaquoddy Bay; 66 miles by land W. of St. John; on the Canadian Pacific Railway (see map of Quebec, etc., ref. 6-G). It has a good harbor, a weekly newspaper, a marine hospital, a custom-house, a postal savings-bank, and various public buildings. It is an attractive place of summer resort. Pop. 1,800.

**St.-Césaire**, sǎn'sǎ'zǎ': town of Rouville County, Quebec, Canada; on Yamaska river; 33 miles E. of Montreal (see map of Quebec, etc., ref. 5-B). It has a large trade, a fine water-power, thriving manufactures, an astronomical observatory, a museum of mineralogy and zoölogy, and is the site of Sts. Croix College, a commercial school, and a Presentation convent. Pop. of parish, 5,200, almost all French-Canadians.

**St.-Chamond**, sǎn'shǎ'mōn': town; in the department of Loire, France; at the confluence of the Gier and Ban; 7 miles by rail N. E. of St.-Étienne (see map of France, ref. 6-G). It has several silk-mills, iron-works, and manufactures of ribbons and lace. The vicinity contains rich coal mines. Pop. (1891) 14,599.

**St. Charles**: city; Kane co., Ill.; on the Fox river, and the Chi. and N. W. and the Chi. Gt. West. railways; 8 miles S. of Elgin, 38 miles W. of Chicago (for location, see map of Illinois, ref. 2-F). It is on both sides of the river, which furnishes good water-power, and contains foundries and machine-shops, malleable iron-works, manufactories of butter, cheese, flour and feed, and paper, a private bank, and a weekly newspaper. Pop. (1880) 1,533; (1890) 1,690.

**St. Charles**: city (settled in 1780, incorporated as a town in 1809, chartered as a city in 1849); capital of St. Charles co., Mo.; on the Missouri river, and the Burlington Route, the Mo., Kan. and Tex., and the Wabash railways; 20 miles N. W. of St. Louis (for location, see map of Missouri, ref. 4-J). The main business street extends along the river front, and the residence portion lies on and beyond a hill that rises a short distance back from the river. The river is here spanned by an iron railway and highway bridge 6,535 feet long, with approaches, completed in 1871, cost \$1,750,000. St. Charles contains 9 churches, several public schools, Roman Catholic and Lutheran parochial schools, Lindenwood College for young ladies (Presbyterian, opened in 1830), Sacred Heart Academy (Roman Catholic, opened in 1818), St. Charles College (Methodist Episcopal, South, chartered in 1838), 4 libraries with about 11,000 volumes, a national bank with capital of \$50,000, 2 savings-banks with combined capital of \$100,000, and 2 daily and 5 weekly newspapers. There are 3 large flour-mills, a grain elevator with storage capacity of 50,000 bush., a tobacco-factory with annual capacity of 1,000,000 lb. of manufactured goods, 2 breweries, extensive car-works, brick-works, large corn-cob pipe factory, and other industrial plants. Pop. (1880) 5,014; (1890) 6,161; (1895) estimated, 8,000. J. H. ALEXANDER.

**St. Christopher**: See St. Kitts.

**St. Clair**: city (settled in 1828); St. Clair co., Mich.; on the St. Clair river at the mouth of the Pine river, and on the Mich. Cent. Railroad; 12 miles S. of Port Huron, the county-seat, 45 miles N. E. of Detroit (for location, see map of Michigan, ref. 7-L). It is in an agricultural region, has ferry connection with Courtwright on the Canadian side of the river, and contains 6 churches, 3 public schools, Ladies' Library Association, Walker system of water-works, completed in 1886, a savings-bank with capital of \$50,000, and a weekly newspaper. The manufactories include salt-works, brick-yards, breweries, iron-works, planing-mill, sash, door, and blind factory, foundry, tannery, and ship-yards. Pop. (1880) 1,923; (1890) 2,353; (1894) estimated, 2,500.

EDITOR OF "REPUBLICAN."

**St. Clair**: borough; Schuylkill co., Pa.; on Mill creek, and the Penn. and the Phil. and Reading railways; 3 miles N. of Pottsville (for location, see map of Pennsylvania, ref. 5-H). It has 10 churches, 4 public-school buildings, a parochial school, improved water-works, electric lights, electric railway to Pottsville, and 2 weekly newspapers, and is principally engaged in mining and shipping anthracite coal and manufacturing mining apparatus. Pop. (1880) 4,149; (1890) 3,680; (1895) estimated, 4,500. EDITOR OF "SPLINTERS."

**St. Clair**, ARTHUR: soldier; b. at Thurso, Caithness, Scotland, in 1734; was grandson of the Earl of Rosslyn; educated at the University of Edinburgh; entered the British army as an ensign May 13, 1757; served under Amherst at the taking of Louisbourg July 26, 1758; became a lieutenant Apr. 17, 1759; was distinguished under Wolfe at Quebec; resigned his commission Apr. 16, 1762; settled in Ligonier Valley, Pa., 1764, erecting there a fine residence and several mills; was appointed colonel of the Second Pennsylvania Regiment Jan. 3, 1776; accompanied Sullivan in the expedition against Quebec; was appointed brigadier-general Aug. 9, 1776; joined Washington Nov., 1776; ren-

dered valuable service in connection with the battle of Princeton Jan. 2, 1777; was for a short time adjutant-general; was appointed major-general Feb. 19, 1777; succeeded Gates in command at Ticonderoga Apr. 1; was forced to evacuate that post July 4, thereby incurring unpopularity and retirement from his command, but acted as a volunteer aide at the battle of Brandywine Sept. 11, 1777; was acquitted with honor by a court martial in 1778; was a member of the court martial on Maj. André; commanded at West Point from Oct. 1; distinguished himself in the Southern campaign which terminated at Yorktown, and subsequently in that under Greene; was a member of the Continental Congress 1785-87, being its president during most of the latter year; became first Governor of the Northwestern Territory in 1789 and retained the office till 1802; made the treaty of Fort Harmer with the Indian tribes 1789; became commander-in-chief of the U. S. army Mar. 4, 1791; made an expedition against the Indians of the Miami and the Wabash, and suffered a severe defeat near the Miami villages Nov. 4, 1791; was vindicated from blame by a committee of investigation appointed by Congress; resigned the command of the army May 5, 1792; was removed from the post of Governor by Jefferson Nov. 22, 1802, when he settled near Greensburg, Pa., where he passed his remaining years in poverty. D. near Greensburg, Aug. 31, 1818. He published a *Narrative of the Manner in which the Campaign against the Indians in the Year 1791 was conducted* (1812). See *The Life and Public Services of Arthur St. Clair* (Cincinnati, 1882).

**St. Clair, Lake**: the smallest of the Laurentian chain of lakes; receives the overflow of Lake Huron through St. Clair river, and discharges through Detroit river into Lake Erie. The lake is 30 miles in length from N. to S., 24 miles in maximum and 12 in mean breadth. Its area is 396 sq. miles, and its mean elevation above the sea 576 feet, or 5½ feet lower than Lake Huron and 3 feet higher than Lake Erie. Its mean depth over a large central area is about 19 feet. Its bottom is of fine blue mud, covered in many places with a thin layer of sand and fine gravel, and is overgrown throughout with vegetation which supports an abundance of low forms of life. The northern part is exceedingly shallow, being filled with sediment from St. Clair river. See ST. LAWRENCE RIVER AND GULF. ISRAEL C. RUSSELL.

**St. Clair River** [originally named *Sinclair*, from Patrick Sinclair, a British officer, who purchased land along the river from the Indians in 1765]: the outlet of Lake Huron. It has a length of 41 miles, and a fall of 5½ feet. The mean discharge is 225,000 cubic feet per second. The river has built a low-grade delta at its mouth, known as the St. Clair Flats, and divides into seven principal channels before reaching Lake St. Clair. In summer the delta has the appearance of a luxuriant prairie of grasses and rushes, which grow in a few inches of water. Several hotels and hundreds of summer cottages have been built on the flats, each house being supported on piles or on embankments formed by dredging neighboring canals. It is one of the most charming summer resorts in America. One of the branches into which the stream divides has been improved for navigation, and its course shortened by the dredging of a canal about 14 miles long, 300 feet wide, and with an original depth of 16 feet along a central area 200 feet broad. The embankments on either side are 40 feet wide, and 5 feet high above mean water-level. The available depth of water in the canal in 1893 was 18 feet, but contracts have been awarded by the U. S. Government for deepening it to 20 feet, this being one of the improvements necessary to complete the navigability of the route from Buffalo to Duluth for vessels of 20 feet draught. ISRAEL C. RUSSELL.

**St.-Cloud**, sǎn'kloo': town; in the department of Saône-et-Oise, France; on the Seine; 6 miles S. W. of Paris (see map of France, ref. 8-F). It derives its name from St. Cloud, grandson of Clovis, who founded a monastery here in 551. The place was burned by the English in 1358, and again by the Armagnacs in 1411. In the palace of St.-Cloud, built in 1572, Henry III. was assassinated in 1589; and here the *coup d'état* of Nov. 10, 1799, which placed Napoleon Bonaparte at the head of the French Government, was effected. The capitulation of Paris in 1815 was signed here, and also the decrees of Charles X. in 1830 which caused the second Revolution. The Duke of Orleans, brother to Louis XIV., made extensive additions to the royal chateau. In 1870 the palace was seriously injured by fire, but many of the valuable works of art were preserved. Pop. (1891) 5,660.

to ascend. In 1891 an elevation of 14,500 feet was reached on its northern slope. Consult *Report on Second Expedition to Mt. St. Elias in Thirteenth Ann. Rep. U. S. Geol. Surv.* ISRAEL C. RUSSELL.

**Ste.-Marguerite**: See LÉRINS, THE.

**Ste.-Marie**: town of Beauce County, Quebec, Canada; on the river Chaudière; 80 miles S. of Quebec (see map of Quebec, ref. 4-D). It lies in a fertile region, has a fine Roman Catholic college, a spacious convent, a good trade, a large number of mills, and ores of copper and manganese. Pop. about 2,800.

**Sainte-Maure**: See BENOÎT DE SAINTE-MORE.

**Saintes, sânt'** (anc. *Mediolanum*): town; in the department of Charente-Inferieure, France; on the Charente; 28 miles by rail S. E. of Rochefort (see map of France, ref. 6-D). It has several interesting Roman remains, numerous breweries, distilleries, tanneries, and potteries, and an active trade in grain, hemp, leather, and wine. Pop. (1891) 13,363.

**St.-Étienne, sânt'â-ti-en'**: town; in the department of Loire, France; on the Furens, an affluent of the Loire; 86 miles by rail S. W. of Lyons (see map of France, ref. 6-G). It is situated in the center of rich coal-fields, from which over 3,000,000 tons are annually raised, and which have given to the city a most vigorous manufacturing impulse. It arose in an astonishingly short time; it had 49,614 inhabitants in 1851, and 122,769 in 1891. Its principal branches of manufacture are ribbons and firearms; looms, some of which (1895) are driven by electricity, employing about 40,000 persons are in operation, and produce ribbons to the value of nearly \$19,000,000 annually, which are sent all over the world, and are unsurpassed in beauty of design and colors; 20,000 persons are employed in the ironworks, and produce, besides large quantities of cutlery, files, nails, etc., nearly all the rifles and revolvers for the army. The first railway in France, the Chemin de Fer de St.-Étienne à Lyon, was constructed to carry coal to Lyons.

**St. Eusta'tius**: an island of the Lesser Antilles, West Indies; crossed by lat. 17° 29' N.; area, 7 sq. miles. It is little else than the summit of an extinct volcano, and has no running water. It now forms part of the Dutch colony of Curaçoa. Pop. (1892) 1,633. H. H. S.

**Saint-Évremond**: See ÉVREMOND.

**St. Francis River**: one of the six great tributaries of the St. Lawrence. It rises in Lake St. Francis, in Beauce County, Quebec, flows first in a southwesterly direction till it reaches Lennoxville, when it flows northwesterly and falls into the St. Lawrence at Lake St. Peter after a course of 120 miles. It is the principal river of the Eastern Townships. The tributaries are the Salmon, the Coaticook, the Massawippi, which drains the beautiful lake of the same name, and the Magog, which drains the magnificently picturesque Lake Memphremagog. The river runs through a fertile and well-cultivated territory, diversified with highlands and tracts of woodland. The towns and villages upon the river's banks are Angus, with its large paper-mill; Lennoxville, with its university; Sherbrooke, with its extensive manufactures; Windsor Mills, with its lumber and paper trade; Richmond, an important railway center; and Drummondville, the center of a rich farming district. Its course is frequently interrupted by shallows and rapids, and destructive floods are often caused by the blocking of the ice on or near these in early spring. The scenery amid which the river flows resembles in many places the character of an English landscape, more particularly in the vicinity of Richmond and Sherbrooke. J. M. HARPER.

**St. Francis River**: a tributary of the Mississippi, forming part of the boundary between Missouri and Arkansas. It rises in the Iron Mountain district of Southwest Missouri, and flows S. W. 450 miles, entering the Mississippi near Helena, Ark.; is navigable 150 miles, passes through a continuous swamp after entering Arkansas, and spreads into numerous lakes, one of which, 50 miles long by 20 wide, is supposed to have been produced by a sinking of the soil at the time of the great earthquake of 1811. It serves as an important backwater in overflows of the Mississippi river.

Revised by M. W. HARRINGTON.

**St. Francis Xavier (zâv'i-er)**. College of: an institution of learning in New York, founded by the fathers of the Society of Jesus in Oct., 1847, and endowed with full collegiate powers by the regents of the University of the State of New York in Jan., 1861. The college buildings are located

on Fifteenth Street, W. of Fifth Avenue, with a frontage of 275 feet and a depth of 200, extending to Sixteenth Street. The library contains 25,000 volumes. The regular course preparatory to the degree of Bachelor of Arts embraces the study of logic, metaphysics, and theodicy; English, Latin, and Greek; rhetoric, poetry, and elocution; mathematics and the natural sciences; history, geology; and mythology. The degree of Master of Arts is given to graduates who enter the post-graduate class, pass two examinations in ethics and sociology, and write three creditable dissertations on the subject-matter of the year. The president of the college is Rev. Thomas E. Murphy, of the Society of Jesus, and the teaching staff includes twenty members of the same society. The students number over 900: 200 in the post-graduate course, 150 in the collegiate, 400 in the grammar department, and nearly 200 in the preparatory department.

EDW. P. SPILLANE, S. J.

**St.-Gall**: canton of Switzerland; bounded E. by the Rhine and N. by the Lake of Constance. Area, 779 sq. miles. The surface exhibits a thoroughly alpine character—mountains covered with forests, pastures, and snow and ice, and valleys studded with vineyards, orchards, and grain-fields. Agriculture, dairy-farming, and wine-making are the principal branches of industry. Pop. (1888) 228,174, of whom more than half are Roman Catholics and the rest mostly Protestants.

**St.-Gall**: capital of the canton of St.-Gall, Switzerland; on the Steinach, in a valley at an elevation of 2,152 feet (see map of Switzerland, ref. 3-I). It was formerly fortified, but its walls and ramparts have been transformed into promenades. The town has a fine cathedral, many good educational institutions, two large public libraries, and extensive manufactures of woolen, linen, and cotton fabrics, especially fine muslins and printed calicoes. Pop. (1888) 27,390.

**St. Gall**: a saint of the Roman Catholic Church; a native of Ireland, and a pupil of St. Columban; originally named Cellach or Caillech; b. in 554; followed St. Columban to Switzerland in 590, and became the apostle of the Suevi and the Alemanni. In 614 he built his cell in a dense forest on the Steinach, in Switzerland, where now stands the flourishing city of St. Gall, and gathered around him a number of hermits, who lived together according to the rule of St. Columban. D. at Arbon, 15 miles S. E. of Constance, Oct. 16, 627. From this beginning gradually developed the famous monastery of St. Gall, one of the principal centers of learning during the Middle Ages. Abbot Otmar, 720-759, substituted the milder rule of St. Benedict for that of St. Columban, built a church, founded a hospital, organized a school, etc. Under Gozbert, 816-837, the monastery was made a free royal abbey, with right to elect its own abbot, and exempted from any episcopal control. Under Solomon III., 891-920, the institution reached the culminating point of its prosperity. The monks of St. Gall were celebrated not only for their learning, but also for their skill in music, in copying and ornamenting manuscripts, etc. The first check it suffered was the revolt of the city of St. Gall in 1415. The abbot was compelled to recognize its freedom and independence. After the Reformation it gradually fell into decay, but it retained its enormous revenues until the Revolution. It was secularized in 1798; its estates were confiscated, and its territory was formed into a bishopric. See Ildephons von Arx, *Geschichte des Kantons St. Gallen* (3 vols., St. Gall, 1810-13); Franz Weidmann, *Geschichte der St. Gallen'schen bibliothek St. Gallens* (1841); C. J. Greith, *Der heilige Gallus* (1865); and the edition by R. Shuli of Walafrid's original life of St. Gall (1890). Revised by S. M. JACKSON.

**St. George**: one of the PRIBILOF ISLANDS (q. v.) in Bering Sea. It is triangular, 30 miles around, with an area of 27 sq. miles. It is the highest of the group, reaching an elevation of 920 feet. M. W. H.

**St. George, Cape**: See CAPE ST. GEORGE.

**St. George's**: See BERMUDA ISLANDS.

**St. George's**: capital of the island of Grenada and of the British colony of the Windward islands, West Indies, on a bay near the south end of the island (see map of W. Indies, ref. 9-M). The harbor is one of the best in the W. Indies; the town, built in part on hills, is very picturesque; it has a considerable trade with the other islands and with Europe and the U. S. Pop. about 6,000. H. H. S.

**St. George's Channel**: a body of water connecting the Irish Sea with the Atlantic and separating Ireland from Wales. It is 100 miles long and 65 miles broad.

[illegible]

**St. Helena**. A British island in the South Atlantic Ocean; lat. 15° 55' N. and lon. 7° 44' W. (far west — ramp of Africa). It lies off the west coast and 84 broad in length in area of 47 sq. miles. Pop. about 4,000. St. Helena was discovered by the Portuguese in 1502. The Portuguese navigator, on May 21, 1659, the *Hortense*, first carried unknown to other ships until 1660 when it was observed by Cape Verde ships. It remained uninhabited until the Dutch took possession in 1678. It was taken from the Dutch by England, but in 1810 the East India Company was granted a charter to govern it as its possession. In 1824 it passed into the hands of the crown. The only good inlet is St. James's Bay, 10 mi. S. W. of the island possessing a good harbor, where there is now a wharve and a built. Though 500 miles from the nearest land, Isle of Ascension, and 1,140 miles from the nearest port of the Atlantic continent, it is one of the best harbors in the world, so being the place of exile and of naval stores transportation. See Appendix I.

10. **Holbrook**—County, New Mexico, City on the S. Pac. Railroad; 10 miles S. of Gallup, 80 miles N. of San Francisco (for a description of Holbrook, see p. 63). It is a mountain town, noted for the extent and richness of its vineyards, and is chiefly engaged in grape growing and wine-making, and stock-raising. It is a R. P. town. Industry, a national bank, a post office of \$100,000, two State banks with combined capital of \$1,000,000 and a weekly newspaper. Pop. (1900) 1,200.

Walsingham, town in Cambridgeshire, England; 12 miles  
west of Ely, and 140 mi. S. W. of London, on the 7-11. 1916.  
The industrial town of collieries and textile facilities. St.  
John's Hospital, founded in 1854, is a great center of industry.  
The town is one of the largest of the manufacturing of  
the county, and has extensive alkali, copper,  
and iron works. A borough with a public library  
in 1854. Since 1854 St. John's has entered and  
been a part of the 1916. (1916) 11, 258.

St. Helier, capital of the island of Jersey, on its southern coast, is the port side of St. Aubin Bay (see map of Jersey, p. 100). It has a good harbor, is fortified and defended by two batteries and carries on its extensive trade, especially in fish.

Saint-Hilaire, George. See GEORGE SAINT-HILAIRE.  
Saint-Hilaire, Jean. See JEAN SAINT-HILAIRE.

Seit 1945 haben wir die Möglichkeit, die in der ersten Hälfte des Jahrhunderts

[illegible]

**At Howard les Halles** are found the ruins of the main building with thermal springs in the neighborhood of Nancy, France, within 3 ft. of the Moselle River bed, about 130 S. E. of Paris, and 3 ft. from the nearest railway station, Saint-James-Saint-Hippolyte. The thermal establishment contains five groups of waters with mineral sulphate in solution having temperatures from 50 to 75° F. Roman remains have been found in considerable abundance, proving that this is the ancient Aquæ Nervæ. Price about 1,700. M. W. H.

**St. Hyacinthe**, city, capital of St. Hyacinthe County, Quebec, Canada, on (east) French River and the river St. Lawrence and Black Rivers; 35 miles E. N. E. of Montreal and east end of Quebec, ref. 5-11. It occupies a Roman Catholic college and university, there is a hospital, manufacturing, four hotels, bridges, and numerous amusements. Among the fine buildings are the bishop's palace, city hall and courts. There is a fine view from the river and some fishing. Pop. (1911) 7,016, nearly all French Canadians.

St. Ignace: the largest of the islands in the extreme north of Lake Superior, separating Ingham Bay from the body of the lake, belongs to Ontario; area about 640 sq. miles, pop. about 200. It is separated from Black Bay Peninsula by a long passage less than a mile broad, but from 20 to 30 fathoms deep. Its highest elevation now has an altitude of 1,440 feet, and four basins.

M. W. H.

4 11 11

**St. Ignace**, city, capital of Mackinac co., Mich.; on the straits of Mackinac, and the Great S. Shore and Atlantic Railway, opposite Mackinaw City, 45 miles S. of Sault Ste. Marie (for location, see map of Michigan, ref. 2-1). It is from manufacturing and timber regions, has a taxicidal harbor, and is a terminal port for several lines of steamers and a part of rail for others. Six miles distant is the national park of Mackinac Island, a popular summer resort. The city contains four churches, of which the Church of St. Ignatius, founded by Jacques Marquette, is the oldest in Northern Michigan. It contains a famous and painting *St. Ignatius Remember Me* World. There are a graded high school, a Roman Catholic academy, a national bank with capital of \$500,000, and 2 weekly newspapers. The principal industries are those connected with iron mining and manufacturing and with lumbering. St. Ignace was the seat of an early fur-trading company, which was the nucleus of early exploring expeditions. Pop. (1880) 1044, (1890) 2,704.

1970-1971 - 16 years

**Saintlin, Alvin**, **James Rowland**; painter and portrait painter; b. at Issoud, France, Apr. 14, 1829; pupil of Delille, Prost, and Levaucher; medals, Salons, 1855 and 1870; cheyvalier of the Legion of Honor 1877; third-class medal, Paris Exposition, 1889. D. in Paris, July 24, 1894. He passed several years in the U. S. and painted, among other portraits, that of Stephen A. Douglas (1860). Two of his best-known works are *The Dog Lapins* (1861) and *Abolition* (1880). He painted the portrait of Madame Carnot, wife of the president of the French republic in 1891. His work is academic in style and without distinguishing qualities of color or drawing. W. A. C.

W. A. C.

**Salutine**, skatzen: the pseudonym of JOSEPH NASTIER. He was born in Paris, France, July 10, 1798. He published a volume of poems, several novels, and satire or in connection with Scriba, Duvet, Musset, and others about 200 plays. He is best known for the sketch *Peau de chagrin* which ran through forty editions, was translated into all European languages, and received the Montyon prize from the Académie. He died Paris, Jan. 21, 1867.

**St. Ives;** town; in the county of Cornwall, England; on St. Ives Bay 6 miles N. N. W. of Penzance (the town of England, ref. 15 B). It has a harbor, a pier, and a breakwater, and is the chief seat of the Cornwall potato-and-fishery. It is a famous watering-place. Pop. (1901) 6,014.

**St. Ives:** town in Huntingdonshire, England; on the coast, 5 miles E. of Huntingdon, see map of England, ref. 10-34. It has a parish church dating from the fifteenth century, and a second stone bridge, built by the abbots of Ramsey, with an abbey street in the middle. Pop. (1881) 3,407.

St. John d'Ante: St. Anne

**St. Jérôme**, station on a town of Terrebonne County, Quebec, Canada; on the Rivière du Nord, and a branch of the Canadian Pacific Railway; 34 miles S. W. of Montreal.

(see map of Quebec, ref. 5-A). It has a very fine water-power in the rapids of the river, which descend 300 feet in  $3\frac{1}{2}$  miles. The power is used for flour-mills, sawmills, and other factories. In the vicinity are mines of iron and plumbago. The climate is celebrated for its salubrity. Pop. (1891) 2,032, mostly French-Canadian. M. W. H.

**St. John, West Indies:** See ST. THOMAS.

**St. John:** the capital of Antigua, West Indies, and the seat of several military and civil authorities (see map of West Indies, ref. 6-L). It is beautifully situated and has a good and fortified harbor, which, however, is not accessible for large vessels. The town is generally well built, especially on the hills surrounding the port. It sometimes suffers greatly from lack of water, and it was seriously injured by the earthquake of Feb. 8, 1843. Pop. (1891) 9,738.

Revised by M. W. HARRINGTON.

**St. John:** city, seaport, and shiretown of St. John County, province of New Brunswick, Canada; on the St. John river at its entrance into the Bay of Fundy, and the Canadian Pacific, the Intercolonial and the Shore Line railways; 277 miles N. W. of Halifax, 481 miles E. of Montreal (for location, see map of Quebec, ref. 6-H). It has one of the finest harbors on the Atlantic coast, protected by a breakwater 2,250 feet long, and always free from ice. Partridge island, at its entrance, contains a fine lighthouse and a quarantine hospital. St. John river enters the harbor through a rocky gorge about 100 yards wide, and has a fall of 17 feet at low tide; but as the tides in the harbor rise from 25 to 35 feet, the waters of the river and harbor are at the same height twice daily, and then permit the safe passage of vessels either way. Including Carleton on the W. and the former city of Portland (annexed in 1889) on the N., the city has an area of about 6,000 acres, one-quarter of which is built up. It is laid out regularly with broad streets running N. and S. and E. and W., some of them hewn through 30 feet of solid rock, the principal ones laid with block pavement, the sidewalks generally being of asphalt. Water is supplied by gravitation from Little river, 5 miles distant. The plant is owned by the city, and in 1893 had cost \$1,327,421. The city has a thorough system of sewerage and gas and electric-light plants.

**Public Buildings.**—Among the notable buildings are the custom-house, post-office, city building, General Public Hospital, Provincial Lunatic Asylum, Protestant and Roman Catholic orphan asylums, Home for Aged Females, Sailors' Home, Wiggin's Orphan Asylum for sons of seamen, Reformatory for Boys, Free Public Library, Mechanics' Institute, Masonic and Odd Fellows' halls, Dominion Savings-bank, and the railway station.

**Churches, Schools, etc.**—St. John contains 35 churches and 81 schools. The finest church buildings are the Roman Catholic Cathedral, and the Centenary Methodist, Trinity Episcopal, St. Andrew's Presbyterian, and the German Street Baptist churches. The school system is public and non-sectarian, and is ably maintained. The Victoria, Centennial, and Albert schools, the Mt. Pleasant Convent School (Roman Catholic), the Davenport School for Boys (Church of England), and the Madras School are of high grade. A reference library is maintained by the St. John Law Society, and there are 5 daily, 7 weekly, and 2 monthly periodicals.

**Transportation.**—The gorge is spanned by a suspension bridge for vehicles, and by a steel cantilever bridge (opened in 1885) for railways. The Intercolonial Railway connects the city with all parts N. and E.; the Canadian Pacific with all parts W., including the valley of the St. John; and the Shore Line with St. Stephen and Calais. There is regular steamship connection with Prince Edward Island, Nova Scotia, Boston, the West Indies, and European ports. A system of electric street-railway connects all parts of the city.

**Business Interests.**—The city has excellent facilities for manufacturing. Ship-building, once a great industry, has almost ceased since the introduction of iron and steel in the construction of vessels. The chief industries are the manufacture of lumber, cotton goods, rolled iron, nails, nuts and bolts, engines and boilers, furniture, lead pipe, paint, carriages, and sashes and doors. The exports in the fiscal year 1892-93 were valued at \$3,943,867; the imports, \$3,596,969. The seagoing tonnage entered in 1893-94 was inward, 513,296 tons; outward, 510,359; coastwise, inward, 270,552; outward, 297,429. Banking facilities are afforded by the banks of New Brunswick, Nova Scotia, Halifax, Montreal, and British North America, and there is a Dominion bank for savings.

**Government and Finance.**—The city is divided into thirteen wards, and is governed by a mayor with a board of fifteen aldermen, all elected by the city at large. The city and county return three members to the Dominion House of Commons and six members to the Provincial House of Assembly. In 1893 the revenue from taxes was \$335,296, from other sources \$201,117; assessed value of real and personal property, \$24,256,700; debt, \$3,592,007; assets, \$4,051,804.

**History.**—The site was visited by de Monts in 1604; was occupied by the French as a fort under Charles de la Tour in 1635; passed under British rule in 1713 by the treaty of Utrecht; was settled by American loyalists, principally from New England, in 1783; and was incorporated by royal charter as a city in 1785. Pop. (1881) 26,127; (1891) 39,179.

ALFRED A. STOCKTON.

**St. John, sin'jūn or sānt-jon', HENRY:** See BOLINGBROKE.

**St. John, JAMES AUGUSTUS:** Orientalist and miscellaneous author; b. in Caermarthenshire, Wales, Sept. 24, 1801; acquired a good knowledge of languages, ancient and modern, including Arabic and Persian; was at an early age engaged as sub-editor of *The Oriental Herald*; started the *London Weekly Review* 1827; settled in Normandy 1829; traveled in Norway the same year; visited Egypt and Nubia, ascending the Nile to the second cataract; made several discoveries in physical geography and archaeology, including that of the site of the tomb of Osiris on the Sacred Isle; explored Lake Moeris; followed the (supposed) track of the Israelites through the Desert of Sinai; gave an account of this journey in his *Egypt and Mohammed Ali* (1834), *Description of Egypt and Nubia* (1844), and *Isis, an Egyptian Pilgrimage* (1853); wrote at Chantilly, France, *The Hellenes, or the Manners and Customs of Ancient Greece* (3 vols., 1842), in which he was assisted by his son Bayle; published *The Nemesis of Power* (1854); the *History of the Four Conquests of England* (2 vols., 1862); a *Life of Sir Walter Raleigh* (2 vols., 1868); several novels; two religious treatises, *Philosophy at the Foot of the Cross* (1854) and *The Preaching of Christ, its Nature and Consequences* (1855); a biography of Louis Napoleon, *Empire of the French* (1857); and a treatise on *The Education of the People* (1858). D. Sept. 22, 1875.

**St. John, sānt-jon', JOHN PIERCE:** Governor of Kansas; b. at Brockville, Franklin co., Ind., Feb. 26, 1833; went to California in 1853; made voyages to South America, Mexico, and the Sandwich islands; removed to Charleston, Ill., in 1860 to study law; fought in the civil war, and was made colonel; settled in Kansas as a lawyer; was elected Governor of that State in 1878, and re-elected in 1880; was the candidate of the Prohibition party for President of the U. S. in 1884.

**St. John, sin'jūn, PERCY BOLINGBROKE:** author; eldest son of James A. St. John; b. at Plymouth, England, Mar. 4, 1821; accompanied his father in his Eastern travels while a boy, and early devoted himself to literature; made a tour through the U. S., Texas, and Mexico about 1840; became Paris correspondent of *The North British Daily Mail* 1847; wrote the *Book of the War* (1853), for which he received the thanks of the Greek Parliament; wrote many novels and was a contributor to many magazines and literary periodicals. Among his best-known books are *The Young Naturalist's Book of Birds* (1844); *Three Days of the French Revolution* (1848); *Arctic Crusoe* (1854); *Quadrooma* (1861); *The Creole Bride* (1864); *The Snow Ship* (1865); *Good and Gold* (1870); *The North Pole* (1875); and *A Daughter of the Sea* (1884). D. Mar., 1889. Revised by H. A. BELLS.

**St. John, Sir SPENSER:** diplomatist and Orientalist; son of James A. St. John; b. in London, Dec. 22, 1826; devoted himself to Oriental literature; became proficient in the Malay language; was appointed secretary to Sir James Brooke, rajah of Sarawak (Borneo), in 1848; was secretary to Brooke's mission to Siam 1850; was acting British commissioner and consul-general in Borneo 1851-55; was full consul-general 1855-62; published *Life in the Forests of the Far East, comprising Explorations of the Interior of Borneo, Sarawak, etc., with Illustrations* (2 vols., 1862); went to Haiti as chargé d'affaires 1863, and visited Spain in 1866 with his father, whom he assisted at Simancas in researches preparatory to the publication of the latter's *Life of Sir Walter Raleigh*. He was appointed minister resident to Peru in 1881, and minister plenipotentiary to Mexico in 1884. He was the author of *The Life of Sir James Brooke* (1879) and *Haiti, or the Black Republic* (1884). Revised by H. A. BELLS.

Commercial Bank, established 1857, capital in 1893 \$306,000. All Government business was transacted through these banks. On Dec. 10, 1894, both were forced to suspend, causing heavy losses to shareholders and others, and creating a serious financial crisis, during which several of the oldest and most extensive mercantile establishments failed. They have since gone into liquidation, and three Canadian banks have opened branches in St. John's. The savings-bank is a Government institution, the Government controlling all its expenditures and the general revenue of the colony being liable for all its deposits. On Dec. 31, 1893, the amount of deposits was \$3,068,288.

**Transportation.**—The city is connected by rail with Harbour Grace, Placentia, etc. The Allan line of steamships call at St. John's on their outward and inward passages, carrying mails and passengers. The service is weekly during nine months of the year, and fortnightly during three. The city has also steamboat communication with the principal ports N. and S. Steamers of two lines, plying between Liverpool and Halifax and between New York, Halifax, and St. John's respectively, call at intervals of about ten days.

**Business Interests.**—The people are engaged principally in business connected with the fisheries, which form the staple industry of the colony. Seal-oil and seal-skins are exported mainly to Great Britain, and codfish to Great Britain, Spain, Portugal, Italy, Brazil, and the West Indies. On Jan. 1, 1892, there were registered at the port of St. John's 2,222 vessels, of 94,583 tons. The imports in the preceding year aggregated in value \$6,869,458, and the exports \$7,437,158. The export of codfish was 1,244,834 quintals, valued at \$4,864,525. The number of sailing vessels clearing from St. John's for the seal-fisheries was once very large, but these have been superseded largely by steamers. There are several sawmills, machine-shops, iron-foundries, furniture-factories, breweries, tobacco-factories, tanneries, and boot and shoe, and rope, twine, and net factories.

**History.**—Since 1855, when a responsible Government was granted the colony, the progress of the city has been rapid and substantial. In 1846 the city was visited by a fire which destroyed three-fourths of the buildings, and on July 8, 1892, by another, which laid waste more than one-half of the city. Nearly 1,800 buildings of all kinds, many of them built of stone and brick, were destroyed, causing a total loss of about \$16,000,000, and two-thirds of the large mercantile establishments, with their stores, perished in the flames. Eleven thousand people were left homeless. The portion of the business part of the city which had been destroyed was rebuilt on a larger scale, and much finer shops and offices than the old sprang up. Pop. (1891) 29,007. M. HARVEY.

**St. Johns:** *chef-lieu* of St. Johns County, Quebec; on the west bank of the Richelieu, and on the Grand Trunk, Canadian Pacific, and Vermont Central railways; 27 miles S. E. of Montreal (see map of Quebec, ref. 6-B). The principal manufacture is earthenware goods. There is also a silk-factory. The river trade includes exports of lumber and grain from the Lake Champlain district. The place is of some note in connection with the war of 1812, and near the barracks and military school there are still to be seen the remains of old fortifications. The river is spanned by three bridges, which connect Iberville with St. Johns. Pop. (1891) 4,722. J. M. HARPER.

**St. Johns:** village; capital of Clinton co., Mich.; on the Detroit, Gr. Hav. and Mil. Railway; 22 miles N. of Lansing, 98 miles W. N. W. of Detroit (for location, see map of Michigan, ref. 7-1). It is in an agricultural region, and contains sawmills and grist-mills, foundry, carriage-shop, and one of the largest table-factories in the world. There are 2 State banks with a combined capital of \$85,000, a national bank with capital of \$100,000, a Ladies' Library Association, and 3 weekly newspapers. Pop. (1880) 2,370; (1890) 3,127; (1894) State census, 3,440. EDITOR OF "CLINTON REPUBLICAN."

**St. Johnsbury:** town; capital of Caledonia co., Vt.; on the Passumpsic river, and the Boston and Maine and the St. J. and Lake Champlain railways; 21 miles N. of Wells river, 34 miles E. N. E. of Montpelier (for location, see map of Vermont, ref. 4-D). It is noted for having the largest manufactory of scales and balances in the world, and contains also foundries, machine-shops, and agricultural-implementation works. Among the notable institutions are the St. Johnsbury Academy, built and endowed at a cost of \$200,000 by Thaddeus Fairbanks; the St. Johnsbury Athenaeum, built and provided with a library of 10,000 volumes and an art gallery by Horace Fairbanks; and a museum of natural

science. The town has 2 national banks with combined capital of \$700,000, 2 savings-banks, and 2 weekly newspapers. Pop. (1880) 3,360; (1890) 3,857; (1895) town and village, estimated, 7,100. EDITOR OF "CALEDONIAN."

**St. John's College:** an institution at Annapolis, Md. It originally existed as an institution of learning under the name of King William's School, which was founded in the year 1696, so that the continuity of its history would place it immediately after Harvard in regard to age. In 1784 the funds and library of the school were transferred to the infant college by special charter, and its name was changed to St. John's. It was formally opened Nov. 11, 1789. Among those who were active in promoting the welfare of the college in its infancy are to be found Rev. John Carroll, the first Roman Catholic archbishop of America, and the Rt. Rev. T. J. Claggett, Protestant Episcopal Bishop of Maryland. The college is non-sectarian, but receives a large share of its patronage from the Protestant Episcopal body. In Oct., 1894, there were about 190 students in attendance. The president is Thomas Fell, Ph. D., LL. D., and there are fifteen members in the faculty. The college receives annually from the State of Maryland about \$15,000 for its support. It also has a small endowment. THOMAS FELL.

**St. John's Dance:** a name given to the medieval DANCING MANIA (q. v.).

**St. John's River:** a stream which rises in the swamps of Brevard co., Fla., and after a course of nearly 400 miles reaches the Atlantic. It is regularly navigated by steamboats to Enterprise, 230 miles from its mouth, and small steamers have ascended some 60 miles above that point. It has but a slight fall and a very gentle current. Its banks are clad in rich half-tropical verdure, and for nearly two-thirds of its course it is nowhere less than a mile in breadth, and often expands into spacious lakes. Its lower course is nearly parallel with the coast and about 20 miles from it. For nearly 100 miles from its mouth it forms a wide, sluggish sheet of water, more resembling a lagoon than a river, the distance from shore to shore in some places being fully 5 miles. It is fed by springs and by the sluggish overflow of swamps, and is but slightly influenced by freshets. After passing the bar at its mouth there is a depth of 14 or 15 feet to Jacksonville, 10 feet to Palatka, and 8 feet to Lake George. The minimum depth at mean low tide on the bar is 7 feet, with an average rise and fall of 5.4 feet.

Revised by ISRAEL C. RUSSELL.

**St. John's University:** an institution at Collegeville, Stearns co., Minn.; founded in 1857 by Very Rev. Demetrius Marogna, who was first president and died in 1869. It was chartered in 1857; empowered to confer university degrees in 1869; received from Leo XIII. in 1878 power to create doctors in theology, philosophy, and canon law; received title of university by act of Legislature 1883.

Revised by J. J. KEANE.

**St. Johnsville:** village; Montgomery co., N. Y.; on the Mohawk river, the Erie Canal, and the N. Y. Cent. and Hud. River and the West Shore railways; 64 miles W. N. W. of Albany (for location, see map of New York, ref. 4-1). It is in an agricultural and dairying region, and contains manufactories of agricultural implements, paper, pianos, and woolen goods, a national bank with capital of \$50,000, and a weekly newspaper. Pop. (1880) 1,072; (1890) 1,263.

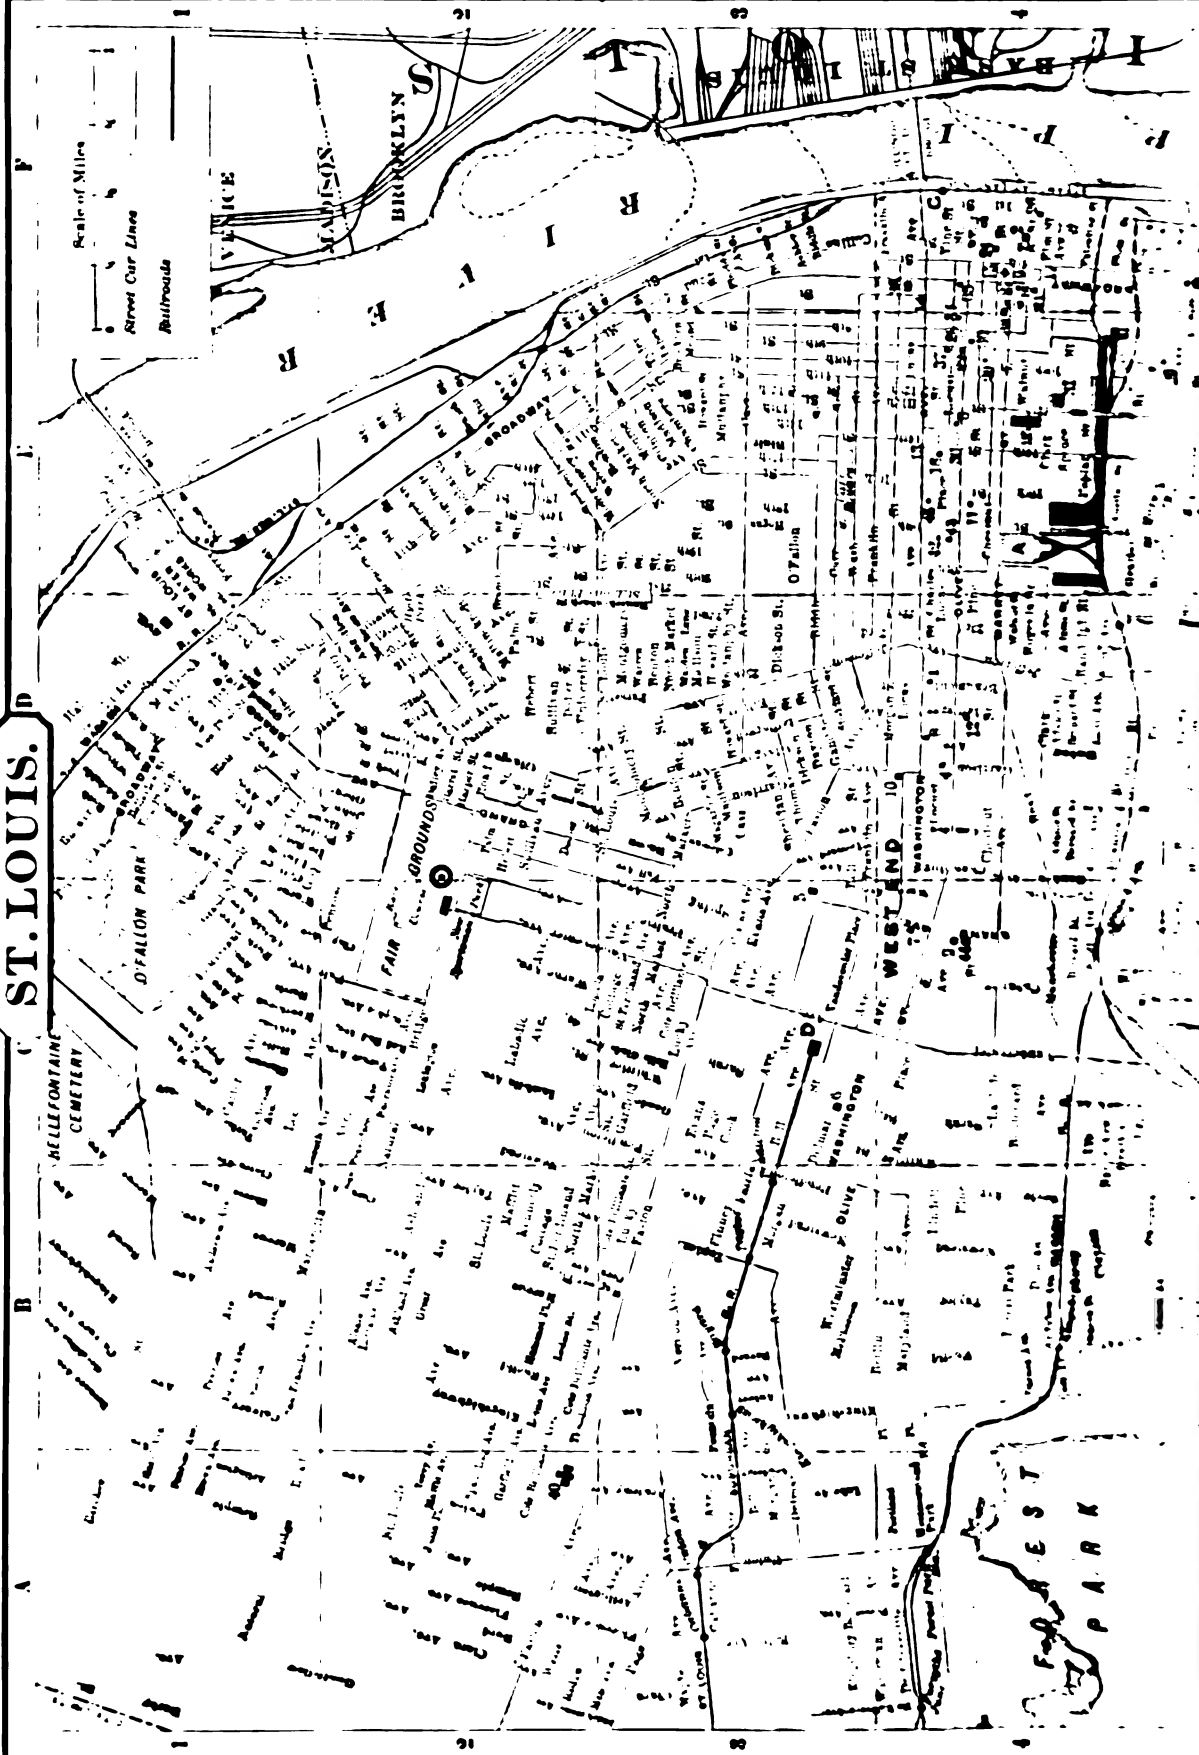

**St. John's-wort Family:** the *Hypericaceae*, a small group of 240 species of choripetalous, dicotyledonous herbs, shrubs, and trees. The flowers are regular and hermaphrodite, with five sepals, five petals, many hypogynous polyadelphous stamens, and a one-celled many-ovuled ovary with from three to five carpels. The leaves are opposite and punctate-dotted. The forty species of North America, some of which are showy, belong mainly to the genus *Hypericum*. The common St. John's-wort (*H. perforatum*) is a yellow-flowered perennial weed, naturalized in the U. S. from Europe, which is most difficult to eradicate from fields. C. E. R.

**St. Joseph:** island of the St. Mary's river, between Lake Huron and Lake Superior, belonging to Ontario and separated from the Canadian side by a narrow channel. It is about 45 miles long and half as broad, hilly, and fertile. It was early settled by French Canadians, and now contains a prosperous population of farmers and fishermen. There are three small towns, named St. Joseph, Hilton, and Pembroke, on the island. M. W. H.

**St. Joseph:** village; capital of Berrien co., Mich.; on Lake Michigan, at the mouth of the St. Joseph river, and on the

THE NEW YORK  
PUBLIC LIBRARY

ASTOR, LENOX AND  
TILDEN FOUNDATIONS.

of 28 representatives, one from each ward, and a board of public improvement, consisting of a president, a street commissioner, a water commissioner, a sewer commissioner, a park commissioner, and a harbor commissioner. The first three commissioners must be educated engineers. The bonded debt in Apr., 1894, was \$21,196,711.55; assessed valuation of real and personal property, \$310,841,850; rate of taxation for municipal purposes, exclusive of the tax to pay interest on the bonded debt, limited to 1 per cent.; total tax within old limits of city (1893) \$2.05 on \$100. In 1893 there were 26 banks in the city, which together had \$16,850,000 capital, \$8,739,918 surplus, \$11,732,062 time deposits, \$43,137,039 current deposits, and \$81,080,850 in loans, currency, bonds, stocks, and real estate. The clearings of the year aggregated \$1,139,014,291.

**Manufactures.**—The census returns of 1890 showed 6,148 manufacturing establishments, with a combined capital of \$140,775,392, employing 93,610 persons, paying \$53,165,242 in wages and \$122,010,805 for materials, and turning out products valued at \$228,714,317. The principal establishments, according to the value of products, were breweries, capital \$15,910,417, value of products \$16,185,560; tobacco-factories, capital \$3,894,320, products \$14,354,165; flour-mills and grist-mills, capital \$4,320,955, products \$12,641,000; slaughtering and packing houses, capital \$3,274,671, products \$12,047,316; foundries and machine-shops, capital \$10,184,926, products \$11,945,493; manufactories of men's clothing, capital \$5,765,150, products \$9,630,688; publishing houses, capital \$5,192,065, products \$8,551,249; shops for making and repairing steam-cars and street-railway cars, capital, \$2,453,443, products \$5,641,252; and manufactories of boots and shoes, furniture, carriages and wagons, paints, saddlery and harness, iron and steel, brick and tile, and lumber.

**Transportation.**—The trade of the city, which depended a long time upon navigation by river, received great impulse from new railway connections, and the deepening of the channel of the Mississippi at its mouth, so as to admit seagoing vessels of the largest size, gave St. Louis further importance as a receiving dépôt for much of the grain of the Northwest consigned to Europe. There are 25 trunk lines of railway, comprising 57,000 miles of track, entering the city. The receipts of freight by rail aggregated 10,133,448 tons in 1893, and the shipments 5,350,128 tons. The city also commands over 6,000 miles of direct navigation by river, accessible to steamers and barges during a large part of the year. St. Louis is an interior port to which foreign merchandise can be transported without appraisement at the port of original reception, and during the fiscal year ending June 30, 1893, it had imports valued at \$3,305,351. Transportation by rail is facilitated by five bridges across the Mississippi and Missouri rivers and by a Union Station in the city. The most noted bridge, as well as the most noted structure in the city, is the lofty steel viaduct across the Mississippi for railway and highway traffic, designed and built by James B. Eads. (See *ARCH AND BRIDGES, Arched Bridges*.) The Merchants' bridge, built of steel on the truss plan, and completed in 1890 at a cost of \$3,000,000, crosses the same river 3 miles above the Eads bridge, and the Bellefontaine bridge crosses the Missouri river just above its junction with the Mississippi, and connects with the Alton bridge across the Mississippi, furnishing a new approach from the N. and the E. The Union Railway Station is used by 21 railways, has a train-shed of steel and glass covering 30 tracks, each accommodating 8 full-length cars, and with its site cost \$6,500,000. Its electrical lighting plant furnishes 300 arc-lights and 5,500 incandescent lamps. Cupples Station, a regular railway station within the city and about a mile from Union Station, consists of seven tracks running into the center of a large block of buildings, in which eight of the largest commercial firms do business. The facilities for loading and unloading cars are perfect and the speed with which the work is done is remarkable. There are 2,000 trucks, capable of holding 2 tons each, in use, and hydraulic elevators carry them to all floors. During Sept., 1894, there were 330,000 tons of freight handled without the use of wagons.

**History.**—St. Louis was founded Feb. 15, 1764, by Pierre Liguette Laclède as a trading-post, and named in honor of Louis XV. of France. In 1765 it was made the capital of Upper Louisiana, with Saint-Ange de Bellerive as governor. Although subject to the authority of Spain by the treaty concluded at Paris in 1763, St. Louis was practically under French control, and remained so until formal possession was taken by Don Pedro Pierras, Nov. 29, 1770. The transfer

by France to the U. S. of the territory of Louisiana took place in St. Louis Mar. 9, 1804. The town was incorporated Nov. 9, 1809; the first brick building was erected in 1813; the first steamboat arrived Aug. 2, 1817; John Jacob Astor located the Western department of his company here in 1819; the town received a city charter in 1822; suffered fearfully from cholera in 1848; Carondelet was annexed to it in 1870; and the city was made independent of the county in 1875. During the civil war it was held for the Union through the foresight and courage of Gen. Nathaniel Lyon and Frank P. Blair. It was constantly occupied by troops, was a base of supplies for the army, and contained a large military hospital. The Western sanitary commission had its headquarters here, and at a single fair, lasting twelve days, \$554,591 was realized for the commission. Pop. (1880) 350,522; (1890) U. S. census, 451,770; local claim, 460,357; (1894) estimated, 595,500. CALVIN M. WOODWARD.

**St. Louis Series:** a division of the Subcarboniferous or Mississippian group of rocks, typically exposed at St. Louis, Mo., whence its name, but occurring as an important deposit of limestone, sometimes oolitic or brecciated, and passing into calcareous shale in Missouri, Iowa, Illinois, Indiana, etc. The rocks are commonly from 200 to 250 feet thick, and yield a great variety of invertebrate marine fossils. Spargen Hill, Ind., is noted for the abundance and variety of fossils there obtained from rocks of this group. See *Correlation Papers—Devonian and Carboniferous*, by H. S. Williams, Bull. No. 80 U. S. Geological Survey.

ISRAEL C. RUSSELL.

**St. Lucia:** an island of the British West Indies (Windward islands colony); one of the Caribbee group, N. of St. Vincent. Area, 248 sq. miles. It is of volcanic origin, mountainous, and has a crater which emits sulphur fumes and, rarely, flames. The scenery is very picturesque, the mountains assuming strange forms, and having their sides clothed with tropical forests. The soil of the valleys is very fertile; sugar and cacao are the principal products and exports. This is one of the islands infested by the poisonous fern-dance; the climate is somewhat insalubrious. St. Lucia was long disputed by the French and British; the latter have held it permanently since 1803. Pop. (1891) 43,706. Capital, Castries, with about 5,000 inhabitants. H. H. S.

**St. Malo, sán'ma'lo':** town; in the department of Ille-et-Vilaine, France; near the mouth of the Rance, on a small island in the English Channel; connected with the mainland by a causeway 650 feet long (see map of France, ref. 3-C). The harbor, which is perfectly dry at ebb-tide, has from 40 to 50 feet of water at flood-tide, is large and safe, and defended by fortifications both on the mainland and on the island. Fishing for cod and herring in the Channel, and for seals and whales in the Arctic Ocean, trading along the coast and to foreign ports, ship-building, and the manufacture of sailcloth, ropes, etc., are vigorously carried on. Pop. (1891) 9,227.

**Saint-Marc Girardin:** See GIRARDIN, FRANÇOIS AUGUSTE SAINT-MARC.

**St. Martin, sán'ma'rtán':** an island of the West Indies, in the Caribbee chain; crossed by lat. 18° 4' N. Area, 37 sq. miles. It is mountainous, but less than 1,400 feet high; is fertile and has a salubrious climate. By an arrangement originally made in 1648, this island is nearly equally divided between France and the Netherlands; the French portion (pop. in 1887 3,445) is a dependency of Guadeloupe; the Dutch portion, pop. (1892) 4,023, is attached to Curaçoa. H. H. S.

**Saint-Martin. ALEXIS:** See BEAUMONT, WILLIAM.

**Saint-Martin, LOUIS CLAUDE, Marquis de:** generally known under the name of LE PHILOSOPHE INCONNU, the name under which he published his writings; b. at Amboise, department of Indre-et-Loire, France, Jan. 18, 1743; served in the army until 1771, but afterward devoted himself to the study of theology and philosophy, especially the mystic Martinez, Pasqualis, Swedenborg, Jakob Böhme, and the dissemination of their teachings. He entertained very lofty views as to the incoming of a purely spiritual Christianity and as to the final restoration of all things through Christ. D. at Paris, Oct. 13, 1803. His writings, *Des Erreurs et de la Vérité, par un Philosophe inconnu* (Paris, 1775); *Tableau naturel des Rapports, qui existent entre Dieu, l'Homme et l'Univers* (1782); *Ecce Homo* (1796); *De l'Esprit des Choses* (1800); *L'Homme de Désir* (1790), etc., are all against sensualism and materialism. In France they made no great

**St. Paris:** village; Champaign co., O.; on the Ohio S., and the Pitts., Cin., Chi. and St. L. railways; 11 miles W. of Urbana, the county-seat, 15 miles E. of Piqua (for location, see map of Ohio, ref. 5-1). It contains a public high school, flour and planing mills, broom and carriage factories, a national bank with capital of \$52,100, and two weekly newspapers; and ships large quantities of grain, flour, lumber, and live stock. Pop. (1880) 1,099; (1890) 1,145; (1895) estimated, 1,400. **EDITOR OF "ERA-DISPATCH."**

**St. Paul:** the principal one of the Pribilof or Seal islands, in Bering Sea. It is the largest and the northernmost of the group, triangular in form. Area, 32 sq. miles. The highest point is Bogoslof, reaching about 650 feet above sea-level. Pop. about 300 Aleuts, devoted to the hunting of seals. The climate is severe. Potatoes and peas can be raised, and many swine are kept. **M. W. H.**

**St. Paul, Fr.** pron. sǎn'pôl': town of the French island of Réunion, on the western side of the island; has a good harbor and considerable trade. Pop. (of commune) 26,000.

**St. Paul:** city; port of entry; capital of the State of Minnesota and of Ramsey County; on both sides of the Mississippi; lat. 44° 52' 46" N., lon. 93° 04' 54" W.; 410 miles N. W. of Chicago (for location, see map of Minnesota, ref. 9-F). The city is mainly on the east bank of the river, and the two sections are connected by three substantial highway bridges. It is built on three plateaus, the lowest being the river flats; the second, the main plateau, on which the business portion and a part of the residence portion are built; and the higher, a range of irregular bluffs, on which are the principal residences. The city limits include 35,487 acres, within which lie the suburbs of Merriam, St. Antony, Union, Groveland, Macalester, and Desnoyer parks, Arlington Hills, and others. There are 45.49 miles of paved streets and 51 bridges, five of which cross the river, the others being built over ravines and tracks. The water-supply is obtained from a chain of lakes N. of the city, the daily consumption and supply being 8,000,000 gal.; length of conduit for water service, 4½ miles; sewers, 143.71 miles; water-mains, 227 miles. There are 24 parks, with a total of 450 acres, including Como Park,

State Capitol, St. Paul, Minn.

with 377 acres. The notable buildings are the State Capitol, city-hall, U. S. Government building (cost over \$800,000), Pioneer Press, Manhattan, New York Life, Germania Life, Globe and Endicott office buildings. There are 38 musical, literary, social, and sporting organizations, 10 libraries, and 56 newspapers and periodicals.

**Churches and Schools.**—St. Paul contains 167 churches: Lutheran, 28; Methodist Episcopal, 26; Roman Catholic, 21; Congregational, 18; Baptist, 18; Presbyterian, 17; Protestant Episcopal, 16; Evangelical, 5; Jewish, 5; People's, 3; Unitarian, 2; and one each, Christian, Christian Science, Gospel Tabernacle, Salvation Army, Spiritualist, and Swedenborgian. There are 44 public schools with 484 teachers and an enrollment of 19,000 pupils. The public schools include a large and finely equipped manual training-school and 26 public kindergartens. The total annual expense (1894-95) was \$451,500. There are 60 parochial and private schools, with an estimated enrollment of 8,000 pupils. The colleges are: Hamline University, for both sexes (Methodist

Episcopal, established in 1854), endowment \$175,000; Macalester College for both sexes (Presbyterian, incorporated in 1874), endowment \$200,000; St. Thomas's Seminary (Roman Catholic, established in 1885); St. Paul's Seminary (Roman Catholic, established in 1894), endowment \$500,000; and Concordia College (German Lutheran, established in 1894).

**Charitable Institutions.**—These include two Roman Catholic orphan asylums, Protestant orphan asylum, Roman Catholic Infants' Home, Protestant Babies' Home, Day Nursery, Home for the Aged, Home for the Friendless, House of the Good Shepherd (Roman Catholic), Woman's Christian Home, St. Paul Bethel, and the Friendly Inn. Other benevolent institutions and societies are: Board of Control, Children's Home Society, Needlework Guild, Newsboys' Home Association, Parish Settlement, Free Dispensary, St. Vincent de Paul Society, Hebrew Relief Society, Society for the Relief of the Poor, Society for Prevention of Cruelty, St. Mary's Home, Young Women's Friendly Association, City and County Hospital, Bethesda Hospital, St. Joseph's Hospital, St. Luke's Hospital, and the Homœopathic Hospital.

**City Finances.**—The total bonded debt, Jan. 1, 1895, was \$8,392,100, of which \$2,460,000 was for the city water system. The revenues of the water department are now sufficient to provide for future extensions, pay interest on these bonds, and provide a sinking fund for their redemption at maturity. The floating debt was \$235,000. The annual cost of the city government is about \$2,000,000; assessed value of real estate is \$119,094,861, of personal property \$15,242,448, and the annual tax-rate 2 mills on the dollar.

**Business Interests.**—The manufacturing establishment reported in the census of 1890 number 1,442 (distributed among 61 industries), representing an invested capital of \$22,501,211, employing 18,558 persons, paying \$10,373,339 in wages and \$15,865,573 for materials, and turning out products to the value of \$33,035,073. St. Paul does a large jobbing business (about \$150,000,000 annually), the available trade area, covering Minnesota, the Dakotas, Montana, Idaho, Washington, and Northern Oregon, being 582,164 sq. miles, with a population of 2,536,170. There are 22 banks, of which 5 are national, 5 savings, and 12 State; total capital, with surplus and undivided profits, \$8,527,615.

**Means of Communication.**—St. Paul is an important railway center, from which extend seven eastern trunk lines and four transcontinental systems. It is connected with the East and South by the lines of the Chicago, Milwaukee and St. Paul, Chicago and Northwestern, Burlington and Northern, Chicago and Great Western, Wisconsin Central, and Minneapolis and St. Louis, now part of the Rock Island system. The "Soo" line, through its relation to the Canadian Pacific, gives an outlet to the East independent of the Chicago systems. To the West connection is made with the Pacific coast over the systems of the Northern Pacific, the Great Northern, Canadian Pacific, and Union Pacific, in combination with the line of the Chicago, St. Paul, Minneapolis and Omaha. The St. Paul and Duluth, Eastern Minnesota, a part of the Great Northern system, and the Omaha have lines extending from St. Paul to the head of Lake Superior, and a very large part of the commerce between St. Paul and the East is conducted over the lake route. The city also has 103 miles of street-railway, electric and cable.

**History.**—The first house in St. Paul was built in 1841. The early settlers were principally French, and engaged in the fur and whisky trade. A Roman Catholic mission was begun in 1841, from which the city takes its name. The site was surveyed and plot recorded in 1847; the settlement was incorporated as a town and made the territorial capital in 1849, and became a city in 1854. St. Paul owes its early growth to its situation at the head of navigation on the Mississippi river. The assistance of the Federal Government has been secured in extending the navigable channel to Minneapolis, and a survey of practicable routes for a ship canal to connect the city with Lake Superior has been authorized by the Government. Pop. (1880) 41,473; (1890) 133,156; (1894) estimated, 180,000. **J. G. PYLE.**

**St. Paul:** city (founded in 1886); capital of Howard Co., Neb.; on the Loup Fork of the Platte river, and the Burlington Route and the Union Pac. railways; 23 miles N. of Grand Island, 174 miles W. of Omaha (for location, see map of Nebraska, ref. 10-F). It is in a grain-growing and stock raising region, and has 5 churches, a grammar school, several flour-mills, 3 national banks with combined capital of \$150,000, and 3 weekly newspapers. Pop. (1880) 482; (1890) 1,263; (1894) estimated, 1,500. **EDITOR OF "REPUBLICAN."**

principle of the St. Petersburg convention has been incorporated into later codes like that worked over by the Brussels Conference in 1874. The U. S. has never acceded to it. The obligations of this St. Petersburg Declaration are reciprocal only, so that its signatories if at war with the U. S. would not be bound by them. THEODORE S. WOOLSEY.

**St. Peter's Church**: See PETER'S, ST.

**St. Peter's Sandstone**: a deposit of friable white and yellow sandstone occurring principally in Wisconsin, but coming to the surface in the adjacent portions of Minnesota, Iowa, and Illinois; named from St. Peter's (now Minnesota) river, at the mouth of which it is well displayed. Its average thickness is from 80 to 100 feet, with a maximum of 212. It is one of the minor divisions of the rocks deposited during the Cambrian period; it rests on Lower Magnesian limestone and is overlaid by Trenton limestone. By many geologists it is considered as the equivalent of the Chazy of New York, but is probably more nearly equivalent to the basal member of the Trenton. Fossils are rare, and consist of tubes made by worms when the sands were soft, impressions of seaweeds, and shells of *Lingulepis*. It is an important source of artesian water. Consult *Geology of Wisconsin*, vol. i., by T. C. Chamberlin. ISRAEL C. RUSSELL.

**St. Pierre**, sǎn'pi-ār': principal town and port of the island of Martinique, French West Indies; on a bay of the west coast (see map of West Indies, ref. 7-N). It has no harbor, properly speaking, but the roadstead is protected by the island itself except during hurricanes, when its exposed position makes it very dangerous. The town is partly on low and somewhat insalubrious lands, partly on picturesque hills, where the residences are charmingly placed among trees and flowers. The botanical garden is one of the finest in the West Indies. Pop. about 20,000. H. H. S.

**St. Pierre**: town of the French island of Réunion, formerly Bourbon; in the Indian Ocean; on the southern shore of the island. It has a good harbor and a rapidly increasing trade. Pop. of commune, 24,500.

**Saint-Pierre**, JACQUES HENRI BERNARDIN, de: author; b. at Havre, France, Jan. 19, 1737; studied at first for the Church; went in 1750 to Martinique as a sailor, and on his return a few years later attended the school of engineering at Rouen, but in 1760 lost his position in the army on account of insubordination. After unsuccessful ventures at several employments he went to St. Petersburg, and was appointed a captain in the engineering corps of Finland, but failed to interest Catherine II. in his schemes of a model republic. Leaving the country in 1766 he fought against the Russians in Poland, inspired by a Polish princess; then again in Saxony against the Poles, to avenge himself on his former inspiration. After this he returned to France and received a position as an engineer in the Isle de France, but settled in 1771 in Paris and devoted himself to literature, associating much with Rousseau, who exercised a considerable influence both on his style and his ideas. He published in 1773 *Voyage à l'Isle de France*, etc.; in 1784 *Études de la Nature* (5 vols.), which gave him rank among the best French prose-writers; in 1788 *Paul et Virginie*, which became one of the most celebrated books of the age and was translated into all European languages; in 1790 *La Chaumière indienne* and *Le Café de Sarrate*; and subsequently many other works, none of which attained such success as *Paul et Virginie*; was made director of the botanical garden in 1792, Professor in Morals at the normal school in 1794; received a pension under the empire. D. at Eragry-sur-Oise, Jan. 21, 1814. Aimé Martin, who married his widow, published a collected edition of his works in twelve volumes in 1813-20; his posthumous works, letters, and a biography in 1833-36.

**St. Pierre and Miquelon**, -mek'lōn: a group of three islands and many islets at the mouth of the Gulf of St. Lawrence, near the south coast of Newfoundland, constituting a French colony; valuable only as a rendezvous for vessels engaged in the cod-fisheries, of which some 1,500 annually enter the port. Area, 91 sq. miles. Pop. (1889) 5,983. St. Pierre, the capital, has a population of 800.

**St.-Privat, Battle of**: See GRAVELOTTÉ, BATTLE OF.

**St. Quentin**, sǎn'kǎn'tān': town; in the department of Aisne, France; on the Somme; 95 miles by rail N. E. of Paris (see map of France, ref. 2-F); has extensive manufactures of cotton yarn, linen, tablecloths, lace, muslin, and gauze, besides large distilleries and soap-works. It contains an ancient Gothic church, and is surrounded by beautiful prome-

nades occupying the site of its old fortifications. Pop. (1891) 44,209. A battle took place here on Aug. 10, 1557, between the army of Philip II. of Spain, assisted by an English contingent, and the French, in which the French were defeated. During the Franco-German war, on Jan. 19, 1871, the Germans under von Goeben here defeated the French under Gen. Faidherbe; the former lost 3,000 men and captured 10,000 prisoners.

**St. Regis Falls**: village; Franklin co., N. Y.; on the St. Regis river, and the N. Adirondack Railroad; 22 miles S. W. of Malone, the county-seat (for location, see map of New York, ref. 1-I). It has excellent water-power, large lumber trade, several manufacturing, and a weekly newspaper. Pop. (1880) not in census; (1890) 1,210.

**St. Roque, Cape**: See CAPE ST. ROQUE.

**Saint-Saëns**, sǎn'sas'sǎn'. CHARLES CAMILLE: organist and composer; b. in Paris, France, Oct. 9, 1835. He showed a remarkable aptitude for music in his childhood, and made rapid progress under his teachers; entered the Conservatory in 1847, obtained second organ prize in 1849, and first in 1851; composed his first symphony when sixteen years old; in 1853 became organist of the Church of St. Merri, and in 1858 organist of the Madeleine, which post he resigned in 1877. He has composed largely in almost every art-form. Among his operas *Le Timbre d'Argent*, *Étienne Marcel*, *Henry VIII.*, *Ascanio*, and *Phryné* may be specially noticed, as also *Samson et Dalila*, a sacred cantata. He has written four very popular symphonic poems for full orchestra, entitled respectively *Le Rouet d'Omphale*, *Phaëton*, *Dances Macabre*, and *La Jeunesse d'Hercule*. D. E. H.

**Saintsbury**, GEORGE EDWARD BATEMAN: critic and literary historian; b. at Southampton, England, Oct. 23, 1845. He graduated at Oxford in 1867; was classical master in Elizabeth College, Guernsey, 1868-74, and head master of the Elgin Educational Institute 1874-76. Among his publications are a standard *Primer of French Literature* (1880) and *Short History of French Literature* (1882); a life of Dryden (1881) and of Marlborough (1885); *A History of Elizabethan Literature* (1887) and several volumes of selections, translations from the French, etc. H. A. BEERS.

**Saints' Days**: in the calendar of the Church, days set apart for the special commemoration of any saint. In the Roman Catholic Church the number of saints is very great, and a considerable number of saints are commemorated on each day of the year; but it is the custom to assign to particular countries, districts, or dioceses a certain number of saints for special commemoration. These saints' days constitute the calendar for that district. Any day not a saint's day in the local calendar, and not a festival nor a Sunday, is called a *feria* or vacant day; other days are either holy days of obligation, doubles, semi-doubles, and simples, according to the solemnity of the occasion and of the service for the day. See the *Ordo*, published annually. J. J. K.

**St.-Servan**, sǎn'sǎr'vǎn': town of France; department of Ille-et-Vilaine; at the mouth of the Rance, opposite St. Malo (see map of France, ref. 3-C). It has two good harbors and an active commerce. It is fortified and much frequented as a watering-place. Pop. (1891) 9,670.

**Saint-Simon**, sǎn'sē'mōn', CLAUDE HENRI, Comte de: founder of French socialism; b. in Paris, France, Oct. 17, 1760. He received a military education and aided the American colonies in the Revolutionary war. Early conceiving the notion that a great destiny awaited him, he sought by every means to enlarge his knowledge of men and things by varied experience. He gave up the military career and proposed a scheme for a Dutch and French expedition against the British in the Indies, but neither this nor a subsequent project for connecting Madrid with the sea by a canal attracted the attention of the authorities. In the revolution he took no prominent part, but was imprisoned for nearly a year during the Reign of Terror. He speculated in the confiscated estates of the émigrés and realized a small fortune, but spent it all in little more than a year. An unhappy marriage, dissolved by the mutual consent of the parties, completed his experience. Reduced to absolute penury, he lived partly on the charity of his friends and partly on the precarious results of his literary work to which he now devoted himself. The title of his writings was *Lettres d'un Habitant de Genève* (1787). This was followed by several scientific and political writings which passed almost without notice. His characteristic views were first propounded in *L'Industrie* (1817) and further developed in *L'Organisateur* (1819); *Du Système*

**Sal Aëra'tus** [Mod. Lat., aerated salt; *sal*, salt + *aëratus*, Latinization of aerated, from Lat. *aër*, air]: a somewhat impure and imperfectly carbonated bicarbonate of potash, made by exposing a concentrated solution of neutral potassic carbonate to an atmosphere of carbon dioxide proceeding from fermentation or other source; hence the name. The finely granular form of the commercial article is probably a result of agitation during the absorption of the carbonic acid. Medicinally, a purer crystalline bicarbonate of potash is used, which is, or should be, fully charged with 2 equivalents of carbonic acid for 1 of potash. *Sal aëratus* was at one time extensively used as an article of domestic consumption, but has been chiefly displaced by the cheaper and better compound bicarbonate of soda, known as cooking-soda, sometimes as soda saleratus. Revised by IRA REMSEN.

**Sal'ahdin** (*Yusuf-ben-Ayub-Salah-ed-Din*): Sultan of Egypt and Syria; b. in 1137 at the castle of Tekrit, on the Tigris, of which his father, the Kurdish chieftain Ayub, was governor. His uncle Shir-koh in 1163 was sent by Nur-ed-din Mahmud, Sultan of Syria, to Egypt to reinstate the dispossessed Emir Shaour. Salahdin accompanied him, and in the subsequent campaign showed great courage and military ability. Shaour became suspicious of his protectors and joined the crusaders, but was defeated and beheaded. Thereupon Shir-koh became governor of Egypt as Nur-ed-din's representative and on his death was succeeded by Salahdin, who manifested remarkable capacity as a civil ruler. On the death of Nur-ed-din (1174) he became independent Sultan of Egypt, to which Syria was speedily added, his title to both being confirmed by the Caliph of Baghdad. The Christian knights in Palestine constantly violated their treaties, attacking and plundering the Mussulman caravans. To end these outrages Salahdin invaded Palestine and destroyed the Christian army at the battle of Tiberias (July 4, 1187), where the King of Jerusalem, Guy of Lusignan, was taken prisoner. The capture of Jerusalem followed (Oct. 8, 1187). The king and inhabitants were treated kindly, but the knights of the various orders were put to death as violators of their treaties. Excitement at the fall of Jerusalem caused the third crusade (1189), and after a siege of two years Acre was captured by the Christians. The contest between Richard Cœur de Lion and Salahdin was really a species of tournament, wherein the most brilliant exploits were performed on both sides, with little gain by either. A three years' truce was concluded (Sept. 2, 1192) whereby the coast from Tyre to Jaffa was ceded to the Christians. Salahdin died at Damascus, Mar. 3, 1193. His estates were divided among his seventeen sons and his brother Malck-el-Adil. His fame was deservedly great. Magnanimous and just, skillful and intrepid in war, judicious and far-sighted in civil affairs, the founder of a vast and wisely administered empire comprising Egypt, Syria, Mesopotamia, Palestine, and Arabia, he is the hero of Mussulman chivalry.

E. A. GROSVENOR.

**Sal Alem'broth**, or **Salt of Wisdom**: a compound of corrosive sublimate and sal ammoniac, once used in medicine, but now discarded.

**Salaman'ca** (Rom. *Salamantica* or *Elmantica*): town of Spain; capital of the province of the same name; on the right bank of the Tormes, which is here crossed by a magnificent bridge of twenty-seven arches (see map of Spain, ref. 14-D). It is surrounded with old walls, but several portions within the walls have been in ruins since the occupation of the city by the French in 1812. The streets are mostly steep, narrow, crooked, and dark, but they are often lined with lofty edifices most interesting in architectural respects. The university was founded in 1200. It is the first institution of its kind in Spain, and enjoys a high reputation all over Europe. Pop. (1887) 22,200.

**Salamanca**: a town of the state of Guanajuato, Mexico; on the river Lerma and the Mexican Central Railway; 34 miles S. of Guanajuato (see map of Mexico, ref. 6-G). It has manufactures of cotton cloths. Pop. about 10,000.

**Salamanca**: village; Cattaraugus co., N. Y.; on the Alleghany river, and the Erie, the Buffalo, Roch. and Pitts., the W. N. Y. and Penn., and the N. Y., Penn. and O. railways; 34 miles E. of Jamestown, 60 miles S. of Buffalo (for location, see map of New York, ref. 6-C). It contains 7 churches, union graded school with three buildings, 2 Roman Catholic schools, public-school library, sewerage, natural-gas and electric-light plants, gravity system of water-works, 2 national banks with combined capital of \$100,000, 2 weekly news-

papers, railway-shops, sole-leather tannery, 4 saw and planing mills, 3 cigar-factories, 2 grist-mills, wire-mattress factory, foundry, and embroidery-factory. It was incorporated as a village in 1878. Pop. (1880) 3,498; (1890) 3,692; (1894) estimated, with suburbs, 5,500.

EDITOR OF "CATTARAUGUS REPUBLICAN."

**Salamander** [viâ O. Fr. from Lat. *salamandra* = Gr. *σαλαμάνδρα*; cf. Pers. *samander*, salamander]: any one of numerous forms of tailed amphibians, especially the species of SALAMANDRIDÆ (q. v.). These are small and of lizard-like form, and are terrestrial as distinguished from the aquatic newts of the same family. They inhabit damp, shady places, and feed mostly on worms, slugs, snails, insects, etc. *Salamandra maculosa* is the common spotted salamander of Central and Southern Europe. The black salamander (*S. atra*) is Alpine, and in this species the larvæ attain the air-breathing stage within the body of the mother. The salamander has been popularly identified with the fabulous animal of that name formerly supposed to be able to live in or to extinguish fire. The salamander of Marco Polo was a shrew. The animal locally known in the southern parts of the U. S. by the name is a pocket-gopher (*Geomys tuza*), a rodent.

**Salamanderidæ** [Mod. Lat., from Lat. *salamandra*, salamander. See SALAMANDER]: an Old World family of amphibians of the order URODELA (q. v.), including the typical salamanders and newts. They have posterior palatine processes, with teeth on their inner margins; the parapsylepharyngeal toothless; no post-frontosquamosal arch or ligament; and opisthocœlian vertebræ.

**Sal'amis** (modern *Kolours*): Greek island; in the Gulf of Egina; 8 miles W. of Athens. Area, 36 sq. miles. Pop. (1889) 6,254. It is arid, rocky, mountainous, and well wooded; produces cotton, olives, and wine. The village of Ambelaki occupies the site of the ancient city of Salamis. In the strait, hardly over a mile in width, between Salamis and Attica, the Greeks under Euribiades utterly defeated the Persian fleet (Oct. 20, 480 B. C.). E. A. G.

**Sal Ammoniac**: See AMMONIA.

**Salamistone**: See CORUNDUM.

**Salaverry**, *sāl-lā-er-ree'*, FELIPE SANTIAGO, de; soldier; b. at Lima, Peru, May 3, 1806. He was a student at Lima, and with several classmates ran away and joined the patriot army in 1821; served through the revolution; was lieutenant-colonel under Lamar; headed revolts against Gamarra 1833, and was general of division in the campaign against him 1834; declared against Orbegoso Feb. 23, 1835; seized Lima, and proclaimed himself supreme chief of Peru. In the confused condition of affairs most of the people of the republic adhered to him. Orbegoso invoked the aid of Santa Cruz, president of Bolivia, who marched into Peru. Salaverry was defeated, captured, and shot at Arequipa, Feb. 19, 1836. He was a brilliant and popular leader and a writer of some note. H. H. S.

**Saldanha Oliveira e Daun**, *sāl-daan'yā-ō-lē-vā i-nū ā-down'*, JOÃO CARLOS, Duke of Saldanha; statesman and soldier; grandson of the Marquis of Pombal; b. at Lisbon Nov. 17, 1791; fought against the British and was taken prisoner, but was soon permitted to join the Portuguese court at Rio de Janeiro, where he served in the army and held important official positions. When Brazilian independence was declared he returned to Portugal, and afterward as a moderate constitutionalist and supporter of Dom Pedro took part in the war against Dom Miguel. At first unsuccessful, he was again forced to leave the country, but returned in 1832, and after repeated successes received the capitulation of Dom Miguel at Evora 1834. He became Minister of War and president of the council May 31, 1835, but resigned in November of the same year. Having taken part in the unsuccessful conservative revolution of 1836, he lived abroad until recalled by the queen in 1846. In the following year he formed a ministry; was replaced by the second dictatorship of Costa Cabral 1849; overthrew the administration by force of arms 1851; conducted the government until the accession of Pedro V. (1856), when he came again the head of the opposition; was minister at Rio 1862-64, and again 1866-69; went to Paris as minister Mar. 1869; instigated a revolution in the palace May 19, 1870, the consequence of which he again became Prime Minister, but resigned in August, and was sent to London, where he died Nov. 21, 1876. F. M. CORRY.

**Sale** (of goods): the transfer by the seller of the general property in goods to the buyer, pursuant to contract, for

the delivery of the goods to the buyer, or to a third person for transmission to the buyer. If such appropriation is unconditional, and the goods conform to the order, property passes. But the seller may appropriate the goods conditionally. In such case property does not pass until the imposed conditions are fulfilled. For example, the seller may take a bill of lading of the goods in his own name, attach thereto a draft for the purchase price, and require payment of the draft as a condition of the buyer's acquiring the property. Where the condition is expressly imposed the rights of the parties are clear. Frequently the language and acts of the parties are equivocal, and the question whether the seller intended to appropriate the goods absolutely to the contract or to reserve to himself the right to their disposal becomes a difficult one. This is exemplified by the case of *The Calcutta Company vs. De Mattos* (32 *Law Journal*, Queen's Bench 322; 33 *ibid.* 214), the judges of the lower court being equally divided as to the intention of the parties, and, on appeal, two of the judges entertaining a third view.

Where a contract is made for the manufacture and delivery of an article, the property therein does not pass, according to the English decisions and those of many of the U. S., until delivery and acceptance, or until the article is ready for delivery and approved by the buyer. In some of the States it is held that the buyer assents in advance to the appropriation of the finished article to the contract, and that title passes upon the seller's tendering it.

Whether a contract for the sale of a part of a larger bulk of goods, of uniform kind and quality—e. g. 1,000 bush. of wheat from a grain elevator, or 100 gal. of oil from a tank, or 50 barrels of flour from a car-load—is one for a present sale of specific goods, or one for the sale of goods thereafter to be ascertained, is a question upon which the authorities are divided. The English view, which has been adopted in many of the U. S., is that the contract can not be more than an agreement to sell, and that property can not pass until the portion contracted for has been separated from the bulk. It is said there is no individuality until it is divided; the law knows no such thing as a floating right of property, which may attach itself either to one parcel or the other, as may be found convenient afterward. (*Golder vs. Ogden*, 15 Penn. St. 528.) On the other hand, it is maintained by many State courts that the subject-matter of such a contract is ascertained or specific goods, where it is a designated quantity out of a specified mass of uniform quality (*Kimberly vs. Patchin*, 19 N. Y. 330); and that the property in such designated quantity will pass, upon making the contract, if the parties so intend. This doctrine seems to accord with commercial usage. In some States it has been adopted wholly or in part by statute. See Mass. Pub. Stat., c. 72, § 7.

**Risk of Loss.**—This, unless otherwise agreed, passes from the seller to the buyer with the property in the goods, without regard to their possession. If delivery has been delayed through the default of either buyer or seller, the goods are at the risk of the party making default as regards any loss which would not have occurred but for such default. Sale of Goods Act, § 20.

**Transfer of Title.**—At common law a person can give no better title to goods than he possesses, unless he acts as the true owner's agent, or unless the true owner's conduct respecting the goods has estopped him from denying such person's authority to sell them. (See *ESTOPPEL*.) In England this rule does not apply to sales in MARKET OVERT (*q. v.*), and there, as well as in most of the U. S., it has been modified by Factors' Acts and similar statutes. The chief feature of this legislation is the power it confers on agents or consignees, who are intrusted by the owner with goods or with documentary evidence of title thereto, such as a bill of lading, warehouse certificate, delivery order, or the like, to give a perfect title to *bona-fide* purchasers. See *Lee vs. Buller* (1893), 2 Queen's Bench 318; *Goodwin vs. Mass. Company*, 152 Mass. 189; *Soltau vs. Gerdau*, 119 N. Y. 380, applying such legislation.

As delivery is not necessary to the transfer of ownership of goods, it should follow that one who has sold goods to A can not give title to them to B, although they are allowed by A to remain in his possession. Such is the general rule. In a few of the U. S. the courts have held that a seller who has never delivered the goods to the first purchaser may confer a perfect title upon a second *bona-fide* buyer. (*Ituschle vs. Morris*, 131 Ill. 587.) The adoption of this doctrine in the British Sale of Goods Act, § 25, is "the result of a long struggle between the mercantile community

on the one hand and the principles of the common law on the other."

We have seen that the owner of goods may deliver them under a contract that the title shall remain in him, and the performance of some condition by the buyer, such as the full payment of the price. Here the common law does not recognize any power in the conditional vendee to possess any greater interest than he possesses. (*Harkness vs. Kersell*, 118 U. S. 663.) A different rule has been declared by the Pennsylvania courts, and statutes have been passed in many jurisdictions requiring contracts for conditional sale to be in writing and recorded, in order to be effectual against the buyer's creditors and *bona-fide* vendees.

**Seller's Duties.**—The most important is that of delivery. If the contract specifies the time, place, and manner of delivery, its terms must be followed. In the absence of agreement or custom, the seller must deliver the goods upon payment or tender of the price; the place of delivery is the seller's place of business, or residence, or their place of deposit at the time, according to the subject-matter of the sale; or, if the seller is to send the goods to the vendee at a distance, the place of their receipt by the common carrier of delivery must be made at a reasonable hour; the exact quantity agreed upon must be delivered. Any expense incidental to putting the goods into a deliverable state must be borne by the seller. He is also bound, when delivering goods to a carrier on behalf of the buyer, to make a reasonable contract for their transportation, and to give accurate directions for their delivery to the buyer. If the buyer has not had an opportunity to inspect the goods, the seller must afford him a reasonable opportunity for inspection so that he may ascertain whether they are in accordance with the contract.

**Buyer's Duties.**—The buyer is bound to accept and pay for the goods, and, if the terms of the contract require, he must send for them. While the buyer is under no obligation to accept a different quantity of goods from that which he ordered, if he does accept it he must pay therefor at the contract rate. In case the buyer rightfully rejects goods tendered to him by the seller, he is under no duty to return them; he need only inform the seller of his rejection. The courts have experienced much difficulty in some cases in determining whether the buyer has accepted the goods. Perhaps no better rule can be framed on this subject than the one laid down in the British Sale of Goods Act, § 35: "The buyer is deemed to have accepted the goods when he intimates to the seller that he has accepted them, or when the goods have been delivered to him, and he does any act in relation to them which is inconsistent with the ownership of the seller, or when, after the lapse of a reasonable time, he retains the goods without intimating to the seller that he has rejected them."

**Seller's Remedies.**—If the property in the subject-matter of the sale contract has passed to the buyer, or if the buyer has agreed to pay the price on a day named, the seller can maintain an action for the purchase price. In other cases the buyer's breach of his contract will give the seller the right to maintain an action for damages for refusal to accept and pay for the goods. (See *DAMAGES, MEASURE OF*.) According to English decisions, the refusal of the buyer to take and pay for goods, the property in which has passed to him, does not divest him of such property, unless by the terms of the contract such a result is stipulated for, and with slight modifications such is still the rule under the Sale of Goods Act (§§ 39 and 48). The doctrine which generally obtains in the U. S. is as follows: "The vendor of personal property, in a suit against the vendee for not taking and paying for the property, has the choice ordinarily of either one of three methods to indemnify himself: (1) He may store or retain the property for the vendee, and sue him for the entire purchase price; (2) he may sell the property, acting as though for this purpose of the vendee, and recover the difference between the contract price and the price obtained on such resale; or (3) he may keep the property as his own, and recover the difference between the market price at the time and place of delivery and the contract price." (*Dustan vs. McAndrew*, 44 N. Y. 72.) Other remedies of the seller are discussed under *STOPPAGE IN TRANSITU (q. v.)*.

**Buyer's Remedies.**—These are an action for damages for breach of the seller's contract, or for *CONVERSION (q. v.)*, or for *SPECIFIC PERFORMANCE (q. v.)*.

Other topics connected with sales of personal and real property are presented in the articles on *DEED* and *FRANCHISE STATUTE OF (q. v.)*.

Some of the reasons I am glad with this anniversary of the 100th birthday of the Republic of the Philippines are the following: First, it is the first time that the people of the Philippines are united in a common purpose, and this is a very important step in the development of the country. Second, it is the first time that the people of the Philippines are united in a common purpose, and this is a very important step in the development of the country. Third, it is the first time that the people of the Philippines are united in a common purpose, and this is a very important step in the development of the country.

**Salix eriantha** Salisb. or *Salix eriantha* (Lam.) of Retz is hardly, except in a district of the same name in the Principality of Montenegro, in the Lower course of an mountain of 1,500 feet above sea-level, some sort of *S. laevigata* (L.) Ehrh. The former has a rather small and a well built and has important differences in the characters of the leaves. Page (1901) 67, 210. M. W. B.

**Salmon** city, capital of Harrison co., Ill.; on the Bigg, and  
Chas. & S. W. Rivers; 10 miles S. E. of Coatsburg, 71 miles  
E. of St. Louis. This location, on Bigg of Illinois, and Bigg.  
It is in an agricultural and manufacturing section, grows,  
respectively some of the largest quantities of fruit, and supplies  
a market here with capital of \$30,000, and thousands  
more. Pop. (1890) 1,647. (1900) 1,647. (1910) 1,647.

**Salem**, town, capital of Washington co., Ind., on the Kentucky, New Albany and Cincinnati R.R.; 35 miles N. N. W. of New Albany; other locations are camp of Leitchsburg, etc. 10-12 ft. It is on a gravelly river, has quantities of native limestone. It possesses 2 printing offices, steam-tannery, and cloth-factory, and comprises a flourishing high school, 2 private and free buildings, 1 United States bank, water works, a saw-mill, a flour mill, a State bank with capital of \$25,000; a private bank, and 2 weekly newspapers. Pop. (1880) 1,015; (1890) 1,075; (1900) estimated, 1,500.

**Salem**, city, chief county seat of Platte Co., Mo., on Missouri River, and the Boston and Maine Railroad; 10 miles S. E. of Boston; this location, on trip of Mississippi, Feb. 1-12. It is on a peninsula between two arms of the river with an excellent deepening the North or New channel; so irregularly laid out, but compactly built, and has a commodious, sheltered harbor, which is a refuge for coasting vessels in storms. There are two public parks—Washington Square, of 9 acres, in the center of the city, and The Wilsons, of 120 acres, 2 miles E. on the New State. The city is a modern Mecca for historical pilgrims and antiquaries, and an important center of trade and shipping for a large district which is connected by an elaborate system of electric street railways. It contains many fine residences, two court-houses, a U. S. custom-house, an incinerator to Heston's Sewer Letting City-hall, jail, water-supply from Wendon Lake, 4 miles distant, and gas and electric-light plants.

*Churches and Schools.*—Sweden has 21 churches: 4 Lutheran, 4 Evangelical, 3 Baptist, 3 Roman Catholic, 2 Protestant Episcopal, 2 Methodist Episcopal, and one each Swedish, German, Friends, Universalist, and Advent. The public school system comprises 4 State normal schools for girls, 2 high schools, 6 grammar schools, 12 primary schools, 4 kindergartens, 2 evening schools, and a drawing and an industrial school. In 1904 there were 5 public-school pupils, except of 4,554 pupils, and the cost of maintenance was \$905,000. There are a large Roman Catholic parochial and many private schools.

*Charitable and Beneficial Institutions.*—With the exception of the city almshouse and the administrative expenses of the public library, all scientific, literary, and charitable institutions are maintained by private trust- and subscriptions. The city holds in addition trust funds for charitable and educational purposes, amounting to \$119,000. The principal institutions are a free hospital, Old Men's Home, Old Ladies' Home, two homes for children, a farm school for boys, a Woman's Friend society, and the Fin-  
*Finch*

*Structure and Ranking.*—The public expenditure in 1936 was \$72,120; in 1937, \$110,000, the assessed valuations.

\$28,360,000, of which \$16,463,000 was on real estate; and the net debt, Jan. 1, 1895, was \$1,100,523. There are 7 national banks with combined capital of \$2,000,000, 2 savings-banks with combined deposits of \$12,000,000, and 8 mutual insurance companies.

**Business Interests.**—Salem merchants early established fishing industries; in 1670 sent vessels to the West Indies and Europe; and immediately after the Revolutionary war opened trade with China, India, Java, Sumatra, the Philippine islands, Arabia, Cape of Good Hope, Russia, South America, and other foreign parts. For many years the city was noted for its large foreign trade, and at one time had almost the monopoly of the East India and China trade; but it no longer has a foreign commerce. There is a large coasting trade, and an immense tonnage of coal is here landed for transshipment to interior cities. The manufacturing industries comprise a cotton-mill with 160,000 spindles, a lead-factory, and several tanneries, machine-shops, and shoe-factories.

**Notable Buildings.**—There are a few buildings typical of the period of 1634–1700. The public library (established in 1889) contains 29,000 volumes; the Essex Institute (society established in 1848) has a library of 40,000 volumes, and 100,000 pamphlets on science, art, local history, and music, a large collection of historical relics and portraits, and the frame of the Puritan meeting-house of 1634; the Peabody Academy of Science has a museum of ethnology (including an East India marine museum dating from 1799) and zoology, and special collections of Essex County zoology, botany, and archaeology; and the Athenæum has a library of 20,000 volumes.

**History.**—Salem was settled by Roger Conant and the "Old Planters" in 1626. Endicott, with a second charter, came in 1628. Banished by the magistrates, against the wishes of his people, Roger Williams went from Salem to settle Rhode Island in 1636. In 1692, as the result of the witchcraft delusion in Salem village (Danvers), nineteen persons were hanged by order of the court, appointed by the royal governor, sitting in Salem. Here, too, the awakening first occurred, and in 1693 all convicted and accused persons were set free. In the Revolution the first provincial assembly sat here in 1774; the first armed resistance to British authority (Leslie's Retreat) occurred at the North bridge Feb. 26, 1775; and Salem furnished large numbers of troops and 158 armed privateers. The U. S. frigate *Essex* was built in Salem in 1799. In the war of 1812–15, 40 of the 250 American armed vessels went from Salem, and in the war of 1861–65 the city furnished 3,000 men and gave 200 lives to the Union cause. Pop. (1880) 27,563; (1890) 30,801.

JOHN ROBINSON.

**Salem:** city (founded in 1854); capital of Dent co., Mo.; on the St. L. and San Fran. Railway; 127 miles S. W. of St. Louis (for location, see map of Missouri, ref. 6–I). It is in an agricultural, stock-raising, and iron-mining region; and contains 7 churches, Salem Academy, 5 roller-process flour-mills, 3 steam planing-mills, several sawmills, 2 State banks with combined capital of \$40,000, and 4 weekly newspapers. Pop. (1880) 1,624; (1890) 1,315; 1895 estimated, 2,000.

EDITOR OF "MONITOR."

**Salem:** city; capital of Salem co., N. J.; on the Salem river, and the W. Jersey Railroad; 14 miles S. E. of Wilmington, Del., 34 miles S. W. of Philadelphia (for location, see map of New Jersey, ref. 6–B). It is in a rich agricultural region, has regular steamboat communication with Philadelphia, and contains 13 churches, high school, several public schools, Friends' School, public library (founded in 1804), 4 hotels, 2 national banks with combined capital of \$250,000, and 3 weekly newspapers. There are 6 canneries for fruit and vegetables, 3 iron-foundries, 3 manufacturing of glass, machine-shops, mills, hosiery, and hollow-ware and oilcloth factories. Pop. (1880) 5,056; (1890) 5,516.

W. H. CHEW, EDITOR OF "STANDARD."

**Salem:** village; capital of Washington co., N. Y.; on the Delaware and Hudson Railroad; 25 miles S. of Whitehall, 41 miles N. E. of Troy (for location, see map of New York, ref. 4–K). It is in an agricultural, dairying, and slate-quarrying region, is a popular summer resort, and contains Washington Academy (opened in 1791), St. Paul's Hall (Protestant Episcopal, opened in 1885), Raleigh School, 2 national banks with combined capital of \$100,000, 2 weekly newspapers, cheese-factory, several mills, and railway repair-shops. Pop. (1880) 1,410; (1890) not separately returned; (1894) estimated, 1,400.

**Salem:** city (founded by Moravians in 1766); Forsyth co., N. C.; on branches of the Norfolk and Western and the Southern railways; adjoining Winston, the railway station and banking-place; 112 miles W. of Raleigh (for location, see map of North Carolina, ref. 2–F). It was the center of important movements in the early Indian and the Revolutionary wars, and was visited by Union and Confederate armies in the war of 1861–65. It is the seat of Salem Female Academy (Moravian, founded in 1802), which retains its original name, although it has become one of the leading colleges for women in the Southern States and has collegiate and post-graduate courses, schools of music, art, and languages, and commercial and industrial departments. The manufacturing industries comprise cotton and woolen mills, tobacco-factories, and iron-works. Pop. (1880) 1,340; (1890) 2,711; (1894) estimated, 4,000 to 5,000. JOHN H. CLEWELL.

**Salem:** city; Columbiana co., O.; on the Salem and the Penn. railways; 70 miles W. of Pittsburgh, Pa. (for location, see map of Ohio, ref. 3–J). It contains 7 churches, 3 graded public schools, a public high school, 2 national banks with combined capital of \$300,000, 2 private banks, 2 daily and 2 weekly newspapers, and manufacturing of machinery, engines, sheet-iron, church-organs, wire nails, pumps, stoves, furniture, and other articles, art-works, church-furniture works, tile-works, and brick-works. Pop. (1880) 4,041; (1890) 5,780; (1893) 7,320. EDITOR OF "DAILY NEWS."

**Salem:** city; capital of the State of Oregon and of Marion County; on the Willamette river, and the Southern Pac. Railroad; 53 miles S. of Portland (for location, see map of Oregon, ref. 3–C). It is in an agricultural and fruit-growing region; is laid out with streets 100 feet wide, and blocks 330 feet square, with 16-foot alleys; and is one of the handsomest cities on the Pacific coast. It has communication with Portland twice a day by railway and once a day by steamboat. Water for manufacturing purposes is brought to the city from the Willamette and Santiam rivers by a canal 18 miles long. In 1890 over \$1,000,000 was invested in manufacturing industries, which included several large flour-mills, a woolen-mill, foundries and machine-shops, tanneries, tobacco-factories, plants for fruit-drying and canning, carriage and wagon factories, brick-kilns, and agricultural-implement works. The city contains 2 public parks, 20 churches, a public high school and 5 grammar schools, a State, a Masonic, and 2 educational libraries, Willamette University (Methodist Episcopal, opened in 1844), the Academy of the Sacred Heart (Roman Catholic, opened in 1860), a Friends' Institute (opened in 1892), 2 national banks with combined capital of \$175,000, an incorporated bank, 2 private banks, and 4 daily, 4 weekly, and 2 other periodicals. The reformatory and charitable institutions comprise the State Penitentiary, Reform School, Deaf Mute School, Institute for the Blind, Insane Asylum, and Orphans' Home. The city is an important business center, and is very progressive. A Methodist mission was established 9 miles below the present city in 1834; the city was incorporated in 1853, and became the State capital in 1860. Pop. (1880) 2,538; (1890) 4,515; (1895) estimated, 15,000.

S. T. RICHARDSON.

**Salem:** town; capital of Roanoke co., Va.; on the Roanoke river, and the Norfolk and Western Railroad; 60 miles W. by S. of Lynchburg, 180 miles W. by S. of Richmond (for location, see map of Virginia, ref. 6–E). It is in an agricultural and tobacco-raising region, is the seat of ROANOKE COLLEGE (*q. v.*), has good water-power, and contains a graded public school, a national bank with capital of \$75,000, a State bank with capital of \$67,300, a loan and trust company with capital of \$50,000, and a weekly and a monthly periodical. Pop. (1880) 1,759; (1890) 3,279.

**Saleratus:** See SAL AERATUS.

**Saler'no:** chief town of the province of Salerno, Italy; 33 miles by rail S. E. of Naples, on the Gulf of Salerno (see map of Italy, ref. 7–F). The chief object of interest is the old Norman cathedral (1084), injuriously restored in 1768, but still the most imposing specimen of Norman architecture in Southern Italy, and containing, besides rich marbles and mosaics, twenty-eight magnificent granite and porphyry columns from the temples of Paestum. Tradition asserts that the body of St. Matthew was brought from the East in 930 and deposited in the crypt of the cathedral. Salerno was originally a Roman colony; it became the capital of a principality in the ninth century, and in 1077 it was taken by Robert Guiscard, who made it his capital. The

adult the following skeletal peculiarities may be mentioned: Ribs as a rule are lacking, their place being taken by the transverse processes of the few (usually ten) vertebrae. The caudal vertebrae have been replaced by a bony rod (urostyle). The skull is very complex; the ethmoid bone is in the shape of a girdle (*os en ceinture*) around the cerebrum, and the quadrato-jugal arch is usually complete. Teeth never occur in the lower jaw, and they may be lacking from the upper one. Pectoral and pelvic girdles are always present, and the two halves of the former may either be firmly united or they may play one over the other, differences seized upon by Prof. Cope to divide the otherwise homogeneous order into two subdivisions. The skin is naked (i. e. without plates or scales), but it is not infrequently "warty," from the presence of large defensive glands which secrete an acrid fluid. In all except a few tropical forms a tongue is present, and is used in capturing the prey, which consists to a large extent of insects.

Some of the *Salientia* are aquatic (frogs), some (toads) are terrestrial, going into the water only for the purpose of oviposition in the spring, and still others (tree-toads) live in trees and bushes, and have the tips of the toes modified into sucking-disks to insure a firm hold upon the branches upon which they dwell. All of the *Salientia* have vocal organs, but these are most exercised at the time of reproduction. Most interesting are some of the reproductive habits. The eggs are laid in gelatinous strings or masses, usually deposited freely in the water. In the case of the obstetrical toad of Europe the male wraps the egg-strings around himself. In the members of the genus *Nolotrema* of South America the skin of the back becomes folded into a sac in which the eggs are carried until hatched. In the Surinam toad (*Pipa*) the eggs are received upon the back of the male, the skin of which grows up around the separate eggs until each is inclosed in a cup and covered with a lid of skin. In these cups the eggs develop until they have obtained the adult form, when they escape to begin free life.

None of the *Salientia* is marine. Their great home is in the tropics. The typical toads are especially developed in tropical America, Africa, and Asia; the true tree-frogs and related forms are most abundant in Australia and tropical America; and the typical frogs are most numerous in tropical Asia and Africa, while they are entirely excluded from Australia. Comparatively little is known of their geological history, but frogs and toads have been found in the Upper Eocene of Europe.

LITERATURE.—Ecker, *Anatomie des Frosches* (1864-82); Boulenger, *Catalogue of the Batrachia Salientia in British Museum* (London, 1882); Cope, *Batrachia of North America* (1889). J. S. KINGSLEY.

**Saligenin:** See SALICIN.

**Salina:** city; capital of Saline co., Kan.; on the Smoky Hill river, and the Atch., Top. and S. Fé, the Chi., Rock Is. and Pac., the Mo. Pac., and the Union Pac. railways; 47 miles W. of Junction City, 118 miles W. of Topeka, the State capital (for location, see map of Kansas, ref. 5-G). It derives power for manufacturing from the river, has 5 grain elevators, flour-mills, paper-mills, and planing-mills, foundry and machine shops, gas, water, and electric-light plants, and street-railways, and contains 16 churches, 5 public schools, Kansas Wesleyan University (Methodist Episcopal, chartered in 1885), Normal University, St. John's School (Protestant Episcopal), 3 national banks with combined capital of \$250,000, a State bank with capital of \$50,000, and a daily, 5 weekly, and 3 monthly periodicals. There are valuable salt-springs and gypsum-quarries in the vicinity. Pop. (1880) 3,111; (1890) 6,149; (1894) 5,541.

EDITOR OF "REPUBLICAN JOURNAL."

**Salina Group:** an American geological formation of Upper Silurian age, otherwise known as the Onondaga salt group. It consists of red and green shales and impure limestone, containing large masses of gypsum, and is best developed in Central New York, where it is about 1,000 feet thick and forms an east-and-west belt averaging about 10 miles broad, passing through Syracuse. It is the source of brine from which 8,000,000 to 12,000,000 bush. of salt are made annually. I. C. R.

**Salinan Indians:** a linguistic stock of North American Indians deriving its name from the Salinas river, California, in the main and tributary valleys of which, in Monterey and San Luis Obispo Counties, they formerly resided. It is represented by a single known tribe, the Chalone, whose villages were Aspasniagan, Chulare, Ekriagan, Eslanagan, Gocharone, Ichenta, and Yumanagan. These settlements supplied the

neophytes of the missions of San Antonio and San Miguel, established by the Spanish padres in 1771 and 1797 respectively. A large proportion of the natives connected with the Soledad mission, founded in 1791, also belonged to this family, and some of the Aspasniagan were neophytes of the mission of San Carlos.

In their general habits and customs the Salinan Indians resembled the Costanoan, Esselenian, Mariposan, and other southern Central California tribes. By Galiano, in 1792, they were described as of medium size, dark color, and as being the ugliest and filthiest of the natives of America. They led in part an agricultural and pastoral life. Their houses were circular and were constructed of stones or adobes and roofed with thatch.

Though the San Antonio and San Miguel tribes were probably never very populous, the missions bearing those names when first established contained respectively 1,400 and 1,200 Indians. In 1884 only a dozen Indians of the Salinan group were known to survive.

AUTHORITIES.—D. A. Galiano, *Viaje por las goletas Sutil y Mexicana en 1792* (Madrid, 1802); Alexander S. Taylor, *Indianology of California*, in *California Farmer* (San Francisco, 1860-63); H. H. Bancroft, *History of California*, vols. i.-vii. (San Francisco, 1884-90); H. W. Henshaw, *Missions of California*, in *Popular Science Monthly* (Aug., 1890); J. W. Powell, *Indian Linguistic Families*, seventh report Bureau of Ethnology (Washington, 1891). See INDIANS OF NORTH AMERICA. F. W. HODGE.

**Salinas:** city; capital of Monterey co., Cal.; on the Southern Pacific Railroad; 94 miles S. E. of San Francisco (for location, see map of California, ref. 9-C). It is in an agricultural, stock-raising, and wool-growing region, and has 6 churches, a public high school, 2 State banks with combined capital of \$420,000, 2 agricultural-implement factories, electric lights, and 2 daily and 2 weekly newspapers. Pop. (1880) 1,854; (1890) 2,339; (1895) estimated, 3,500.

EDITOR OF "JOURNAL."

**Salineville:** village; Columbiana co., O.; on the Penn. Railroad; 80 miles S. S. E. of Alliance, 63 miles W. N. W. of Pittsburg (for location, see map of Ohio, ref. 8-J). It is in a coal-mining region, and contains a private bank and a weekly newspaper. Pop. (1880) 2,302; (1890) 2,369.

**Salinometer:** a form of HYDROMETER (*q. v.*) for measuring the amount of salt in a given solution.

**Salisbury:** sawlz'berry, or New Sarum: capital of Wiltshire, England; in a valley near the confluence of the Avon, Bourne, Wily, and Nadder; 84 miles W. S. W. of London (see map of England, ref. 13-H). It has a magnificent cathedral, which is the purest and richest specimen of the Early English style. The main building was constructed 1220-58 in the form of a double cross. The cloisters and chapter-house were added in 1270, and the spire, the highest in England (400 feet), was erected about 1330; it leans over 2 feet toward the S. It is 449 feet long and 81 feet high in the interior; the length of the great transept is 203 feet. It was much damaged by injudicious restoration (1782-91), but this has been considerably remedied by a restoration begun by Sir Gilbert Scott in 1863, and continued afterward by Street and Sir Arthur Blomfield. Old Sarum (*Sorbidunum*), in Roman times a camp of importance, stood about a mile N. of the present city. It consists of a conical hill encircled with intrenchments. Salisbury returns one member to Parliament. Pop. (1891) 17,362. R. A. ROBERTS.

**Salisbury:** township (settled about 1720, organized in 1740); Litchfield co., Conn.; on the Housatonic river, and the Phila., Reading and New Eng. Railroad; 63 miles N. W. of Hartford (for location, see map of Connecticut, ref. 7-D). It contains the villages of Salisbury, Lakeville, and Lime Rock, 7 churches, public schools, kindergartens, a parochial school, Scoville Memorial Library, Connecticut School for Imbeciles, St. Mary's Convent, Hotchkiss School, a savings society, and a private bank. It is picturesquely located and has 6 large lakes and a variety of mountain scenery. Salisbury contains iron mines (yielding the widely known Salisbury ore), blast furnaces, car-wheel works, and cutlery and cutlery-handle factories. The assessed valuation of the township is about \$1,800,000. Pop. (1880) 3,715; (1890) 3,420; (1895) estimated, 3,500. DONALD T. WARNER.

**Salisbury:** town; capital of Wicomico co., Md.; on the Wicomico river, and the Balt. and E. Shore and the N. Y. Phila. and Norfolk railways; 95 miles S. E. of Annapolis, the State capital, 140 miles S. E. of Baltimore (for location,

discovered. The parotid has one large duct, the duct of Steno; the sub-maxillary, the duct of Wharton; the sublingual—from eight to twenty minute ducts opening independently beneath the tongue—the ducts of Rivinius; and a few uniting to form a single duct, the duct of Bartholine, which joins that of Wharton. These ducts, their branches, and the interior of the glands are lined with epithelial cells. The process of secretion, more or less constant, is most active during the mastication of food; then saliva is abundantly formed and poured into the mouth. The salivary glands are the seat of disease—mumps or parotiditis, a specific inflammation (see MUMPS) of the parotid; inflammation and abscess of the parotid in low fevers; deposits of diphtheritic infiltration in some cases of that disease; not infrequently concretions of chalky matter form in the glands.

Revised by W. PEPPER.

**Salivation** [from Lat. *saliva'tio*, deriv. of *salivare*, *saliva'tus*, to spit, salivate, deriv. of *saliva*]: a specific irritation of the salivary glands, mouth, and throat. Though most frequently due to mercury, it may be caused by other drugs, as iodine, and may occur in certain diseases. In former years mercury, in heroic doses, ranked as a remedy second only to bloodletting. Salivation, though now rare, was then a frequent occurrence—intentionally produced in many cases, in others the accidental result of large doses and individual susceptibility. Children will endure large doses of mercurials without salivation; adults are relatively susceptible. An active state of the skin, kidneys, and bowels, and a healthy state of the mouth, favor immunity from salivation, even when the mercurial taken is considerable; reversely, if opium or any remedy which checks the functional excretions be taken before or at the same time, even small doses of mercury may salivate. Salivation is manifested by a coppery or metallic taste, by soreness of the gums, tenderness of the jaws and teeth when pressed together or closed with force, excessive secretion and flow of saliva, even dribbling from the mouth; swollen, red, ulcerated gums; swollen, coated, salivary tongue, taking the imprint of the teeth; and a foul "mercurial" breath. In grave cases, spongy, bleeding, sloughing gums, loosened teeth, swelling of the face and neck, and even gangrene of the mouth, may result. There is accompanying constitutional depression, fever, pain, and sleeplessness.

Revised by W. PEPPER.

**Sal'lust** (*Gaius Sallustius Crispus*): historian; b. 86 B. C. at Amiternum, in the country of the Sabines, of a wealthy plebeian family; elected *tribunus plebis* in 52; expelled from the senate in 50 by the censors on account of the dissipated and scandalous life he led; reinstated in the senatorial dignity in 49 by being elected *quaestor* by the aid of Caesar, to whose party he belonged, and whom he as *praetor* accompanied to Africa in 46; was appointed proconsul of Numidia, and returned to Rome loaded with riches; formed the magnificent *Horti Sallustiani* on the Quirinalis, and lived in luxurious retirement, devoting himself to the study of history. D. at Rome, 34 B. C. Of his *Historiarum Libri Quinque* only fragments are extant, but his *Bellum Catilinarium* and *Bellum Jugurthinum* have been preserved, and are much appreciated. Editions by Gerlach (8 vols., Basel, 1823-31), Dietsch (2 vols., Leipzig, 1859), Kritz (3 vols., 1828-53); English translations by Sir H. Stuart (1806), by Watson (1852), and by J. R. Mongan (1864). New fragments of the histories were discovered in 1886 by E. Hauler in an Orleans palimpsest; see *Wiener Studien* (viii., p. 315, and ix., p. 25), and the edition of H. Jordan (Berlin, 1887); also *Sallusti historiarum reliquiae*, ed. B. Maurenbrecher (fasc. i., Leipzig, 1891; fasc. ii., 1893).

Revised by M. WARREN.

**Salma'sius**, CLAUDIUS (*Claude de Saumaise*): classical scholar; b. at Semur-en-Auxois, Côte-d'Or, France, Apr. 15, 1588; studied at Paris and Heidelberg; embraced Protestantism; was appointed professor at the University of Leyden in 1631. The ambition of his wife, theological controversies, and above all the scandal caused by his *Defensio regia pro Carolo I.* (1649), which called forth the memorable reply of Milton, induced him to accept a flattering invitation from Queen Christina of Sweden (1650). The climate did not agree with him, and the inhabitants of Leyden urged him to return, because "their university could as little be without him as the universe without the sun." He left Stockholm in 1651, but died Sept. 3, 1653, at Spa. Salmasius is one of the great encyclopaedists of his time, the

high esteem in which he was held being well attested by Balsac's famous saying, "Non homini sed scientiae deest quod nescivit Salmasius"; but, unlike his illustrious contemporaries, Scaliger, Casaubon, and Lipsius, his immense erudition was not kept under control, and in consequence his numerous works present a confused mass of learned detail, accumulated without regard to methodical arrangement and clearness of exposition. As a text critic, Salmasius never occupied any high rank. In 1606 he discovered in Heidelberg the Greek *Anthology* of Kephala, only the so-called *Anthologia Planudea* having been known up to that time. His most famous works are his *Plinianae exercitationes in Solinum* (1629) and a critical edition of the *Scriptores Historiae Augustae* (1620), to which may be added the learned treatises *De lingua hellenistica* (1643), *De usibus*, and *De re militari Romanorum* (1657). See Fr. Crüzer, *Opuscula II.* (pp. 65-75); Saxe, *Onomasticon IV.* (pp. 1888 fl.).

ALFRED GUDEMAN.

**Salmon** [viâ O. Fr. from Lat. *sal'mo*, *salmo'nis*, salmon; cf. *sal'i're*, to leap]: a name given to several species of the genus *Salmo* of the Atlantic, characterized by anadromous habits (that is, by their ascending from the sea into fresh waters to breed), as well as to the species of the genus *Oncorhynchus* of the Pacific. The species belonging to the genus *Salmo* have only about eleven rays to the anal fin,

The Atlantic salmon.

while those of the genus *Oncorhynchus* have fourteen to eighteen. All of these agree essentially in habits. Their natural home is the salt water, for there they obtain their food and rapidly increase in size; toward autumn they ascend rivers, as near as possible to the source, to spawn. During their sojourn in fresh water they almost entirely abstain from food and alter considerably in appearance; this divergence from the normal form is most apparent in the male. The snout becomes attenuated and more or less hooked, and the lower jaw is modified in a similar manner; the body becomes emaciated, and the skin decked with glowing hectic colors. In the salmon of Europe and Eastern America this is temporary, and the males in considerable proportion descend to the sea, revive, and assume their pristine vigor and form. Some of the species of the genus *Oncorhynchus* of the Pacific coast become so abnormally developed that after spawning they die, and their carcasses are left by myriads in the waters they have traversed.

*Salmo salar* is common to the cold waters of Europe and North America. In the U. S. it is nowhere abundant except in some rivers of Maine, although in British America there are a number of streams in which it is found in large numbers. It is generally believed that in former times, and when the country was discovered by Europeans, the species was found farther S., and Hendrik Hudson, in the journal of his ascent of the river which bears his name, records "great stores of salmon in the river." It is tolerably certain, however, that the fish called by him *salmon* was the weakfish (*Cynoscion regalis*), of the family *Scorpaenidae*, having no relation to the *Salmonidae*. The salmon-rivers of Canada are controlled by the Government and let for private use.

The extreme young is banded, and also has red spots. In this state it was long known under the name of *parr*, and supposed to represent a distinct species of the family. Other names are samlet, salmon-fry, and pink. When about a year old, and when the spots have disappeared and it becomes of a bright silvery color before going to the sea, it is called a *smolt*; after its return from the sea into fresh water it is designated as a *grilse*; and finally, on its second return from the sea, it is known as a *salmon*.

*Oncorhynchus quinnat* is the common salmon, king-salmon, or quinnat, of California and farther N.; it is a much deeper fish than the Eastern species, and is, further, at once distinguishable by the greater number of anal rays—fifteen or sixteen generally. This species will live and flourish in much

and military respects. The Emperor Diocletian was born here, and 3 miles to the S. W. he built in 303 A. D. the famous palace, covering 8 acres, to which he retired after his abdication. The city and the palace were destroyed in 641 by the Avars, but on the site of the palace and out of its ruins arose the modern town of Spalato—*Salonæ Palatium*. See SPALATO.

Revised by M. W. HARRINGTON.

**Salonika** [Turk. *Selanik*, anc. *Θεσσαλονίκη*, Thessalonica, whence the modern name]: city; capital of the Ottoman vilayet of Salonica, which nearly corresponds to the ancient Macedonia (see map of Turkey, ref. 4-B). It occupies a most advantageous site on the Aegean, rising amphitheatrically on Mt. Kortiasch from the northeast shore of a fine harbor of the Gulf of Salonica. It was rebuilt on the site of a city named Therma by Cassander, who named it Thessalonica in honor of his wife, the sister of Alexander the Great; after the battle of Pydna (168 B. C.) it became capital of the Roman province of Macedonia; 15,000 citizens were massacred by order of Theodosius (390); it was pillaged by the Saracens (904); taken by the Marquis of Montferrat (1204), who founded the empire of Salonica; and conquered by the Ottomans (1430). The massacre of two foreign consuls by a Mussulman mob on May 6, 1876, contributed to bring on the Russo-Turkish war. As the chief station on the Via Egnatia, which connected the eastern provinces with Rome, it was to St. Paul a center for the dissemination of Christianity, and to it he addressed two epistles. It was called for centuries the Orthodox City, and was largely instrumental in the conversion of the Bulgarians and Slavonians. Along its narrow and crooked streets many architectural monuments are seen. Among them are a hippodrome; a colonnade built by Nero; an arch of triumph with the names of the seven polarchs; an arch of Constantine, erected after his victory over Licinius; many churches, little subsequent to Constantine, exceedingly rich in mosaics, as St. George or the Rotunda (Orta Sultan Osman Djami), St. Demetrius (Kassim Djami), St. Sophia or the cathedral (Aya Sophia); also the mediæval city walls, built on cyclopean foundations. Salonica is the terminus of a trans-European railway, of several highways which traverse the entire vilayet, and, next to Constantinople, is the chief outlet to the commerce of European Turkey. Many European and Ottoman steamship lines touch here regularly. The bazaar is a rambling, antique building, but the scene of great activity. Pop. (1890) 122,000, of whom more than half are Jews, the rest being chiefly Greeks and Ottomans. The inhabitants are industrious and enterprising, and maintain good schools, literary societies and clubs, and a museum. Salonica has manufactories of morocco leather, silk and cotton, and it exports grain, cotton, wool, hemp, skins, opium, wine, and especially tobacco, that called Yenidji being esteemed the finest raised in Turkey.

E. A. GROSVENOR.

**Salop**: See SHROPSHIRE.

**Salpa** [Mod. Lat., from Lat. *salpa* = Gr. *σάλπη*, a kind of stockfish]: a genus of *Tunicata* in which the body is barrel-shaped, with an opening at either end. They are found floating freely in the ocean. In the life-history there is an ALTERNATION OF GENERATIONS (*q. v.*), first noticed by the poet Chamisso. In one generation the individuals are free, and inside of each grows a long coil of embryos. This escapes later, and, remaining entire, forms the chain stage in which the salpæ, placed side by side, form a chain or band, each individual containing an egg which is to grow into one of the single or solitary forms. For structural features, see TUNICATA. See also Brooks, *The Genus Salpa* (Baltimore, 1893).

J. S. KINGSLEY.

**Salsette**: an island of British India (area, 240 sq. miles; pop. about 110,000), connected with the island of Bombay by a causeway and a stone bridge, and famous for the immense rock-cut cave-temples found at Kenery in the center of the island and at several other places. There are many rice-fields and palm-trees. The island was held by the Portuguese from early in the sixteenth century till 1739.

**Salisfy, Oyster-plant, or Vegetable Oyster** [*salisfy* is from Fr. *salisfy* < O. Fr. *aercifi*; cf. Ital. *sassefrica*; *sasso* (< Lat. *saxum*), rock, stone + Lat. *fricare*, rub]: a European plant (*Tragopogon porrifolius*) of the family *Compositæ*. It is cultivated for the roots, which are long, tapering, and have, when properly cooked, a taste somewhat like that of the oyster. The root is highly nutritious. The plant is frequently known as vegetable oyster. The goat's-beard (*T. pratensis*), with yellow flowers, is an introduced weed in eastern parts of the U. S.

Revised by L. H. BAILEY.

**Sal Soda**: See SODA.

**Salt** [O. Eng. *sealt*; O. H. Germ. *salz* (> Mod. Germ. *salz*); Goth. *salt*; cf. O. Bulg. *solt*, O. Ir. *salann*, Lat. *sal*, Gr. *ἅλς*, salt]: chloride of sodium (NaCl). The salt of commerce contains various saline admixtures, due to the peculiarities of the source used for manufacture; their quantity depends also on the method of manufacture. Natural sources of pure salt are unknown; crystals of pure salt may be obtained from a well-developed rock-salt. The presence of common salt in the water of the ocean, of various lakes and springs, as well as its occurrence as an exudation of the soil in several localities of the Orient, is mentioned in the earliest historical records, although under different names.

The idea regarding the chemical constitution of pure salt has changed during the progress of chemistry. The present view was for the first time experimentally demonstrated by Sir Humphry Davy in 1810; he produced pure salt by burning sodium in chlorine gas. Chemically pure salt is usually produced by neutralizing pure sodium carbonate with pure hydrochloric acid, evaporating the solution to dryness, and fusing the residue. Its use is chiefly confined to the chemical laboratory. The salt of commerce is obtained from sea-water, brines, and rock-salt.

**Sea-water**.—The water of the ocean is a weak and, comparatively speaking, impure brine. It contains from 3½ to 4 per cent. of saline matter, of which about three-fourths is chloride of sodium and about one-fourth other salts, viz.: chloride of magnesium and the sulphates of calcium, magnesium, sodium, and potassium. Sea-water varies little in composition and concentration. It represents the main source of supply for the manufacture of salt in France, Portugal, Spain, Italy, the West Indies, and Central and South America, and a small portion of the supply for the U. S.; it is also largely used for the production of salt in Holland, Belgium, and England, being frequently employed for the solution of rock-salt of an inferior color.

**Rock-salt**.—Whenever, during the geological epochs, a larger or smaller body of salt water was cut off from the main ocean, and was subsequently placed under favorable climatic conditions for its evaporation and the subsequent preservation of its saline residue, then a salt-deposit, commonly called rock-salt, was produced. Sometimes several independent deposits occur, one above the other, interstratified with the rocks of the same geological basin. The celebrated salt-deposit of Stassfurt, Germany, is worthy of special notice on account of the large quantities of potassium compounds within its surface layers. The various saline constituents of the ocean are arranged in this deposit in an order which corresponds closely with the degree of their solubility in water. The majority of rock-salt deposits consist only of part of the constituents of the ocean which served for their production. The rock-salt occurs either in densely aggregated masses of cubical crystals, or in compact masses having a conchoidal fracture. It is in some instances colorless and transparent, yet more frequently either red, yellow, or blue, rarely green. Its most common admixtures are either sulphate of calcium and the chlorides of calcium and magnesium, or the sulphates of calcium, magnesium, and sodium, and the chloride of magnesium. Rock-salt deposits consist frequently of alternating layers of salt and gypsum. These various layers are due to successive periods of evaporation. Colorless and dry rock-salt deposits, when easy of access, are directly mined with advantage, and the salt obtained by that process is subsequently brought into a desirable form for domestic use. Colored salt-deposits, or those which suffer from an excess of water, or which contain a large percentage of the above-mentioned foreign saline admixtures or clay, or find those which are located at great depths, are usually dissolved while in the mine, and their solutions treated like brine for the manufacture of salt. Rock-salt deposits have been noticed in every part of the globe. Among those recently discovered in North America are those upon Petite Anse, St. Lawrence Vermilion Bay, Louisiana, at Goderich, Province of Ontario, Canada, in Western New York, and in Michigan.

**Brines**.—Brines are either artificial or natural; that is, they are prepared either by dissolving rock-salt or they are the natural or chance solutions of saline deposits by means of subterranean currents of water. Natural solutions of rock-salt furnish brines at Saltville, W. Va., Goderich, Ont., and in New York and Michigan. The value of a brine for the manufacture of salt does not entirely depend on either the concentration or relative proportion of pure salt and of

ments by leading agricultural chemists. Boussingault proved that those cows which had been fed with an addition of salt to their food did not yield more milk, or contain more fat, or show increase in weight of flesh, yet they looked more healthy and vigorous; in fact, their whole exterior had been highly improved as compared with animals which had been fed with the same food without an addition of salt. Liebig came to the same result; he found in the case of two oxen which were to be stall-fattened, one of which received its food with the addition of a dose of 1 oz. of salt per day, while the other one did not receive any, that the latter soon looked bristly, dull, inactive, and sickly, while the former remained smooth-skinned, lively, and vigorous. The well-recognized superior quality of meat from the cattle and sheep raised upon the marsh-meadows along the seashores of Northern Germany, Holland, Belgium, England, and other countries has been ascribed in a large degree to the fact that their food—the marsh-grasses—is frequently salted by the spray of the oceanic waters.

**Salt a Promoter of Vegetable Growth.**—The use of common salt as a manure for promoting the growth of farm-crops originated at an early date in the history of agriculture. Modern researches do not prove common salt to be valuable as a general fertilizer, but point out its various modes of action, and thereby tend to restrict its use to special kinds of soil and of crop, for it has been noticed that the use of salt frequently exerts not only a decided influence on the chemical composition and physical condition of the soil, but also on the character, i. e. composition, of the plants raised under its influence. All recommendations of careful observers agree in advising the use of but small quantities at a time (from 800 to 400 lb. per acre), applied in a well-diffused form, and only at intervals of years. Numbers of analyses of current farm-crops have shown that a large majority of species of plants growing along the seashores or in the vicinity of saline springs contain much smaller quantities of sodium than potassium compounds. As a natural disintegration of rocks and soil renders, in all probability, sodium as well as potassium compounds accessible as plant-food, there is far less reason, as a general rule, to expect an exhaustion of the soil in sodium compounds as soon as in potassium compounds. These circumstances explain the position which sodium compounds, and chloride of sodium, its most diffused form in lands under cultivation, occupy in a rational system of supplying plant-food to farm-crops. They are considered of secondary importance as plant-food. Nessler has shown that the presence of salt in the soil interferes with a ready combustion of tobacco-leaf, favoring its charring; in the case of the beetroot it has been proved (Grouven) that it increases the percentage of soluble saline compounds in the juice to a considerable degree, and thus reduces their value for the manufacture of sugar. The fact that larger quantities of salt destroy the common flora, and that it merely supports a vegetation of its own, becomes at once manifest to those who glance at the vegetation in the immediate vicinity of salt-springs and marine inlets. Its reputation as a valuable aid in the production of farm-crops rests largely on its action on the physical and chemical condition of the soil. It increases the capacity of the soil to absorb and retain moisture by imparting to it in some degree its own high hygroscopic quality, an influence most desirable in a dry season. An application of from 400 to 500 lb. per acre as a top-dressing on dry grasslands and pasture is frequently followed by good results. It aids in diffusing the existing resources of plant-food (potash and phosphoric acid). Exhausted and worn-out lands derive but little benefit from its periodical use beyond an increased power to retain moisture. Its use is largely confined to the raising of forage-crops.

**Salt for Meat-packing.**—The object of the meat-packer consists not only in securing the preservation of pork and beef for a reasonable time, but also in securing its palatable condition and as far as possible in retaining its natural color. Practice recommends the use of the coarse and hard qualities of salt for meat-packing for the following reasons: They dissolve gradually and contract the meat by degrees to a desirable firmness; they keep the salt pickle within a moderate concentration; they can not enter mechanically into the meat and thus overcharge it, and may therefore be applied in sufficient excess, so as to compensate for the losses of pickle by leakage, etc., without endangering the tenderness and flavor prematurely. Common fine salt answers for a short period of keeping very well, and is consequently used in the packing of meat for immediate con-

sumption. Fifty to fifty-six pounds of coarse salt are usually taken for salting down one barrel of meat; the bottom and the top of the barrel are always carefully covered with a layer of coarse salt. The purer the salt the better the quality of the meat. A salt which contains large quantities of foreign saline admixtures, particularly of chloride of calcium and chloride of magnesium, imparts a pungent and disagreeable taste, and injures also the color of the meat, for these saline compounds have an unpleasant taste, and, being at the same time in a higher degree hygroscopic, they cause a more copious discharge of juice from meat, which renders the latter of a paler color and of a harder texture; the color of packed meat is frequently improved by an addition of niter, which if used on a small scale is harmless. In the U. S. the coarse salt made from brines and from sea-water is used, besides the English coarse and fine salt, the salt from Turk's island, and other localities in the West Indies. Texas meat-packers are trying the superior rock-salt of Petite Anse, La. A good rock-salt is well fitted for the purpose, yet on account of its great hardness it has to be broken up in smaller pieces than common solar salt. For the packing of fish a fine grade of coarse salt is used.

\* Not stated.

**Salt for the Dairy Business.**—The dairy business has attained such commanding proportions that the amount of salt required in its operations amounts to millions of bushels. The peculiar nature of the dairy products of the U. S. calls for the best qualities of salt in the markets. A good dairy salt ought to be of a neutral reaction and of a pure saline taste, free from pungent after-taste; it ought to be of a properly reduced granulated size, dissolving readily in water, free from any offensive odor, without any stain in color, and, what is of not less importance, free from colored specks. The better qualities of the English "common fine salt," "Ashton's brand," etc., were at first used almost exclusively by the dairymen of the U. S., partly because the exporters of provisions in the seaport-towns dealt also largely in foreign salt.

A common fine or boiled salt is in every instance the result of more rapid evaporation, and thus most liable to be affected in its composition by the retention of impure mother-liquors. Washing processes have been devised by which fine salt designed for dairy purposes is freed from its objectionable features. Dairy salt is manufactured in the U. S. from the coarse (or solar) and from common fine salt; made from the former kind, it must be ground finer, for both ought to be in such a state of division as to readily dissolve when worked into the butter or the curd; both kinds ought to be used by weight and not by measure. The English brand is somewhat more bulky than the brands of the U. S., and that portion of the product of the U. S. which has been obtained from boiled salt is lighter than that produced from solar salt; in composition there need be scarcely any difference if made with equal care. The quantity of dairy salt that ought to be used in butter and cheese depends somewhat on the amount of moisture retained in either substance when ready for salting; to have a fully saturated solution of salt left is the real object. The best authorities advise the use of 1 oz. of salt (the best dairy) to 1 lb. of butter, and 1 lb. of it for every 100 lb. of curd.

**Churches, Schools, etc.**—All leading religious denominations are well represented, and many fine church edifices have been erected. The public-school system is equal to any in the U. S.; 15 public-school buildings, aggregating in cost \$750,000, were erected in 1893-94. In 1891 the city contained 8 libraries with 37,000 volumes, and in 1894 there were 4 daily, 2 semi-weekly, 8 weekly, 4 semi-monthly, and 7 monthly periodicals.

**Finances and Banking.**—The receipts of the city government from all sources during 1894 were \$1,937,661; expenditures, \$1,019,170, including the unusual ones of \$238,672 for gravity sewer, and \$156,258 final payment on city and county building. The city tax-rate is 6½ mills; the assessed valuation in 1894 was \$35,000,000. The city has gas and electric light works, and owns a water system valued at \$2,000,000. The bonded municipal debt in 1894 was \$2,400,000. In 1895 there were 4 national banks with combined capital of \$1,500,000, 3 State banks with capital of \$1,200,000, 5 private banks, 2 incorporated banks, and a savings-bank with capital of \$100,000.

**Business Interests.**—Manufacturing is extensively carried on. The city is headquarters for mining men, and is the mining center of Utah and adjoining States. It is the dépot for agricultural products, and the distributing-point for a large agricultural area under a perfect system of irrigation. The census returns of 1890 showed 149 manufacturing establishments (representing 45 industries) with a combined capital of \$2,658,676, employing 1,997 persons, paying \$1,276,219 for wages and \$1,665,877 for materials, and turning out products valued at \$3,864,402.

**History.**—The city was founded by BRIGHAM YOUNG (q. v.) July 24, 1847. Until 1870 the population was almost entirely Mormon, but the development of mining and other industries induced a large immigration. The beauty of the city and its environment, the presence of hot springs and the Great Salt Lake, and the rare climatic and scenic advantages, make Salt Lake City an attractive place for tourists. Pop. (1880) 20,768; (1890) 44,843; (1895) estimated, 65,000.

EDWARD F. COLBORN.

**Salto:** a town of Uruguay; on the river Uruguay, at the head of navigation for large vessels; opposite Concordia in the Argentine Republic (see map of South America, ref. 7-E). It is connected by railway with Montevideo and the Brazilian frontier; is the shipping-port for the trade of the upper Uruguay, including the western part of Rio Grande do Sul; and is the center of a rich grazing district. Pop. about 12,000. It is the capital of the department of Salto, which has an area of 4,940 sq. miles and a population of 32,000, almost entirely employed in the grazing industry.

H. H. S.

**Salton Lake:** a temporary lake, caused by an overflow of the Colorado river into a depressed area in the Colorado Desert. The bed of the lake is N. and a little W. from the head of the Gulf of California, and W. of the Colorado river in California, and probably was once occupied by the Gulf waters. The lake was formed in the early summer of 1891, when the river was unusually high, and remained fairly constant several months, when it began to shrink slowly. The spot has large deposits of salt, which changed the fresh waters of the river into salt water in the lake. See COLORADO DESERT.

M. W. H.

**Saltonstall, GURDON:** Governor of Connecticut; great-grandson of Sir Richard Saltonstall; b. at Haverhill, Mass., Mar. 27, 1666; graduated at Harvard 1684; ordained minister of New London, Conn., Nov. 25, 1691; was distinguished as an orator, and took so active a part in politics that he was made Governor of Connecticut 1707, and held that post until his death Sept. 20, 1724. He bequeathed £1,000 to Harvard College to educate students for the ministry.—His son, GURDON, b. at New London, Conn., Dec. 22, 1708, graduated at Yale College 1725; became brigadier-general of Connecticut forces 1776; was cashiered for misconduct in the Penobscot expedition 1779; died at Norwich, Sept. 19, 1785.—DUDLEY, nephew of Gen. Saltonstall, b. at New London, Sept. 8, 1738, became a commodore in the Continental navy, and died in the West Indies in 1796.

Revised by G. P. FISHER.

**Saltonstall, Sir RICHARD:** colonist; b. at Halifax, England, in 1586; nephew of Sir Richard, who became lord mayor of London 1597; emigrated to Massachusetts as assistant governor to Winthrop 1630; was associated with Phillips in the foundation of Watertown 1630, but went back to England the following year, and never returned to

Massachusetts. In 1651 he wrote a letter to the Massachusetts ministers Cotton and Wilson remonstrating against the persecution of the Quakers. D. in England about 1658. Through his sons, who settled in Massachusetts, he was ancestor of the Saltonstalls of New England.—RICHARD, b. at Woodsome, Yorkshire, England, in 1610, was matriculated at Emmanuel College, Cambridge, 1627; was an early settler of Ipswich, Mass.; was assistant governor 1637; befriended the regicides Goffe and Whalley, and protested against the introduction of Negro slavery into the colony. He returned to England in 1670. D. at Hulme, Apr. 29, 1694.

**Saltonstall, RICHARD:** jurist; b. at Haverhill, Mass., June 14, 1703; graduated at Harvard 1722; was a representative from Haverhill as early as 1728; was frequently a member of the general court and of the executive council; was a scientific and practical farmer, and also learned in the law; was chairman of the commission for settling the boundary-line between Massachusetts and New Hampshire 1737, and was judge of the superior court nearly twenty years (1736-55). D. Oct. 20, 1756.

**Saltpeter, or Nitre** [*saltpeter* is (by analogy of *salt*) from Fr. *salpêtre*, from Lat. *salpe'tra*, liter., rock-salt; *sal*, salt + *pe'tra*, gen. of *pe'tra*, rock, stone]: a compound in chemistry called potassium nitrate (KNO<sub>3</sub>), that has long been known and occurs widely distributed in nature, though in relatively small quantities. When refuse animal matter undergoes decomposition in the soil under proper conditions, the nitrogen contained in it passes into the form of a nitrate, and as potassium is generally present, the particular nitrate formed is saltpeter. The change is brought about by the action of certain microbes which exist in the soil, and are especially abundant and efficient in warm countries. It is in such warm countries that saltpeter earths are found. In Bengal the saltpeter earth of the villages is collected by a special caste, the Sorawallahs, into loosely aggregated heaps. From these the salt is obtained by scraping off the uppermost layers, which show a white efflorescence. The process of nitrification is carried on artificially on a large scale in the so-called "saltpeter plantations." In these, refuse animal matter, more especially manure, is mixed with earthy material, wood-ashes, etc., and piled up. These piles are moistened with the liquid products from stables. After the action has continued for two or three years the outer crust is taken off and extracted with water. The solution thus obtained contains, besides potassium nitrate, calcium and magnesium nitrates. It is treated with a water-extract of wood-ashes or with potassium carbonate, by which the calcium and magnesium are precipitated as carbonates. Much of the saltpeter in the market is made from sodium nitrate by treating it with potassium chloride, advantage being taken of the fact that sodium chloride is less soluble in water than potassium nitrate. Saltpeter crystallizes in long rhombic prisms of a salty taste. When dissolved in water it causes a lowering of temperature. It is used in the manufacture of fireworks. Its chief use, however, is in the manufacture of gunpowder. IRA REMSEN.

**Saltpeter, Chili:** a salt known in chemistry as sodium nitrate (NaNO<sub>3</sub>). It is also called cubic nitre, because it crystallizes in rhombohedrons resembling a cube. It occurs abundantly in Northern Chili, especially in Tarapaca, and to some extent in Southern Peru. The natural salt contains, besides the nitrate, sodium chloride, sulphate, and iodide. Sodium nitrate is very similar to potassium nitrate, but it can not be used in place of the more expensive potassium salt in the manufacture of gunpowder, because it becomes moist in the air, and does not decompose as quickly as potassium nitrate. It is used extensively in the manufacture of nitric acid and of potassium nitrate; it is also the most important source of iodine. In commerce the salt is known simply as nitrate. It is largely exported from Chili to Europe for use as manure. In 1892 the value of the exports was 31,785,000 pesos. For this purpose the native salt is rendered marketable by a process of solution and crystallizing. In its action it is comparable with calcium or potassium nitrates. IRA REMSEN.

**Salt Range, or Kalabagh Mountains:** a mountain group of the Punjab, India; extends westerly from the west bank of the Jhllam to the Suleiman Mountains, with a break in its continuity where it yields a passage to the Indus. It is only 2,500 feet high, but its bold peaks and steep, wild precipices, consisting of granite, gypsum, and layers of almost perfectly pure rock-salt (which has been mined from

of higher rank or authority by raising or touching the hat, dropping the point of the sword, presenting arms, firing cannon or small-arms, manning yards, dipping the colors, etc. In the personal salute with cannon the number of guns fired depends upon the rank of the person saluted. In the U. S. the President receives 21 guns, the Vice-President 19, the members of the cabinet, the chief justice, the Speaker of the House of Representatives and Governors within their own State or Territory, 17 guns. The general receives 17 guns, lieutenant-general or major-general commanding 15, major-general 13, and brigadier-general 11 guns. Besides these personal salutes there are the national salute of 21 guns, the salute to the Union of one gun for each State, and the old Federal salute of 13 guns. These are fired in honor of certain days and occasions.

In the personal salutes is seen the survival of the custom of the saluter placing himself unarmed in the power of the saluted. The touching or removal of the cap, dropping the point of the sword, presenting arms, firing cannon and small-arms, manning yards, etc., symbolize the removal of the helmet, giving up the weapon, unloading the firearms, exposing the crews, abandoning the guns, etc.

JAMES MERCUR.

**Saluzzo**, sāl-loot'sō: town; in the province of Cuneo, Italy; 42 miles by rail S. by W. of Turin (see map of Italy, ref. 8-B). The cathedral, semi-Gothic and of the fifteenth century, the Church of St. Martin and St. Bernard, of St. Domenico, etc., all contain objects of interest. In one of the public squares there is a fine monument erected to Silvio Pellico, who was born here. The ancient castle of the Marquises of Saluzzo is used as a prison. Saluzzo manufactures silk, leather, and hats. Pop. 9,716.

Revised by M. W. HARRINGTON.

**Salvador**, Span. pron. sāl-vā-dor' (often, but incorrectly, called *San Salvador*, from its capital): a republic of Central America; bounded N. W. by Guatemala, N. and N. E. by Honduras, and S. by the Pacific, the Gulf of Fonseca separating it from Nicaragua on the E. Area, 7,255 sq. miles; pop. (1891) estimated, 777,895; it is thus the smallest but the most thickly settled republic in America. The main Cordillera of Central America runs along the northern frontier. Parallel to this, and about 30 miles farther S., another mountain chain, attaining nearly 8,000 feet, crosses from E. to W., and is continued into Nicaragua; this chain is entirely of volcanic origin, and contains nearly thirty active or quiescent craters. The space between the two mountain ranges is an irregular basin or plateau, 2,000 feet in average elevation, and varied by low mountains; this is the finest and most thickly settled part of Salvador. S. of the volcanic range a strip of low land, partly alluvial, fringes the Pacific. The coast is about 200 miles long, partly rocky, but not high. The only very good harbor is formed by the Gulf of Fonseca; the commercial ports are La Unión on the gulf, La Libertad, and Acajutla. The principal river is the Lempa, which drains the plateau and is partly navigable; there are several beautiful lakes, including Cuija, on the Guatemala frontier, and Ilopango. Volcanic and seismic disturbances are very frequent; in the central range eruptions from one or more peaks are almost constantly going on. Slight earthquakes are so common as to be hardly noticed, and severe ones occur at intervals; San Salvador has been ruined no less than eight times. The climate is hot and often unhealthful on the coast, warm on the plateau, temperate in regions above 3,000 feet, where most of the towns are located. Rains are less abundant than in other parts of Central America, though the climate is by no means dry. The rainiest months are from May to October, and in July and August there are frequent torrential showers and thunder-storms. Considerable tracts of forest remain, and are rich in cabinet woods, balsam, etc. The land, especially that formed by disintegrated volcanic tufa, is very fertile, and most of the inhabitants are engaged in agriculture. The most important crops are coffee, indigo, tobacco, sugar, and, for home consumption, maize, beans, and rice. Large herds of cattle are pastured in some districts. Gold and silver are mined on a small scale. About 5 per cent. of the population are classed as whites, 55 per cent. as Indians, and the remainder as mixed races, with a few Negroes; some of the Indians retain their own language and customs, but all are submissive and, nominally, Roman Catholics. As elsewhere in Central America, the educated and intelligent class is small, but controls all the wealth and power. The government is a centralized re-

public; the president is elected for four years, and congress consists of a single house elected for one year. The fourteen departments are essentially governed from the capital. The state religion is the Roman Catholic; other creeds are tolerated, but are almost unknown. There are about 900 public and private schools, with 85,000 pupils; the state maintains a university with faculties of sciences, arts, law, medicine, etc. The only railway runs inland from Acajutla (53 miles in 1893), but others are planned; the common roads are nearly all bad. There is a fairly good telegraph system, and cable communication with the U. S. The principal exports, in the order of their importance, are coffee (about half of the total), indigo, sugar, and silver; the average annual value of the exports in 1894 was about 6,000,000 pesos. The value of the recorded imports is little over half as much, but the figures are probably defective. Nearly one-third of the entire trade is with the U. S.—principally California—and the proportion is increasing. The monetary standard is the silver peso or dollar, equal to 96½ cents of U. S. silver in intrinsic value. Few national coins are in circulation; those of Europe, the U. S., Mexico, Peru, etc., are freely used. The metric system of weights and measures is legalized, but the old Spanish ones are still in general use. The external debt, payable in gold, was in 1893, about \$1,500,000, and the interest is promptly met; the internal debt, partly funded, is about 7,500,000 pesos. Salvador or Cuscutlan was conquered by Jorge de Alvarado in 1528, and during the colonial period it was a province of Guatemala. From 1823 to 1839 it was a state of the Central American Confederation. The numerous revolutions and wars with other Central American republics have generally been caused by attempts to bring about a union of the republics, or struggles in favor of autonomy. See Guzman, *Topografía física de la República del Salvador*; Squier, *The States of Central America* (1858); Reyes, *Vida de Morazan* (1888); Bancroft, *History of the Pacific States: Central America* (1882-87).

HERBERT H. SMITH.

**Salvage** [from O. Fr. *salvage*, liter., a saving, deriv. of *salver* > Fr. *sauver* < Lat. *salvare*, save, deriv. of *salvus*, safe]: the compensation due for the relief of a vessel, or of property or persons therein, from an impending peril of the sea, by the voluntary exertions of those who are under no legal obligation to render assistance, resulting in the ultimate safety of the object of such relief.

It is not necessary that the peril be immediate. It is enough that it is probable, as where the motive power of a steamer ceases, or a sailing vessel is dismasted. Fire, endangering a vessel afloat, is a marine peril. Recapture from pirates or the public enemy is relief from a sea peril, and, if lawful, will be rewarded with salvage. Recapture by a ship of a neutral power is unlawful.

The crew or passengers of the relieved vessel are not entitled to salvage, as a rule, because in case of a common danger it is the duty of every one on board the ship to give every assistance he can, by the use of all ordinary means, in working and pumping the ship, to avert the danger. Yet, if one of the passengers or crew renders services outside and beyond his legal duty he may recover salvage. (*The Commarra*, 108 U. S. 352.) Members of a fire department, who act in the performance of a legal duty in saving a vessel, are not entitled to salvage.

The services must be successful to some extent, for if the property is not saved, or in case of capture is not retaken, no salvage is earned. More than one set of salvors, however, may contribute to the result; and all who materially contribute to the saving of the property are entitled to share in the reward, in proportion to the nature, duration, risk, and efficiency of the service rendered.

The amount of salvage to be awarded is largely a matter of fact and discretion in each case; and an appellate court rarely varies the amount given upon the trial. In determining salvage compensation, admiralty judges consider: (1) the labor expended by the salvors; (2) the promptitude, skill, and energy which they display; (3) the value of the property employed by the salvors, its risk, and their personal risk in rendering the service; (4) the value of the property saved and its risk. Salvage is not to be confused with Prize (*q. v.*). The latter is more like a gift of fortune, conferred without regard to the loss of the owner, who is a public enemy, while the former is a reward for saving the property of the unfortunate, and should not exceed what is necessary to insure the most prompt, energetic, and daring effort of those who are able to furnish relief.

command of the Canada forces. Of the daughters, the eldest, Catherine, has since 1881 been in charge of the French work, with the title of *La Maréchale*, and two, Emma and Lucy, have India especially in charge—the latter living with and as the native poor. Other notable names identified with the army's progress are those of Commissioners Booth-Clibborn, Booth-Tucker, Railton, Hanna Ouchterlony, Howard Carleton, Cadman, Coombes, and Ridsdell.

The auxiliary league is composed of persons who, not necessarily indorsing every method used by the army, yet sympathize in its desire to reclaim the fallen and to save the lost, and who are precluded from taking any other part in it by pressure of other duties or ill health. Many persons of influence and position in this way assist in removing prejudice and encouraging the work.

In Oct., 1890, Gen. Booth published *In Darkest England, and the Way Out*, a book in which he dealt with and solved the problem of destitution and crime from the standpoint of the Salvation Army, through which alone it would be practicable to carry out such a scheme as he proposed. Five million dollars would be required, by the general's estimate, to put the whole in working order, but half a million would be sufficient to start it. On Jan. 30 following Gen. Booth publicly signed a deed of trust for the half million dollars, and two parts of the plan—the City Colony and the Farm Colony—are in successful working order and self-supporting, and negotiations are well under way (1894) for the third—the Over-the-sea Colony. Should the plan be fully carried out, the general declares that in England in twenty years no man or woman willing to work would be unemployed. Perhaps in no country has the Salvation Army made more rapid strides, or taken deeper hold, than in the U. S. On Mar. 10, 1880, Commissioner George Scott Railton, in company with seven illiterate yet earnest young women, landed at Castle Garden, New York. After a time the work was very prosperous, but unfortunately, owing to the unfaithfulness of one in its command, a secession took place in Oct., 1884, which resulted in the loss of the official organ, property, and many officers. Commissioner Frank Smith followed in office and was in command some three years, during which a hard struggle was experienced. Commander and Mrs. Ballington Booth took command of the work in the U. S. in Apr., 1887, and since 1890, in particular, the progress of the movement has been rapid. In Nov., 1892, the army was established in 553 cities and towns, having 656 corps and outposts, and during that month the 1,500th officer was commissioned. Five-eighths of the officers are by birth or naturalization citizens of the U. S. In Jan., 1895, there were 2,002 officers. The official organ is the *War Cry*, and there are also a Swedish and a German *War Cry* and a monthly magazine known as *The Conqueror*. It was reported that 14,000,000 persons had attended the army's services during the year 1891 throughout the U. S.

BALLINGTON BOOTH. MAUD BALLINGTON BOOTH.

**Salvator Rosa**: an anglicized form of the name. See ROSA, SALVATORE.

**Salvianus**: presbyter of Marseilles; an important Christian writer of the fifth century; b. probably at or near Treves; author of several works, of which the following are extant: 1. *Ad Ecclesiam*, in four books, a tractate against avarice, published under the pseudonym of *Timotheus*; 2. *De Gubernatione Dei*, composed between 439 and 451, in eight books, in defense of God's constant providence; 3. Nine letters. Salvianus's Latin is excellent for the period, and bears evidence of a study of Lactantius, but he is diffuse and very rhetorical. Of the vices of his time he gives a most vivid picture. Best editions by C. Halm (Berlin, 1877) and F. Pauly (Vienna, 1883). M. WARREN.

**Salvini**, sal-vee-née, TOMMASO: tragedian; b. in Milan, Italy, Jan. 1, 1830. His father abandoned the profession of literature for the stage. His mother was also an actress. Young Salvini showed a rare talent for acting, and he was placed under the tuition of Gustave Modena, and about 1847 joined the Ristori troupe, and achieved success. In 1849 Salvini took an active part in the war of Italian independence, and became the friend of Mazzini, Garibaldi, and Saffi, with whom he was taken prisoner at Genoa. Retiring to Florence he devoted a year to professional study, preparing among others the rôles of Othello, Saul, Hamlet, and Orosmanes. His theatrical tours in Italy, Spain, and Portugal were a series of ovations. In 1872 Salvini visited South America, where he was received with equal enthusiasm, and in 1873-74 he made a tour in the U. S., giving 128 perform-

ances, as well as twenty-eight in Havana, Cuba. In 1881-82 he again visited the U. S., and made a third tour in 1885-86, since which he has retired from the stage, and lives in Florence. Salvini also acted in Great Britain, Germany, Austria, and Hungary, producing everywhere a profound impression. B. B. VALLENTINE.

**Salzburg**: capital of the duchy of Salzburg, Austria; 195 miles by rail W. by S. of Vienna (see map of Austria-Hungary, ref. 5-D). It is picturesquely situated at the foot of the Noric Alps, on both sides of the Salza, which here rushes forth from a narrow defile and winds through the city toward the Inn. The city is old, with crooked and narrow streets, but it contains many fine monuments and edifices built of white marble. It is surrounded with walls, pierced by twenty gates, of which the most remarkable is the Sigismund Thor, 425 feet long, hewn through the Mönchsberg. It has a fine cathedral (1614-34), a Benedictine monastery with a library of 65,000 volumes and 900 MSS., a botanical garden, a college, a theological seminary, a medical school, a museum of antiquities, and a public library with 82,000 volumes and 1,400 MSS. After 798 Salzburg was the seat of archbishops who became noted for their ecclesiastical severity. In 1498 the Jews were expelled, and in 1732 30,000 Protestants were compelled to leave their homes. Salzburg has manufactures of paper-hangings, musical instruments, lead-pencils, mirrors, and type, several oil-mills and factories for spinning and weaving cotton, and carries on an active trade with Vienna and Bavaria. Pop. (1891) 27,644.

**Salzkammergut**: district of the Austrian province of Upper Austria, between Salzburg and Styria; remarkable for the beauty of its scenery and for its salt-works. It comprises an area of 255 sq. miles, with 19,000 inhabitants. On account of the alpine character of the district, agriculture is almost impracticable; the inhabitants are mostly engaged in cattle-rearing and dairy-farming, and in the manufacture of salt from the salt-springs. The most striking feature of the scenery is the lakes, inclosed by forest-clad mountains. The highest peak, Hoher Priel, reaches an elevation of 7,361 feet. The most celebrated of the lakes is Traun, formed by the river Traun. The richest salt-works are those of Ischl and Hallstadt. Revised by M. W. HARRINGTON.

**Samana' Bay**: a deep indentation in the eastern end of the island of Santo Domingo (Dominican Republic), West Indies. It is 37 miles long and 12 wide, with two entrances, which could be easily defended by forts; it forms a very large and fine harbor, perfectly safe except in the rare event of a cyclone from the E. The principal ports are Sabana la Mar on the south side and Santa Bárbara de Samaná on the north. Although it lies near the route from New York to the Isthmus of Panama, the U. S. Congress refused to ratify a treaty for its purchase in 1870.

HERBERT H. SMITH.

**Samar**: one of the Visaya group, Philippine islands, East Indies; area, 5,167 sq. miles; pop. (1887) 185,386 inhabitants, most of whom are mestizoes. The mountains of this island are higher and wilder than those of the other islands. The capital is Catbalonga, on the west coast. The principal articles in which trade is carried on are wax, cabinet woods, palm oil and mat-work. Revised by M. W. HARRINGTON.

**Samara**, sâ-mâ-râ: government of European Russia; bounded E. by the Kirghiz steppes and W. by the Volga. Area, 58,321 sq. miles. It is very fertile and well adapted to agriculture, but thinly peopled. Pop. (1890) 2,665,300.

**Samara**: capital of the government of Samara, European Russia; on the Volga (see map of Russia, ref. 7-H). It has an extensive trade in grain, fish, caviare, tallow, and hides. Pop. (1891) 99,856.

**Samarang**: town of Java, East Indies; the capital of the Dutch residency of Samarang; on the northern coast of the island, at the mouth of the river Samarang (see map of East Indies, ref. 8-D). It is tolerably well built, and has an important trade, though its climate is unhealthy and its harbor shallow, and in the wet season even unsafe. Sugar, rice, and pepper are extensively cultivated in its vicinity, and it is the entrepôt for the products of the central part of the island. Pop. 71,440, of whom 3,600 are Europeans.

**Samaria** [from Lat. *Samaria*=Gr. *Σαμάρια*, from Heb. *Shômron*]: an ancient city of Central Palestine, 6 miles N. W. of Shechem, and about half-way between the Mediterranean and the Jordan. It was founded 923 B. C. by Omri, the sixth of the nineteen kings of the northern kingdom of Israel, who

and י.—The letters are twenty-two in number, their order being the same as in Hebrew, but their *form* is like the ancient Hebrew and Phœnician, and not like the square character adopted by the Jews subsequent to the Exile. In pronunciation they are the same as Hebrew, except the gutturals, which are all quiescent and interchange readily with one another, being exceedingly weak. The vocabulary is essentially the same as the Hebrew and Chaldee, although many words have been introduced from Arabic, Latin, and Greek. See Uhlemann, *Inst. ling. Samarit.* (Leipzig, 1837); Nicholls, *Grammar of the Samaritan Lang.* (London, 1858); Petermann, *Brevis Ling. Samarit. Gr.* (Berlin, 1873).

The Samaritan literature is limited in extent. (1) The Samaritan Targum is ascribed by tradition to Nathanael the high priest, who died 20 b. c. There is no reason to doubt that it was composed about the same time as the Targum of Onkelos, with which it has many points of agreement, although certainly an entirely independent version. The translation is exceedingly literal and close, even where the sense was not clear to the translator. (Cf. Winer, *De Versionis Pent. Samaritanæ indole* (Leipzig, 1817); Petermann, *Pent. Samarit.*, fasc. i. Genesis (Berlin, 1872); Brüll, *Samarit. Targum zum Pent.* (Frankfort, 1875), in Hebrew square characters. Cf. also *Fragments of a Samaritan Targum*, with an introduction by Nutt (London, 1874), and *Krit. Studien über manuscr. Frag. des Sam. Targ.* von Brüll (Frankfort, 1875).) This Targum is also printed in the great Paris and Walton Polyglots. The Samaritans had also a Greek version, mentioned by some of the Fathers as τὸ *Σαμαριτικόν*, which has been lost; also an Arabic version, which they still possess. (2) *Chronicles*.—First in importance is the Samaritan Chronicle, or book of Joshua, composed probably in the thirteenth century, taking some of its material from the Hebrew book of Joshua, but adding thereto much of a legendary character, showing that the Jews were from the time of Eli apostates and their oppressors, continuing the narrative until about 850 A. D., where it concludes abruptly. It was published by Juynboll (Leyden, 1848), with Latin translation and commentary. There is also the chronicle *El Tholodoth* (The Generations), professedly by Eleazar ben Amram (1142 A. D.), and then continued by many others until 1859, giving the calculation of sacred times, the age of patriarchs, list of high priests until the present. It was published by Neubauer in *Journal asiatique* (1869). Then comes the chronicle of Abulfath, in the middle of the fourteenth century, a digest of the two previous works, with fresh legendary material, published by Vilmar (Gotha, 1865). Other minor works, corresponding with the Jewish Hagada literature, are found. (3) *Liturgies and Hymns*.—Nutt (p. 143) says that there are nineteen volumes of these in the British Museum, besides those known in the *Carmina Samarit.* of Gesenius (Halle, 1824) and *Karne Shomeron* of Kirchheim (Frankfort, 1851). Petermann publishes specimens in his *Gram. and Chrest.* The present Samaritans have two collections, called *Durrân* (String of Pearls) and *Defter* (Book). These hymns and prayers belong to widely different periods. The earliest are ascribed to the angels. Heidenheim has published many of them in his *Vierteljahrsschrift*. (4) There are also commentaries, theological tracts, and a few recent grammatical works, written in Arabic. See the article *Samaria* in Herzog's *Realencyk.*, by Petermann; Smith's *Dict.*, by Deutsch; Kitto, *Cyclop.* (3d ed.), by Davidson; and Nutt, *Samaritan Hist., Dogma, and Literature* (London, 1874). C. A. Briggs.

**Samarkand'**, or **Samarcand** (probably the ancient *Mara-canda*): capital of the province of Serafshan; comprising the southern part of Russian Turkestan; situated at an elevation of 2,154 feet above the level of the sea, 8 miles S. of the river Serafshan (see map of Asia, ref. 4-D). By the Arabian poets of the Middle Ages it is described as a paradise on account of its beautiful surroundings, and under the dynasty of the Sassanides (833-1000 A. D.) it flourished as a home for learning and all the arts of peace. It lost much by the occupation of Genghis Khan in 1219, but it rose again toward the close of the fourteenth century, when Timur made it the capital of his immense empire, and adorned it with architectural monuments of all kinds—the tomb of Kasim-bin-Abbas, the mosque of Timur, the citadel, Timur's tomb, the Medresse, etc. By the Mohammedans of Central Asia the city is still considered the principal seat of Mohammedan learning, and its eighty-six mosques and twenty-three colleges attract numerous pilgrims and students. In 1868 it was seized by Russia, with the whole dis-

trict of the Serafshan. The Transcaspian Railway has been completed to Samarkand. Pop. in 1889, according to Curzon, 40,000, of whom 6,000 are in the European quarter.

Revised by M. W. HARRINGTON.

**Samar'rah**: town; in the vilayet of Mesopotamia; on the left bank of the Tigris; 62 miles N. W. from Bagdad (see map of Turkey, ref. 7-J). It was founded by the Caliph Motassem (836) with frightful extravagance. The stable of the caliph could contain 100,000 horses. The city is revered by the Shi'ite Mussulmans, and annually attracts great numbers of pilgrims. Pop. 8,000. The ruins of ancient Opis and of the Median wall, which extends for several miles along the river, are close by. E. A. G.

**Sambation** [through Heb. from Gr. *σαββατικὸν νόμον*]: a river said by Oriental folk-lore to flow during the week, but to rest on the Sabbath. It is first mentioned by Pliny (*Hist. Nat.*, xxxi., 2). Josephus (*Bell. Jud.*, vii., 5, 1) reverses the order, and says it flows only on the Sabbath. In the Midrash and later Jewish saga it is connected with the reported dwellings of the ten lost tribes (*Jew. Quart. Rev.*, i., p. 20, seq.). It is useless to attempt to identify the river, but the belief had its origin in the many intermittent springs in Palestine, and in the wish to make nature witness to the holiness of the Sabbath. There existed another saga on a river which flowed sand and stones (Bar Hebraeus, in *Mittheil. d. Acad.-Orient. Ver. zu Berlin*, iii., 38), which, because of its name (*Nahar hól*, Sand or Week river), was confounded with the Sambation (*All. Zeit. d. Judenth.*, May 20, 1892, p. 247; *Zeit. f. Assyriol.*, viii., p. 273). Similar traditions exist in the East. See also Neubauer, *Geogr. du Talmud* (1868, p. 33); Brüll, *Jahrbücher f. Jüd. Gesch.* (i., p. 64; *Zeit. f. Volkskunde* (ii., p. 297). RICHARD GOTTHEIL.

**Sambre**, *sañbr*: a small river of Europe which rises in the department of Aisne, France, flows in a N. E. direction, and joins the Meuse at Namur in Belgium after a course of about 100 miles. It is navigable for a great part of its course, and forms an important part of the system of canals in Northern France and Belgium.

**Sam'sen** [Jap., liter., the three pleasing threads]: the most popular of Japanese musical instruments. It consists of a neck or finger-board 2½ feet long, and a square drum (7½ by 7 inches), rounded off at the corners and covered with parchment. There are three strings of silk, which the player strikes with a broad pecten, 8½ inches long, of wood, ivory, or tortoise-shell. The parchment covering the drum is of cat-skin, and is double at the point where the player strikes. The instrument is held by the left hand, close to the left shoulder, transversely, so that the drum comes under the right arm. The drum receives the first blow from the pecten or *bachi*, and thus two vibrations are set up. In the fingering the nails are made to press the strings. The instrument is said to have been introduced from Loos about 1560. J. M. DIXON.

**Sammon'icus**, **QUINTUS SERENUS**: a Roman poet of the third century A. D., whose didactic poem, *De Medicina*, in 1,115 hexameters, is a collection of medical receipts drawn largely from the elder Pliny; correct in versification, but dull and prosaic. Edited by Ackermann (Leipzig, 1786), and in Bachrens's *Poet. Lat. Minores*, vol. iii., pp. 102-158. M. W.

**Sam'nites** [from Lat. *Sam'nis*, plur. *Samnites*, a Samnite, deriv. of *Sam'nium*, for older *Sabinium*, name of their country, deriv. of *Sabi'nus*, Sabine]: a people of Sabine origin occupying Samnium, the territory of Central Italy S. of the *SABINES* (q. v.). Like the latter, they were a confederation of tribes, but their organization seems to have been more perfect than that of the parent race. They gradually moved beyond the natural boundaries of their territory, and occupied points on the Adriatic, and in the territory of Campania and Lucania, coalescing with the Oscan peoples who inhabited this region. In the northern part of Campania they came in contact with the Romans, and thus was inaugurated the long series of wars which resulted in Rome's conquest of the whole of Southern Italy (272 B. C.). The Samnites probably found the Oscan language in the original territory which they occupied, as well as in Campania, but as their own (the Umbro-Sabellian dialect) was so closely related to it, the mingled product does not seem to have differed much from the original Oscan. G. L. HENDRICKSON.

**Samnium**: See **SAMNITES**.

**Samo'a**: group of fourteen volcanic islands of Polynesia, N. E. of the Fiji islands; lying nearly E. and W. between

Jud. xvii.-xviii. and xix.-xxi. The author took pains to divide the story into two parts. The first part (xiii. 2-xv. 20) gives an account of the birth and the wild youth of Samson, up to the time when, after the battle of Lehi, "he became judge of Israel, in the days of the Philistines, twenty years." The second part (xvi.) gives an account of the last few weeks or months of his life, when he relapsed into folly, and perished thereby, "he having been judge of Israel twenty years." Samson is the son of the Danite Manoah of Zorah (xiii. 2), living in Mahaneh-Dan (xiii. 25, xvi. 31; comp. xviii. 11-12). To his mother, long barren, the birth of a son was announced by an angel (comp. Luke i. 7, 13). He is a Nazirite by birth (xiii. 5, 7, xvi. 17; comp. 1 Sam. i. 11), a different thing from being a Nazirite temporarily by vow (Num. vi. 2-21). Through his passion for a Philistine woman, he providentially becomes involved in a series of personal quarrels with the Philistines. In these, though he is not blameless, he has the sympathy of the reader. One exploit leads to another, until he becomes judge. No details of his career as judge are given. In his youth, however, the Philistines ruled Israel (xiv. 4), and Israel, judging by the conduct of the men of Judah (xv. 10-13), was in an abject condition; while in his later years the Philistines kept their own side of the border (xvi.). The inference is inevitable that the twenty years of his administration were a success, and fulfill the promise made before his birth (xiii. 5). Many imagine that he was merely a local judge, but, if language means anything, the statement that he "judged Israel" indicates that he was chief magistrate of the nation. Ussher assumes that the twenty years of Samson followed the forty years of Eli, and dates them B. C. 1140-1120. It is more probable that Samson belongs to the time of Philistine oppression, some decades earlier (Jud. x. 7). Revised by W. J. BEECHER.

**Samson.** GEORGE WHITEFIELD, D. D.: theologian and critic; b. at Harvard, Mass., Sept. 29, 1819; graduated at Brown University 1839, at Newton Theological Institute 1843; was for many years pastor of a Baptist church at Washington, D. C., and president of Columbian College, D. C., 1859-71, when he became president of Rutgers Female College, New York. He traveled in Europe and the East 1848, publishing a series of letters and essays on Italy, Egypt, Palestine, and Sinai; has written several theological pamphlets and critical essays on art, and is author of *To Dæmonion, or the Spiritual Medium* (1852), reissued in an enlarged form under the title *Spiritualism Tested* (1860); *Outlines of the History of Ethics* (1860); *Elements of Art Criticism* (1866); *Physical Media in Spiritual Manifestations* (1869); *The Atonement as assumed Divine Responsibility* (1878); *Bible Revisers' Greek Text* (1880); *Bible Wines* (1883); *Idols of Fashion and Culture* (1887); *Tested Truths as to Relations of Capital and Labor* (1890); *Guizot's Harmony of Historic, Philosophic, and Religious Instruction in French Colleges* (1891); *Classic Text of Authorship, Authenticity of Authority applied to the Old and New Testament Scriptures* (1893).

**Samsun'** (anc. *Amisus*): town; in vilayet of Trebizond, Asia Minor; a port of large importance on the Black Sea; northern terminus of several trans-Anatolian commercial routes (see map of Turkey, ref. 4-G). It exports wool, silk, sheepskins, goatskins, wax, gums, opium, grain, fruit, wine, valonea, and tobacco. Pop. (1889) 14,500. E. A. G.

**Samuel** [from Heb. *Sh'mū'el*, for *sh'mū'a'el*, heard of God]: a Hebrew judge, lawgiver, and prophet, whose history is recorded in the first of the two biblical books of Samuel; b. at Ramathaim Zophim, in Mt. Ephraim, probably in the twelfth century B. C.; was consecrated by his mother, Hannah, to the service of Jehovah as a Nazirite before his birth; brought up in the household of the chief priest, Eli, at Shiloh; received in childhood a divine message foreboding the downfall of the family of Eli; assumed the judgeship of Israel about twenty years after the death of Eli, at which time he headed a successful expedition against the Philistines; resided at Ramah (probably the same as Ramathaim Zophim); visited annually the three principal sanctuaries, Bethel, Gilgal, and Mizpeh, and made his sons deputy judges, but in consequence of their misconduct was commissioned by Jehovah to accede to the popular clamor for a king; to which end he anointed Saul as first monarch of Israel, and on his disobedience to a divine command anointed the youthful shepherd David in his place. He died shortly before the close of the reign of Saul, and his spirit was successfully invoked by the "witch of Endor" to announce to Saul the fatal result of the battle in which he

lost his life. Samuel is regarded as the father of prophecy. This does not mean that there had been no prophets before him, but that he gave organized form and increased power to the prophetic activity in Israel. The "companies" of prophets of his own time and the "sons of the prophets" of later times probably owed their origin to him. In connection with prophetic training he gave an impetus to literary and musical culture, thus making possible the great development of these that characterized the reigns of David and Solomon.

The chronology of the life of Samuel is obscure, and great differences of opinion exist. Probably, however, he was a grown man at the death of Eli (1 Sam. iii. 19-iv. 1); then for twenty years he made his influence felt as a prophet, neither he nor Samson, nor any other man, being at that time judge of Israel (vii. 2); then for perhaps eighteen years he was judge (vii. 6, *seq.*), chief magistrate of Israel; then Saul was made king, and Samuel, being thus out-ranked, was no longer chief magistrate, though he continued to be judge till his death (vii. 15). His administration was brilliantly successful, though the accounts of it are very brief. Israel became independent of the Philistines (vii. 13-14). He settled the Amorite question, which had been a source of trouble from the time of Joshua (vii. 14). He organized the administration of justice (vii. 16-17). Though his sons failed to walk in his footsteps, he handed over to his successor a strong and prosperous nation.

Revised by W. J. BEECHER.

**Samuel, The Books of:** called in the LXX. and Vulgate the first and second books of Kings. The books of Judges and Samuel, either with or without Ruth, are a connected whole, evidently formed, to a large extent, by the process of combining earlier writings. The Talmud attributes the series to the prophet Samuel, with supplementary work by the prophets Nathan and Gad. This can not be correct in the sense that Samuel personally wrote the larger part of these books, but it is probably correct in the sense that the work was initiated by him, and dominated throughout by his spirit. In 1 Chron. xxix. 29 we are told that the affairs of King David, first and last, "with all his reign and his might, and the times which passed over him and over Israel and over all the kingdoms of the countries," are written "upon the words of Samuel the seer, and upon the words of Nathan the prophet, and upon the words of Gad the observer." Evidently, the sources thus described are either a collection of the writings whence the present series, Judges, Ruth, and Samuel, was compiled, or else that series itself, the second alternative being the more probable.

Scholars hold various opinions as to the time when the books of Samuel were composed in their present form, but really there is no reason for dating them later than the lifetime of Nathan, that is, some time in the reign of Solomon. All the many alleged reasons for assigning to them a later date fade out when closely examined.

In any case, the books of Samuel are not continuous, as a literary work, with the books of Kings, though the latter take up the history at the point where the former leave it. The author of Kings habitually names his sources (1 Kings xi. 41, xiv. 19, e. g.), passes a sentence of formal approval or condemnation on each ruler (2 Kings xvi. 2, 3, e. g.), gives his chronology in a formulated system, while the author of Samuel habitually does none of these things. And many additional particulars might be cited to show that the authors of the two series were men very dissimilar in their point of view and their literary habits.

In their contents the books of Samuel are a history of David and his reign, with a preliminary account of the calamities that preceded Samuel, the brilliant administration of Samuel himself, the establishing of the kingdom, the reign of Saul, and especially Saul's relations to David.

Revised by W. J. BEECHER.

**Samurai**, sā'mōo-rī' (literally, guard): the name given to Japanese warriors under the feudal régime. Before the Tokugawa shogunate the name included even the shōgun and daimios. The samurai were a class apart, numbering in 1870 about 400,000 families, intermarrying among themselves and having a peculiar code of honor, etiquette, and morality. The privilege of wearing two swords, withdrawn in 1876, gave them the name of "two-sworded men." The modern police and gendarmerie and the officers of the army and navy are of samurai stock. J. M. DIXON.

**Sanaa'**: city; capital of the Ottoman vilayet of Yemen, in Arabia. It is situated 7,120 feet above the level of the

**San Buena** (bōw'nā) **Ventu'ra**: city; capital of Ventura co., Cal.; on the Pacific Ocean, and the S. Pac. Railroad; 60 miles W. N. W. of Los Angeles (for location, see map of California, ref. 12-E). Its legal name, as above given, is derived from a famous old Spanish mission; its post-office designation is Ventura. It contains the ancient mission building, public high school, 2 grammar schools, public library and reading-room (founded in 1874), Y. M. C. A. building, electric light, street-railway, water, and sewer plants, several hot springs, a State bank with capital of \$100,000, a private bank, and a daily and 4 weekly newspapers. The principal industries are agriculture and fruit-growing. The equable climate and springs have made it a popular resort for invalids. Pop. (1880) 1,370; (1890) 2,320; (1895) estimated, 4,000. EDITOR OF "VENTURIAN."

**Sanchoni'athon** [Gr. Σανχωνιάθων, Σανχωνιάθων = Phœnician, *Sakkūn-yāthōn*, *Sakkūn* has given]: name of a mythical Phœnician, who is said to have lived before the Trojan war, and to have written a history of the Phœnicians. Philo Herenius of Byblos (Gabal), b. 64 A. D., pretends to have translated this book into Greek, under the name Φωνικὴ ἱστορία, or Τὰ Φωνικὰ. Fragments of this work have been preserved by Eusebius (*De Prepar. Evang.*, bk. i., chaps. ix. and x.; bk. iv., chap. xvi.) and the Neo-Platonic philosopher Porphyry (*De Abst.*, ii., 56). Sanchoniathon is also mentioned by Athenæus (*Deipnosophist.*, bk. iii., ch. c.), Theodoret (*Adv. Gentiles*, Disput. ii.), and Suidas (Müller, *Frag. Hist. Græc.*, iii., p. 561). The statement of Philo has been accepted by Grotius, Mignot, Ewald, Renan, Spiegel, and Thiele, but rejected by Dodwell, Meiners, and Hissman. Lobeck stands alone in assuming that the falsification is due to Eusebius. Modern scholars, while denying the existence of a Phœnician writer by the name of Sanchoniathon, believe that Philo has embodied in his work traditions which were current in his native city (Bunsen, Mövers, Duncker, Rawlinson, Baudissin), though the whole has more or less a pseudographic character (Baudissin, Pietschmann, von Gutschmid). The fragments extant seem to show that Philo culled from various sources. They contain two different so-called Phœnician cosmogonies, one beginning with *πνεῦμα* and *χάος*, the other with *κόλατος* and *βέαν*. Then follows an account of the rise of the human race (*φῶς*, *πῦρ*, *φλόξ*, giants, mankind), and of the beginnings of culture, drawn from three different sources. To this is added the mythical history of the city of Byblos. A still further fragment is preserved by Eusebius on τὰ ἐν γράμμασι θεοῦ διὰ τὸν ἀνθρώπου (according to Gutschmid's correction), which probably treated of the writings of the mythical Egyptian Thoth. The tendency of Philo's work, which contains Egyptian, Grecian, Phœnician, and Hebrew elements, is undoubtedly euhemeristic, and in its syncretism endeavors to prove the Phœnician origin of Greek religion. In 1836 Wagenfeld astonished the learned world with excerpts from what he claimed to be a newly found MS. of the whole of Philo's translation, *Sanchoniathons Urgesch. der Phönizier* (Hanover, 1836), but the whole was soon recognized as a fraud. See *Jahrb. für Theol.*, vii., pp. 95, seq.

**LITERATURE.**—The text is published in C. Müller, *Fragmenta Hist. Græcor.* (iii., p. 561, seq.); Orelli, *Sanchoniathonis Fragmenta* (Leipzig, 1826); transl. in Cory's *Ancient Fragments* (London, 1878, p. 1); Lenormant, *Beginnings of History* (New York, 1882, p. 524). **San Cristo'bal de los Llanos**, or **Las Casas**: formerly *Ciudad Real*; capital of the state of Chiapas, Mexico; on a plain, about 6,700 feet above the sea (see map of Mexico, ref. 9-J). It was founded in 1528 on the site of an Indian village; subsequently it was famous as the residence of Las Casas when he was Bishop of Chiapas. Pop. (1892), with the immediate vicinity, 16,050. H. H. S.

**Saneroff**, WILLIAM, D. D.: archbishop; b. at Fressingfield, Suffolk, England, Jan. 30, 1816; educated at Bury

School and at Emmanuel College, Cambridge, where he became fellow 1842; was deprived of his fellowship by the Long Parliament 1649; became chaplain to Bishop Cosin of Durham 1660, in which year he assisted, privately, in the revision of the Prayer-book; obtained from that prelate the rectory of Houghton-le-Spring and was prebendary in Durham Cathedral; was elected master of Emmanuel College, Cambridge, 1662; was promoted successively to the deaneries of York 1663, and of St. Paul's, London, 1664; spent large sums on the repair of St. Paul's Cathedral; was presented by Charles II. to the archdeaconry of Canterbury 1668, and to the archbishopric of Canterbury 1677. He attended Charles II. on his deathbed, and wrote the petition presented to James II. in 1687 against the Declaration of Indulgence. This petition was signed by himself and by six other prelates, for which they were committed to the Tower June, 1688, tried for misdemeanor before the king's bench, and acquitted June 29, 1688. Notwithstanding his grievances, he did not take part in the conspiracies against James; refused to take the oath of allegiance to William and Mary; was deprived of his see Feb., 1691; refused to recognize his deposition; retired to his native place, and attempted, with the aid of the numerous nonjuring clergy, to maintain an episcopal succession. D. at Fressingfield, Nov. 24, 1693. He was the author of several volumes of sermons, letters, and political essays. Many of his unedited MSS. are in the Bodleian Library, Oxford. Revised by W. S. PERRY.

**Sanctification** [from Lat. *sanctifica'tio* (deriv. of *sanctifica're*, sanctify; *sanctus*, holy + *fa'cere*, make), trans. of Gr. ἁγιάζω, hallow, make holy, deriv. of ἅγιος, holy]: the work of God's grace by which those who believe in Christ are freed from sin and built up in holiness. In Protestant theology it is distinguished from justification and regeneration, both of which lie at its root, and from neither of which it is separable in fact; inasmuch as the term justification is confined to the judicial act or sentence of God, by which the sinner is declared to be entitled, in consideration of what Christ has done in his behalf, to the favor of God, and of which sanctification is the efficient execution; and the term regeneration is confined to the initial efficient act by which the new life is imparted, of which sanctification is the progressive development. Both regeneration and justification are momentary acts, and acts of God in which the sinner is passive; sanctification, on the other hand, is a progressive work of God, in which the sinner co-operates.

The nature of sanctification, as well as its method and the relation of the divine and human factors in its prosecution, is differently conceived by the several types of theology.

1. The *Pelagian and Rationalistic view* excludes the action of the Holy Spirit altogether; and makes sanctification to be nothing more than continued right action, in the native powers of the free moral agent, by which he gradually conquers evil tendencies, and builds up a holy character.

2. The *Medieval and Roman view* refuses to distinguish between justification and sanctification; and makes both justification and sanctification to be the cleansing from sin, and the infusion of gracious habits by the Holy Ghost for Christ's sake by the instrument of baptism, upon which subjective change the removal of guilt and the divine favor is conditioned. (*Counc. Trent*, sess. 6, can. 7.) It is therefore held to be progressive, and to be advanced by good works, which possess real merit, and deserve and secure increase of grace (*Counc. Trent*, sess. 6, can. 32); as well as by penances, prayers, fastings, etc., which satisfy God's justice and purify the soul. (*Counc. Trent*, sess. 14, ch. viii.; sess. 6, cans. 29 and 30.) If the believer dies before the process of deliverance from sin is perfected, he must complete it in purgatory, the pains of which are expiatory and purifying; and there he may be assisted by the prayers and masses and dispensing power of the Church on earth. (Bellarmin, *Purgator.*, ii., 9.) But it is possible, even before death, for a believer perfectly to conform to all the demands of God's law as graciously adjusted to this life (*Counc. Trent*, sess. 6, ch. xvii., can. 25); and it is even possible, out of love, to perform supererogatory service by obedience to the councils of Christ, which are advisory but not obligatory until voluntarily undertaken. These are voluntary poverty, celibacy and obedience to monastic rule; and they merit more than the mere salvation of the person, and contribute to the "treasury of merits" at the disposal of the Church, which is imputable at the discretion of those holding the jurisdiction to believers on earth or in purgatory not yet fully justified. Bellarmin, *De Monachis*, chaps. vi. and vii.

de la Lyre (1840), and especially *Horace* and *Consuelo* (1842), *La Comtesse de Rudolstadt* (1843), *Le Moulin d'Angibault* (1845), *Le Pêché de Monsieur Antoine* (1846), etc. In *Jeanne* (1844) she returned to the purely artistic novel without any tendency, and there followed some of her most beautiful productions—*La Petite Fadette* (1849), *La Mare au Diable* (1846), *François le Champi* (1848), etc.—but in 1848 she plunged with enthusiasm into the very midst of the Revolution—wrote proclamations and founded newspapers. After the Revolution she wrote during a long period chiefly for the theaters, and some of her plays were very successful. They are, nevertheless, nothing but dramatized novels, without any genuine dramatic effect. She was most successful with the novel, more especially the descriptive and reflective novel, and in this genre even her latest books, *Mlle. la Quintinie* (1863), *Le Marquis de Villemer* (1864), *La Confession d'une Jeune Fille* (1865), *Cadio* (1868), are brilliant and powerful productions. D. June 8, 1876. Her collected works contain *Romans et Nouvelles* (84 vols.); *Mémoires, souvenirs, impressions, voyages* (8 vols.); *Théâtre* (4 vols.); *Théâtre de Nohant* (1 vol.); *Correspondance* (10 vols., 1882-84).  
Revised by A. G. CANFIELD.

**Sandal-wood** [*sandal* is from Arab. *qandal*, from Sanskr. *candana*, sandal-tree]: the agreeably aromatic and precious wood of several trees belonging to the genus *Santalum* and of one or two other trees. The original sandal-wood of India is yielded by *Santalum album*, a tree 25 feet high, with a trunk a foot in diameter. Three kinds or hues were known in Europe as early as the eleventh century—white, yellow, and red, of which the last-named may have been confounded with the inodorous wood of red sanders or *SANTAL-WOOD* (q. v.). After the discovery of the Sandwich islands a large part of the supply of the sandal-wood of commerce came from two or three species of *Santalum* peculiar to those islands, and later from *S. yasi* of the Fiji islands and from *S. austro-caledonicum* of New Caledonia; also from *Fusanus spicatus*, a tree of Western Australia of the same family. The high price this wood brings has caused the reckless extirpation of the tree from the more accessible stations, but in India the original sandal-wood tree is protected by the Government. It is employed as a perfume and for the fabrication of small articles—glove-boxes, caskets, etc. Much is consumed in India in the celebration of sepulchral rites and for medicinal purposes, where the powder, made into a paste with water, is used for making the caste-mark. The principal market is China, where it is most largely used for incense in temples, etc. The Malabar sandal-wood there brings three or four times the price of that of the South Sea islands. The wood yields 1 per cent. of a peculiar essential oil, on which the characteristic fragrance depends. This oil, largely extracted in some parts of India from the fresh wood, has been used in medicine as a substitute for copaiba. The famous and richly carved gates of the temple of Somnauth, supposed to be 1,000 years old, are of sandal-wood. See **SANDALWORTS** and **DYESTUFFS**.  
Revised by CHARLES E. BESSEY.

**Sandalworts**: the *Santalaceae*, a small family of apetalous dicotyledonous plants widely distributed over the world. It is most nearly related to *Loranthaceae*, but incompletely, if at all, parasitic, according with that family in having its ovules and seeds destitute of integuments. The sandal-woods (see **SANDAL-WOOD**) are far the most important representatives of the family. The European species are all herbs, as are the members of *Comandra*, the commonest North American representative; but the Alleghanies have two shrubby genera; one of these, *Pyrularia*, oil-nut, has a large kernel abounding with acrid oil. The quandang-nut of Australia, however, is bland and edible. The Australian cherry (so called), with the stone on the outside, is the nut of an exocarpus, supported on an apparent succulent red berry, which is formed by an enlargement of the tip of the flower-stalk.  
Revised by CHARLES E. BESSEY.

**Sandarach** [via O. Fr. from Lat. *sanda'ra* = Gr. *sarabdarach*, sandarach, realgar, an Eastern word, probably borrowed ultimately from India. Cf. Sanskr. *sindūra*]: a gum-resin from a small coniferous tree, *Thuja articulata*, which grows in Barbary. It occurs in pale-yellow oblong grains or tears, covered with a fine dust, is transparent and brittle, with a vitreous luster on the fracture. According to Unverdorben and Johnston, it consists of three resinous acids. The  $\alpha$ -resin forms a white or yellow powder slightly soluble in alcohol and not easily fusible, and is present in but small quantities. The  $\beta$ -resin forms about three-fourths of the

whole, is light yellow, softens at 212° F., and is readily soluble in cold alcohol. The  $\gamma$ -resin is a light-yellow powder, soluble in boiling alcohol, and melts with difficulty, decomposing at the same time. In medicine, sandarach was formerly given internally, and entered into the composition of various ointments and plasters. It is chiefly used as an incense and in varnishes. Its powder is rubbed on writing-paper where erasures have been made, in order to prevent the spreading of ink.  
Revised by IRA REMSEN.

**Sand Beach**: village; Huron co., Mich.; on Lake Huron, and the Flint and Pere Marquette Railroad; 70 miles N. of Port Huron, 120 miles N. by E. of Detroit (for location, see map of Michigan, ref. 6-L). It occupies an elevated site, which slopes back from the lake by a series of terraces; has excellent natural drainage and a good system of water-works; contains valuable mineral springs and large bath-houses; and has considerable dairy, salt, flour, lime, and lumber interests. The U. S. Government has constructed a costly harbor of refuge for the shipping of the Great Lakes. The village has a private bank and two weekly newspapers. Pop. (1890) 1,046; (1895) estimated, 1,500.  
EDITOR OF "HURON TIMES."

**Sand-blast**: a stream of sand propelled by the pressure of air or steam and used for cutting and engraving glass, stone, and other solid substances. The process was invented by Gen. Benjamin C. Tilghman, and was suggested by the well-known effect of wind-blown sand in destroying the transparency of glass. In practice, two kinds of work are performed by the sand-blast, called, respectively, heavy and light work. For the former a high pressure and a correspondingly great velocity are required; for the latter the pressure is light and the velocity low. Ordinarily, for light work, the necessary velocity is given to the sand by means of an air-blast produced either by a rotary fan or positive blower, or by the pressure of the atmosphere acting toward a vacuum maintained by a fan or a steam-jet. For simply depolishing glass or making the so-called ground glass, the current of air is conducted into a rectangular trough of any desired length, narrowed at the bottom to an opening an inch wide, and having its top perforated by small tubes for the admission of the sand. The glass is carried slowly across the opening of this jet, and about an inch below it, by means of a traveling apron. By this process glass is obscured with great rapidity, almost as soon as it is held in position. In order to engrave a design upon the glass, the parts which are to remain bright have to be protected with a composition or by blotting-paper, soaked in glycerin and glue, from which the desired pattern has been cut out.

For heavy work either air or steam may be used; but steam is more readily employed, and, as it cuts twice as fast as air under the same pressure, is generally preferred. The steam is used in a jet, technically called the blast-pipe or gun. As shown in the accompanying sectional drawing, it consists of a hollow bronze cylinder of about 1½ inches external diameter, having a lateral opening near its upper end (by which the steam enters), and tapering somewhat at its lower. Through the top of this cylinder an iron tube passes, secured by a stuffing-box. This is called the sand-tube; its exterior diameter is somewhat less than that of the opening through the cylinder, and it tapers with it at its lower end, though somewhat less rapidly, thus leaving a narrow concentric aperture for the passage of the steam. The exterior cylinder is prolonged beyond this concentric opening to form a socket for a supplementary or directing tube called the nozzle-tube (seen separately on the right). This tube, being the only portion of the blast-pipe which is exposed to wear, is made of sheet-steel, or sometimes of chilled iron. The sand used should be sifted so as to be of uniform size, and should be clean, hard, sharp, and dry.

the Covenant, and had his living sequestered; attended the king as ecclesiastical councillor at Oxford, at Hampton Court, and in the Isle of Wight; was ejected from his professorship 1648, but restored 1660, and shortly after made Bishop of Lincoln, and took part in the Savoy Conference 1661. D. at Lincoln, Jan. 29, 1663. He was the author of several Latin treatises on cases of conscience, the obligation of an oath, etc., written for the guidance of Charles I., and other tracts, collected in his *Works* (Oxford, 1854; 6 vols.), edited by Bishop Jacobson. His *Life* was written by Izaak Walton. His sermons are masterpieces.

Revised by W. S. PERRY.

**Sanderson, SYBIL**: opera-singer; b. at Sacramento, Cal., in 1864; passed her childhood in San Francisco, and took her first lessons in singing under local teachers. In 1881 she went to Paris and entered the Conservatory; studied later under Jules Massenet, the opera-composer. On May 15, 1889, made her *début* in Paris in Massenet's *Esclarmonde*, which was composed for her. In the previous year she had appeared at The Hague as a test under the name of Ada Palmer. In 1890 she sang in Brussels, in 1891 in London, and in 1892 in St. Petersburg. In 1893 she created the rôle of Phryne in Saint-Saëns's opera of that name. In 1894 she was engaged for the season at the Metropolitan Opera-house, New York, and made her first appearance there on Jan. 16, 1895, in Massenet's *Manon*. Her voice is a clear, brilliant, high soprano.

D. E. HERVEY.

**Sandersville**: city: capital of Washington co., Ga.; between the Oconee and the Ogeechee rivers, and on the Augusta Southern Railroad; 64 miles N. by E. of Macon, 135 miles N. W. of Savannah (for location, see map of Georgia, ref. 4-I). It is the center of a large cotton-growing region, and contains a private bank and two weekly newspapers. Pop. (1880) 1,279; (1890) 1,760.

**Sand-grouse**: a name applied on account of their habitat to the birds of the family *PTEROCOLIDÆ* (q. v.).

**Sandhopper, or Beach-flea**: names given, in allusion to their power of leaping, to various amphipod crustaceans found under sea-wrack near the high-tide mark. Most of the many known species belong to the genus *Orchestia*, as the common species of the New England coast, *O. agilis*. They are known also as sand-fleas and shore-jumpers.

*Orchestia agilis* (magnified).

**Sandhurst**: village; in Berkshire, England; 33 miles W. S. W. of London (see map of England, ref. 12-J). It is the seat of the Royal Military College and the Staff College. See MILITARY ACADEMIES.

**Sandhurst, or Ben'digo**: city of Victoria, Australia; third in size in the colony; 90 miles N. of Melbourne, on Bendigo creek, 760 feet above the sea-level; an important railway junction (see map of Australia, ref. 8-H). It is well built, and contains many public edifices, a fine botanic garden, and five large reservoirs of water. It is in the center of a rich gold-bearing region, and the district produces highly esteemed wines and considerable quantities of cereals, especially barley. The mining industry gives employment to about 7,000 persons, and one of the mines, the Lansell, has reached a depth of over 2,500 feet, the deepest on the continent. The climate is hot and variable; a maximum temperature of 126° F. in the shade has been observed. The mean annual rainfall is 24 inches. Pop. (1891) 37,238.

MARK W. HARRINGTON.

**San Diego**, -di-ā-gō: city; port of entry; capital of San Diego co., Cal.; on San Diego Bay and the National City and Otay, the San D., Cuyamaca and East., and the S. Cal. railways; lat. 32° 41' N., lon. 117° 13' W.; 480 miles S. E. of San Francisco (for location, see map of California, ref. 13-G). The bay, discovered by Cabrillo in 1542, is pronounced next in excellence on the Pacific coast to that of San Francisco. The first settlement was made in May, 1769, when Father Junipero Serra established here the first of the California missions, that of San Diego; but the present city dates in growth from 1867, when the new town was begun on the water front of the bay. The climate is the mildest and most uniform known, and has made the city a popular resort for invalids from all parts of the U. S. San Diego County is the principal honey-producing county in the State, and markets in the city

large quantities of wheat, wool, honey, fruit, and live stock. There are several gold mines within 50 miles of the city. The principal industry of the region is fruit and nut culture, inaugurated in 1869, and represented by over 2,000,000 trees. The city contains 3 public parks, one with 1,400 acres; U. S. custom-house; free public library (founded in 1882); public-school district library; county hospital; 16 public-school buildings; public-school property valued at about \$200,000; Academy of Our Lady of Peace (Roman Catholic); board of trade and chamber of commerce; gas and electric lights; electric street-railways; water-works; 2 national banks with combined capital of \$400,000, 3 State banks with capital of \$180,000, and a private bank; and 2 daily, 5 weekly, and 4 monthly periodicals. There are several flour and planing mills run by steam-power, large saw-works, factories for carriages and wagons, foundry and machine-shops, a tannery, and other industries. The city has an assessed property valuation of over \$14,000,000, and a bonded indebtedness, chiefly incurred for improved sewerage, of \$375,000. On the peninsula on the opposite side of the bay and connected with the city by steam ferry is Coronado Beach, which contains many fine residences and a hotel with accommodations for 1,200 guests, costing nearly \$1,000,000. Pop. (1880) 2,637; (1890) 16,159; (1894) estimated, 20,000.

H. W. TALCOTT.

**Sand-lance**: See SAND-EEL.

**San Domingo**: See SANTO DOMINGO.

**Sandpaper**: paper one side of which is covered with glue, upon which sharp sand or powdered glass has been evenly sifted and is held by the glue when dry. It is made of many grades and degrees of fineness, and is used in smoothing the surface of wood, by the carpenter and joiner, when giving it its final finish.

**Sand Piles**: See FOUNDATION.

**Sandpiper**: any one of several small birds of the family *Scelopacidae*, that frequent sandy shores and utter a pipping note. They have a bill about equal to the head in length, covered with a soft skin; the toes, four in number, except in *Calidris*, the hindmost being very small. They are mostly distinguished from the true snipes by their shorter bills and uniformly colored tail-feathers. They are mainly birds of the northern hemisphere, and breed far north, occurring at times in great flocks during their fall migrations. They feed along the shore, picking up small crustaceans, molluscs or insects, or probing for them in the mud.

There are about twenty-five species, some of wide range, twenty of which occur in North America, although one or two, like the ruff (*Machetes pugnax*) and the spoon-bill sandpiper (*Eurynorhynchus pygmaeus*), are stragglers from other regions. Among the most common is the spotted sandpiper (*Actitis macularia*), familiarly known as tip-up, which breeds in many parts of the U. S., often at some little distance from the water, and is not so gregarious as most species. The broad-billed sandpiper (*Tringa platyrhynchos*) is an Old World species.

**Sands, BENJAMIN FRANKLIN**: rear-admiral U. S. navy, b. in Baltimore, Md., Feb. 11, 1811; entered the navy as a midshipman Apr. 1, 1828. Served on the east coast of Mexico during the war with that country; commanded the steamer Fort Jackson in both the Fort Fisher fights in the civil war; promoted rear-admiral 1871. He was long identified with the building up of the U. S. Naval Observatory. He served as an assistant in the very earliest days of that institution, and it was through his earnest efforts that it was equipped with what was then the largest telescope in the world. During his superintendency the observatory ranked among the highest of similar institutions. See Report No. 726, House of Representatives, 52d Congress, first session, Naval Observatory. D. at Washington, D. C., Dec. 30, 1883.

pany, of which he became treasurer 1619; was instrumental in securing a charter for the Pilgrims of the Mayflower and in establishing representative government in the colony of Virginia, thereby becoming obnoxious to the "Spanish party" at court, and was imprisoned, along with Selden, 1621, for having opposed the royal projects in Parliament. D. at Northborne, Kent, in Oct., 1629. He founded a lectureship on metaphysics at Oxford, and wrote at Paris, in 1599, *Europæ Speculum, or a Survey of the State of Religion in the Western Part of the World*, which passed through many editions. A volume of *Sacred Hymns* (1615), containing translations of 50 select Psalms, is attributed to him.

**Sandys, George:** English traveler and author; b. at Bishopsthorpe, York, in 1577; educated at St. Mary's Hall and Corpus Christi College, Oxford; traveled through various parts of the Turkish empire 1610-12; published a *Relation* of his journey (1615), with illustrations, often reprinted, and considered of great value by Orientalists; went to Virginia as colonial treasurer 1621; completed at Jamestown a translation of Ovid's *Metamorphoses* (1626), of which the first five books had previously appeared; built the first water-mill, and promoted iron-manufacture and ship-building in Virginia; returned to England 1624; printed poetical paraphrases of several books of the Old Testament, and translated from the Latin of Grotius the tragedy of *Christ's Passion* (1640); was for some years gentleman of the privy chamber to the king, and passed his latter years at Bexley Abbey, Kent, where he died in Mar., 1644. A *Life* was published by Rev. H. J. Todd, prefixed to a *Selection from Sandys's Metrical Paraphrases* (1839), and a complete edition of his poetical works, with introduction and notes, was published in 1872 by Rev. R. Hooper.

**San Felipe de Linares:** usually called LINARES (*q. v.*).

**San Felipe de los Andes,** -fā-lēe'pā-dā-lōs-aan'dās, or **de Aconcagua,** dā-nā-kōn-kaa-gwā: capital of the province of Aconcagua, Chili; in a valley at the foot of the Andes; 50 miles N. N. E. of Santiago, with which it is connected by railway (see map of South America, ref. 8-C). It has a considerable trade over the Andes with the Argentine Republic. Pop. (1885), 11,768. H. H. S.

**San Fernan'do,** formerly **Isla de Leon:** fortified maritime city of Spain; 9 miles by rail S. E. of Cadiz; on the low island of Leon (see map of Spain, ref. 20-C). It is a modern town with an arsenal, an observatory, hospitals, and barracks for troops. The population consists chiefly of Government employees, and the only industry is the extraction of salt from the neighboring tidal marshes. Pop. about 27,000. M. W. H.

**Sanford:** city; Orange co., Fla.; on Lake Monroe, an enlargement of the St. John's river, and the Jack., Tam. and Key W., the San. and Ind. Riv., the San. and St. Petersb., and the Sav., Fla. and West. railways; 125 miles S. of Jacksonville (for location, see map of Florida, ref. 4-J). It is at the head of large steamer navigation on the river; is an important shipping-point for oranges and for early vegetables and fruit consigned to Northern markets; and contains 10 churches, 2 public schools, railway car-shops, machine-shops, wood-turning mills, cigar and fruit-preserving factories, a national bank (capital \$50,000), an incorporated bank (capital \$31,000), and a weekly paper. It was founded by Gen. H. S. Sanford in 1870. Pop. (1890) 2,016; (1895) estimated, 3,000. Editor of "GATE CITY CHRONICLE."

**San Francis'co:** city, metropolis, and chief seaport of California; coextensive with San Francisco County; on the end of a peninsula 6 miles wide and 20 miles long, separating the south arm of San Francisco Bay from the Pacific Ocean, and on the N. Pac. Coast, the San Fran. and N. Pac., the S. Pac. railways (of which only the last named has a line running directly into the city); lat. 37° 48' 26" N., lon. 122° 24' 39" W. (for location, see map of California, ref. 7-B).

**Site, etc.**—Its area is 42 sq. miles, including, besides the entire end of the peninsula across to the ocean, Goat island, with 141 acres, 2 miles E. of the peninsula; Alcatraz island, with 30 acres, 1 mile N. of the peninsula; and the Farallones, six rocky islets, 24 miles off shore in the ocean. Nearly half the area consists of high rocky hills, rising in several points to 800 feet above the sea. The site has much level land, but a large part of this has been supplied by art, the original inequalities of the surface having been graded away. The harbor is part of a bay 50 miles long and 5 miles wide, deep, landlocked, and most beautiful. The city

is supplied with water from Pilarcitos valley, 20 miles to the S., where the rain-water is caught in a large reservoir, and artesian water is found at depths varying from 120 to 160 feet, though from many wells water must be raised by pumping. The city is laid off in rectangular blocks, separated by wide streets, which in the north run with the cardinal points of the compass, and in a portion of the south with the semi-cardinal points. Market Street, which separates the two main surveys, 125 feet wide and 3 miles long, is one of the most important and imposing business streets in the world. Among remarkable features are the peninsular position, fronting to the W. on the Pacific Ocean, to the E. on the bay, and to the N. on the Golden Gate; the wooden architecture in the residence district; the hilly site; the excellent street-car system, with cables over many of the hills; Chinatown; the fruit-market, wonderful in variety and abundance of its supplies; the wharf for Italian fishing-boats; the Seal Rocks, with their sea-lions at the entrance of the harbor; Sutro Heights, a pleasure-garden kept open to the public by Adolph Sutro; the Sutro bath-house; the numerous large hotels; and the peculiar climate, which permits the fuchsia and geranium to blossom in the open air of mid-winter while it compels the wearing of overcoats in mid-summer. Golden Gate Park has an area of 1,050 acres, with abundant evergreen vegetation of beautiful form and color, excellent drives, commodious and elegant buildings for public entertainment, creditable statuary, a highly varied site, a steep hill 900 feet high on the S., and a magnificent ocean beach and surf at its west end.

**Climate.**—There is almost unbroken coolness of temperature by breezes fresh from the ocean every day. The annual death-rate for each 1,000 inhabitants is 20, a proportion exceeded in most other seaport cities of equal size. The heavy fogs in summer are pernicious to asthmatics, and consumptives find better climates in other parts of the State.

**Buildings.**—The city-hall, though unfinished at the close of 1894, had cost \$5,000,000. It is the largest building of the city in ground plan. Its material is brick, covered in front with stucco. The branch mint has an imposing front of gray limestone in the Greek style of architecture. The Palace Hotel, of brick, seven stories high, cost with its site \$31,000,000, and is one of the largest and most famous hotels of the world. Other notable buildings are the Academy of Sciences, the Pioneer Hall, both endowed by James Lick; the Cooper Medical College and Lane Hospital (in adjoining buildings); the Hopkins Art Institute, given to the State by E. F. Seales; the Mills building, twelve stories, of brick and stone, with a framework of steel, erected at a cost of \$1,000,000; and several other high buildings of similar construction. The prevalent style of architecture is highly ornamental, with a great multitude of bay-windows designed to catch as much sunlight as possible. The material of nine-tenths of the dwelling-houses and of many of the factories is wood.

**Institutions.**—As an important seaport San Francisco has a large custom-house, a national marine hospital, a national military post (the Presidio), and on the northern border of the peninsula, and also on Alcatraz and Goat islands, extensive fortifications. The city has a large number of churches and educational and philanthropic institutions. The Mechanics' Institute has property valued at more than \$1,000,000; the Academy of Sciences had an endowment of about \$600,000 from the estate of James Lick, and the Lick Mechanical Art School one of \$540,000.

**Government.**—The city council (consisting of a board of twelve members, known as the board of supervisors) and the chief executive officers, including mayor, auditor, treasurer, assessor, sheriff, recorder, county clerk, public administrator, and coroner, are elected biennially. The expense of the municipal government in the fiscal year ending June 30, 1894, was \$5,370,000 (\$19 for every resident), including \$1,080,000 for schools, \$600,000 for police, \$400,000 for the fire department, and \$650,000 for repairing, cleaning, and lighting the streets. The debt in excess of the sinking fund was \$260,000, and the assessed value of property \$342,000,000.

**Manufactures.**—The city has numerous large manufacturing establishments, including a rolling-mill, machine-shops, foundries, shipyards, wire-works, ropewalk, planing-mills, sugar-refineries, and factories for carriages, furniture, boxes, shoes, clothing, tinware, etc. The gross value of the products manufactured in 1894 was estimated at \$90,000,000, including refined sugar, \$18,000,000; glass, \$8,000,000; clothing and shoes, \$8,000,000; furniture and

San Francisco Mountain. The highest mountain in the range is 10 27' N., 111° 40' W., altitude, 12,800'. It stands alone rising abruptly from the Colorado

It is a length of 2,000 feet and is a comparatively land-locked, calm sea. Near it are the lesser cities of Malabar, Kowshik, and Sugrivas. Its base is 10 miles across, and its crest takes the form of a crescent, with

is composed of fused to the shell. Geologically, it is partly composed of corals and partly a remnant of a circumbelt. The upper part is composed of lava, which was melted before the photo had been degraded to its present

The tough lava appeared a more stubborn resistance to the great stream than did the sedimentary rocks of the area, and consequently held its own while the latter were being eroded. It protected and preserved that portion of the country which is now the site of the city of Los Angeles.

The lava flows were covered by a thin layer of ash and sand. The lava flows were covered by a thin layer of ash and sand. The lava flows were covered by a thin layer of ash and sand.

The fragment of a Graal romance, *Joseph of Arimathea*, exists in English alliterative verse of the fourteenth century, and has been edited for the Early English Text Society by Rev. W. W. Skeat (1871). H. A. BEERS.

**Sangster**, CHARLES: poet; b. near Kingston, Ontario, Canada, July 16, 1822, and educated there; was editor of the *Amherstburg Courier* and Kingston newspapers for fifteen years, and in 1868 became attached to the Post-office Department, Ottawa, from which he was retired in 1886. He published *The St. Lawrence, The Saguenay, and other Poems* (1856), *Hesperus and other Poems and Lyrics* (1860).

**Sanguinalia**: a genus of plants containing one species, *S. canadensis*. See BLOOD-ROOT.

**San'hedrin**, incorrectly but commonly **Sanhedrim** [from Heb. *san'hedh'rin*, from Gr. *συνεδριον*, assembly; *σιν*, with, together + *εδρα*, seat]: either of two councils of the ancient Hebrews.

A. *The Great Sanhedrin*.—The Jewish tradition traces its origin to the seventy councilors appointed by Moses (Num. xi. 16-25; comp. Ex. xviii. 13-26), and asserts, without proof, its existence at all periods of the nation's history until after the destruction of Jerusalem by the Romans. The earliest reliable trace of its existence is under the Maccabees (2 Macc. i. 10; iv. 44; xi. 27; 1 Macc. xii. 6). It was in full activity at the time of Herod (Joseph., *Ant.*, xiv. 9-4), and we find constant mention of it in the New Testament (Matt. xxvi. 59; Mark xiv. 5, xv. 1; Luke xxii. 66; John xi. 47; Acts iv. 15, v. 21, 27, 34, vi. 12, 15, xxii. 30, xxiii. 1, 6, 15, 20, 28). It was the supreme "privy council" of the Jews; not only their court of final appeal and last resort, but also an executive and legislative assembly, shaping the general polity of the nation. Its power in matters civil and religious was practically unlimited. It decided all cases brought upon appeal from the lower courts; it had authority over kings and high priests; in it was vested the trial of heresy, idolatry, false prophecy (hence the active part it took against our Lord); and it alone had power to pronounce sentence of death. Its active jurisdiction was confined to Judæa, but the Jews in all parts of the world seem in some degree to have recognized its authority. Owing to the inability to check the constant disorders during the last years of the Jewish commonwealth, its power was greatly curtailed by the Romans, and three years before the death of Christ the right of executing sentence of death was denied, save when confirmed by the Roman authorities (John xviii. 34). In the unsettled condition of affairs attending the fall of Jerusalem it found itself unable to execute civil authority, and from that time until its extinction in the third century its power was merely nominal.

It had seventy-one members chosen from those who were distinguished in birth, learning, or position. In the New Testament are mentioned (1) priests (*ἀρχιερεῖς*), chiefs of different orders of priests; (2) elders (*πρεσβύτεροι*), those venerable from age or position; (3) scribes (*γραμματεῖς*), those learned in the law and tradition. Its officers were president (*Nasi*, chief); first vice-president (*Ab-beth-din*, father of the court); second vice-president (*Ilhakam*, judge); besides a force of secretaries and court officers (Luke xxii. 52). The members sat in a semicircle in a room immediately adjoining the temple, called *הבית הריבתי* (hall of squares).

Their meeting in the house of the high priest for the trial of our Lord does not seem to have been legal. After the fall of Jerusalem they removed to Tabneh, and finally to Tiberias, where the Sanhedrin became extinct A. D. 425.

B. *The Lesser Sanhedrin*.—A court of twenty-three members appointed by the Great Sanhedrin, sitting in all towns of over 120 households, with jurisdiction over local, civil, and criminal matters. See Matt. v. 22, x. 17; Mark xiii. 9.

LITERATURE.—Selden, *De Synedriis et Prefecturis Juridicis Veterum Ebraeorum* (1650), a mine of learning and the great source from which all knowledge of this subject is drawn, but containing a mass of irrelevant matter; Ugolini, *Thesaurus*, vol. xxv.; Lightfoot gives much valuable information, derived from the Talmud and Mishna (see *Works*); cf. Schürer, *The Jewish People in the Time of Christ*, Eng. trans., second division, i., pp. 163-195.

Revised by S. M. JACKSON.

**Sanitary Commission, The United States**: an organization formed during the civil war for the purpose of distributing relief to the soldiers of the Union army. On Apr. 15, 1861, the day of President Lincoln's call for 75,000 men,

the women of Bridgeport, Conn., organized a society with the somewhat vague idea of affording relief and comfort to the volunteers. In Charlestown, Mass., on the same day, and at Lowell a few days after, the women of those cities formed similar societies. On Apr. 19 the ladies of Cleveland, O., organized an association for the care of the families of volunteers. The Women's Central Relief Association (founded at a public meeting in the Cooper Union, New York, Apr. 29, 1861) sent a committee to Washington to confer with the medical bureau and the War Department in order to learn more definitely in what way, with least embarrassment to the Government and most help to the army, the women could serve the volunteers. They presented to the Government their plan, based very much on the sanitary commission of Great Britain, asking for the appointment of a scientific board, to be commissioned with ample powers for visiting all camps and hospitals, advising, recommending, and, if need be, enforcing, the best-known and most approved sanitary regulations in the army.

The Government not unnaturally dreaded the possible collision of such a body with the medical and military authorities, and required that the consent of the medical bureau should be obtained before such a commission was appointed. This consent was denied. The best that could be secured was the appointment of a doubtful semi-official commission, with the privilege of advising with the medical bureau, of visiting the army in the field, and of recommending to the War Department sanitary regulations and reforms. A few things soon became obvious, and guided their course:

1. The great object of such a commission must be to develop, strengthen, and support the regular medical and military authorities and methods—to stimulate the departments having the supply of food, transportation, camp equipment, drainage, and incite them by kind and wholesome criticism and counsel, and by the force of public opinion, to do their utmost to prevent pestilence and the spread of scurvy, and the lessening of needless exposures of every kind.

2. The Sanitary Commission became very early in its history thoroughly convinced that to prevent evils to the health of the army was greatly more important and serviceable than to attempt to cure them after they appeared. It accordingly gave its attention chiefly to prevention, by a system of camp-inspection and the promulgation of counsels touching the choice of camp-sites, the importance of drainage and police, and the character and cooking of food. By the appointment of skilled medical inspectors it established at once an advisory and tolerably friendly relation with the surgeons in the field.

Among the policies of the Sanitary Commission was the prevention of incompetency, inefficiency, and contracted ideas in the medical bureau. Another preventive measure which it inaugurated was the erection from its own models of pavilion hospitals, designed to make contagion and pestilence less easy and fatal. Its plans became the type of the great general hospitals which were erected at the base of the Union armies.

One of the earliest services of the Commission was the establishment of soldiers' homes at the chief places where new regiments were concentrating, to take care of the sick and supply the defects in the unperfected arrangements of the quartermaster's bureau for receiving them.

As soon as the capture of Fort Donelson the Commission, finding the Government transportation of the sick to hospitals very rude and inadequate, began to organize a system of hospital steamers. These boats, supplied with every comfort, with surgeons and nurses, plied between the ports nearest to the seats of war and the nearest general hospitals, and transported in comparative comfort tens of thousands of sick and wounded men. The cars in which the largest portion were transported were places of torture to wounded men. The Commission devised a sort of hospital-car, in which the common stretcher upon which the wounded man was carried from the field could be converted into a hanging bed in the car. The car was so hung on gutta-percha springs as to obviate jolting.

The wants of the hospitals and camps very early in 1861 had exhausted 60,000 articles which had been forwarded to the Commission. By September of that year it became plain that a demand for extra food and extra clothing was going to exceed anything that the unorganized and intermittent beneficence of the people would furnish. The organization of over 7,000 aid societies, which offered opportunities to millions of women to take some active share in the war, was one of the Commission's best services. On Sept. 5, 1861,

On 12 October 1964, the 1st Cavalry Division, "fighting as hard as they could," again suffered from the heavy Communist attack. The 3rd Battalion, 4th Cavalry, the 1st Battalion, 11th Cavalry, and the 2nd Battalion, 11th Cavalry, were all involved in a particularly bloody battle. The 1st Battalion, 11th Cavalry, was the first to be hit and was almost completely destroyed. The 2nd Battalion, 11th Cavalry, was the next to be hit and was almost completely destroyed. The 3rd Battalion, 4th Cavalry, was the last to be hit and was almost completely destroyed. The 1st Battalion, 11th Cavalry, was the first to be hit and was almost completely destroyed. The 2nd Battalion, 11th Cavalry, was the next to be hit and was almost completely destroyed. The 3rd Battalion, 4th Cavalry, was the last to be hit and was almost completely destroyed.

The *Massachusetts Freeman*—This was an organized effort to educate and keep the race of the African of all periods of the period through the general hospitals so that they could be able to know where to go for help and what to do when they were in need of help. The first of these was established in 1848 at Washington and the second in 1850 at New York.

of education, and Washington Agency—this agency, of education, is sending out agents to the 4000 islands of the Pacific, or more, to a length of 10,000 miles, to see how many can be put among soldiers passing the Hawaiian Islands, of the Constitution.

One of the most important duties was one of the duties assigned to the Secretary Commission. It regarded the preparation of a plan and successful of several position, under the direction of the Secretary Commission, as most important, and the general impression in the country and reported to the Secretary Commission in the summer of 1908. The plan was to be prepared by the Secretary Commission. The Secretary Commission, with a few exceptions, in regard to the preparation of the Commission as might be suggested by the Secretary Commission for improvements in the position.

... The earliest and ... The commission was June 21, 1904, the ... to the people at large the ... In May, 1902 it looked ... distant for want of ... 1905, and ... the ... was 1906.

1986 by telephone, dated San Francisco Sept. 16, 1987. Supplies had been reaching from all participation in the recent emergency to move and help those there. This seemed a full blown effort undertaken for a humanitarian purpose. I said that these other emergency health centers and supplies were pooling in their effectiveness and with such an effort could be a great success in the near future but the program. In the beginning of 1988 a series of great facts was presented, rather an outline of the composition of the 100,000 people in all of the countries of the United Nations, composed of 110 members. This occurred in January, Cleveland, Cleveland, Cleveland, Albany, Baltimore, Boston, Brooklyn, New York, Philadelphia and many other towns and cities. The total reached \$2,500,000. The total amount to receive was sent from the people from the National Commission in April, May, 1988, was \$2,500,000. The total amount to receive was raised and expected in the interest by the members. The transportation for health and emergency supplies and communication by telephone, press and the organization of food, health care of the cost to those departments of the world. The complete value of the services rendered by the public to the Commission has been estimated at \$2,000,000.

*Industrial chapters follow.*—The original board consisted of nine persons, with power to add as many more according to their demand there. The order of the North-Hart of War crossing the Commission was dated June 6, 1914. The board had a general supervision of the work, the directing of its policy and its finances, which were committed to executive boards of business and agents for execution. The board was presided by the general secretary a sketch of the work described on the reports of the boards of the business houses. The pressure and complexity of the business compelled the board to appoint from the members a directing committee charged with all the responsibilities of the Commission during the intervals between meetings. These committees consisted of Rev. Dr. Wallace, Dr. W. H. Van Rensselaer, Prof. William Gibbs, E. F. Strong, and Prof. R. A. Ayres and C. J. Steele was its permanent staff. It was necessary that this standing committee should be constituted of gentlemen living in New York City, as their meetings were held necessarily daily, and New York thus became their headquarters. For further details see *Moss's History and Work of the Sanitary Commission*.  
Abolished by C. H. AYRES.

**Sanitary Engineering:** See **INDUSTRIAL PLUMBING**, and  
**SEWERAGE**

**San Jacinto:** a river, of Texas, which rises in Waller co. and flows S. E. 120 miles to San Jacinto Bay, an arm of Galveston Bay, a navigable 45 miles. On its banks 2 miles S. W. of the junction of the river and Buffalo bayou, the closing battle of the war of Texan independence was fought Apr. 21, 1836. Gen. Houston, in command of the Texas forces, had been gradually fading back and ward, toward San Jacinto river and bay, before the progress of the Mexicans army under Gen. Antonio Lopez de Santa Anna from the W. The armies were marching on parallel lines, Houston's object being to reach the river and head the force of the mighty Santa Anna to cut off his retreat and capture him. They reached the bay boundary almost simultaneously, and took position within a mile of each other. On the 20th some skirmishing took place, with but little result. On the 21st, with the cry, "Remember the Alamo!" the Texans made a sudden charge, and at the expiration of an hour Santa Anna had fled, and the prob. of his army not shattered in the action had surrendered. The force of the Mexicans was 1,500; that of the Texans about 700. The latter had 6 slain killed and 26 wounded.

**SAN JIL, SANJIL, or SAN GIL**, *Shawl*: a town of the department of Santander, (Colombia), 25 miles S. S. W. of Bucaramanga, in a barren valley, 3,000 feet above the sea. It is the center of an agricultural district comprising cotton, and tobacco, and manufactures flour, etc. Pop. about 10,000.

**San Joaquin (or Joqui)** River, a stream which rises at the foot of a small glacier near the summit of Mt. Lyell, on the eastern border of the Sierra Nevada, California, flows S. W. for nearly 100 miles, then turns N. W. and terminates the magnificent valley of the same name, and at last, joining with the Sacramento, enters Sutter Bay. The discharge to the sea is through the Golden Gate. At high water the outlet of the Pitlake system of lakes is discharged by the San Joaquin, which is very subject to overflow for large distances for a good part of the year. The river is some 500 miles long.

Revised by I. C. Russell.

**San'jo Saneyosh'i**: statesman; b. at Kioto, Japan, in 1836, of an old princely family. He early began to take a prominent position in state matters. His efforts were directed to the restoration of the imperial power, and his co-operation at court was invaluable to Saigo and the other leaders of the malcontents in the provinces. After the restoration in 1868 he became vice-premier, and in July, 1871, premier, a position which he held until 1886, when he became chancellor. D. Feb., 1891. J. M. D.

**San José**, -hō-sā': capital of Costa Rica (since 1823) and of the province of San José; in a valley at the foot of a chain of volcanic mountains; 95 miles by rail from the port of Limon on the Caribbean Sea, and 60 miles by mixed route from Puntarenas (see map of Central America, ref. 8-J). It is the commercial center of the republic, and lies in one of the richest agricultural districts; has a cathedral, national library, university, various Government buildings, and two fine parks. San José is about 4,000 feet above the sea, and consequently has a temperate climate; the water-supply is good, but there is no drainage. Owing to the frequency of earthquakes, all the buildings are low, and the churches are without towers. San José was founded about 1750. Pop. 25,000. H. H. S.

**San José**: city; capital of Santa Clara co., Cal.; on the Southern Pacific Railroad; 8 miles S. E. of San Francisco Bay, 47 miles S. of San Francisco (for location, see map of California, ref. 8-C). It is in the heart of the beautiful Santa Clara valley, and is connected with San Francisco by three lines of railway and a waterway through the bay, and with the Pacific Ocean at Santa Cruz and Monterey by rail. The city is laid out in the form of a parallelogram, with streets ranging from 60 to 100 feet in width. There are four public parks—Washington Square, 28 acres, containing the State Normal School (cost \$200,000); the Plaza, 4 acres, containing the new city-hall (cost \$150,000); St. James's Park, 2 blocks in the center of the city, opposite the court-house and Hall of Records (cost \$500,000); and Alum Rock Park, 7 miles E. of the city, 400 acres, containing numerous mineral springs, and connected with the city by a beautiful boulevard and by railway. The city contains a U. S. Government building that cost \$200,000.

**Churches and Schools.**—San José contains a Roman Catholic Cathedral and 2 other Roman Catholic churches, 7 Methodist Episcopal, 4 Presbyterian, 4 Baptist, 3 Lutheran, 2 Protestant Episcopal, 2 Christian, and one each Congregational, Friends, Jew, Seventh-day Adventist, and Unitarian. There are also a Young Men's Christian Association, Young Men's Institute, Union Chapel, Spiritual Union, Salvation Army barracks, Theosophical Society, Christ's Rescue Mission, and Florence Night Mission. The public-school system comprises a high school, 6 grammar schools, and 6 kindergartens, with an enrollment of 4,000 pupils and an annual cost of maintenance of over \$90,000. The Roman Catholic Church maintains Notre Dame College, St. Joseph's College, Notre Dame Academy, and St. Aloysius's School, and the Methodist Episcopal Church the University of the Pacific, half a mile N. of the city. There are 2 commercial colleges, 4 private schools, a public library, and 4 daily, 9 weekly, and 5 monthly periodicals. The charity institutions include the O'Connor Sanitarium (Roman Catholic), the Pratt Home for Old Ladies, and the Home of Benevolence, maintained by the Ladies' Benevolent Association.

**Finances and Banking.**—The city has annual receipts and expenditures of about \$275,000, net debt of \$300,000, and a property valuation of \$17,800,000. Unassessed realty belonging to the city, parks, reservations, etc., estimated, \$1,000,000. In 1894 there were 6 State banks with combined capital of \$1,590,000, and a national bank with capital of \$500,000.

**Business Interests.**—Lying in the center of a great fruit-growing region, the dominant industry is the preparation and handling of the fruit product. There are three large canneries, one the largest in the world, numerous packing-houses and shipping firms, a large woolen-mill, and an extensive yard for granite-polishing and marble-cutting.

**History.**—The pueblo of San José was established in 1782 by the Spaniards. Under the first constitution of California the State capital was located here. The completion of the overland railway in 1869 greatly promoted the prosperity of the city, and since 1880 its growth has been rapid. Pop. (1880) 12,567; (1890) 18,060; (1894) with suburbs, estimated, 30,000. CHARLES H. ALLEN.

**San José de Cucuta**: See CUCUTA.

**San Juan**, -hōo-an': a western province of the Argentine Republic, between Chili, Rioja, San Luis, and Mendoza. Area, 29,700 sq. miles. A great part of the surface is covered with mountain-chains, parallel to the Andes, and 7,000 to 13,000 feet high. In the west there are arid tablelands, and in the east extensive *travesías* or dry deserts, which could be reclaimed by irrigation. Most of the inhabitants are gathered in the three fertile valleys of Tulán, Jacal, and Fertil. Cattle and sheep are raised and exported to Chili, but agriculture is the principal occupation. There are extensive vineyards, and the wines of San Juan, resembling Malaga, are noted. Until 1864 the province was frequently devastated by civil wars. Pop. (estimated, 1893) about 150,000. San Juan, the capital, on the San Juan river, was founded in 1561, and has a population of about 15,000. On Oct. 27, 1894, it was partly destroyed by an earthquake. HERBERT H. SMITH.

**San Juan Bautista**, -bow-tees'tā: capital of the state of Tabasco, Mexico; on the west or left bank of the river Grijalva, which is navigated by small steamers to this point (see map of Mexico, ref. 8-J). It is built on flat land, has few public or private buildings of any pretension, and is hot and somewhat unhealthful. It controls the trade of the upper Grijalva and portions of Chiapas. Pop. 11,000. H. H. S.

**San Juan de Fuca, Strait of**: the entrance to Puget Sound and the Gulf of Georgia; lies S. of Vancouver's Island and N. of the State of Washington. Its entrance is in lat. 48° 23' 30" N., lon. 124° 43' 48" W.

**San Juan del Norte**: See GREYTOWN.

**San Juan del Río**: a town of the state of Querétaro, Mexico; 28 miles E. S. E. of Querétaro; 6,500 feet above the sea (see map of Mexico, ref. 7-G). It owes its importance principally to rich silver mines in the vicinity. The place is beautifully situated and surrounded by gardens. Pop. about 10,000. H. H. S.

**San Juan del Sur**: a port of Nicaragua; on a bay of the Pacific, where the coast is nearest to Lake Nicaragua (see map of Central America, ref. 7-H). The harbor is good and safe. This was the Pacific terminus of the Central American transit route, now abandoned; it is the only cable-station on the Pacific side, and the commercial port of Southwestern Nicaragua. The proposed interoceanic ship-canal will terminate just N. of this place. H. H. S.

**San Juan de Nicaragua**: See GREYTOWN.

**San Juan de Puerto Rico**: capital and most important city and port of the island of Puerto Rico, Spanish West Indies; on a bay of the northern coast (see map of West Indies, ref. 5-J). The city is built on the western extremity of a low coral island which shelters the bay; the latter forms one of the safest and most commodious harbors in the West Indies, but the entrance is somewhat difficult, requiring a pilot. San Juan was founded by Ponce de Leon in 1511; subsequently it was strongly fortified and repulsed several attacks by English fleets. The most important exports are coffee and sugar. Pop. (1887) 26,387. H. H. S.

**San Juan River**, Nicaragua: See NICARAGUA.

**Sankey**, IRA DAVID: evangelist; b. at Edinburgh, Lawrence co., Pa., Aug. 28, 1840; in business at New Castle, Pa., 1855-70, when he joined Dwight L. Moody in evangelistic work in Chicago, Ill. They labored together in Great Britain 1873-75, and again in 1883. Mr. Sankey is the author of several popular sacred tunes, and has published a compilation entitled *Sacred Songs and Solos*.

**Sāṅkhya** [Sansk. *sāṅkhya*, enumerative (see below), from *sāṅkhyā*, number] the name of the oldest one among the products of Indic speculation that was elaborated into a complete system. For the names of the other five systems, see SANSKRIT LITERATURE. Native tradition makes the Sāṅkhya system older than Buddha (older, say, than 500 B. C.), and maintains that Buddha in the establishment of his doctrines was greatly influenced by it; and this tradition is supported by many correspondences between the two systems. The origin of the rationalistic Sāṅkhya is to be sought in the reaction from the idealistic monism of the Upanishads (see VEDĀNTA), and is to be localized in the same region that brought forth also Buddhism. Originally the system must have maintained an open hostility to the Brahmanical system, as appears indeed from its polemics against Brahmanical ceremonialism. But in the first pre-

things, but also our inner organs—is likened to a dancer that executes a dance before the soul as spectator.

The purpose of the Sāṅkhya is to bring us to understand the absolute difference of the soul from matter; and, especially, even from the finest modifications of matter as exemplified in the inner organs: forasmuch as the intelligent recognition of this difference releases the soul from the bonds of matter and puts an end to the series of rebirths. And hereby is attained that absolute deliverance from sorrow which every wise man is to strive for. All other means for doing away with sorrow—because their effect is only transitory—are worthless. An offshoot of the Sāṅkhya system is the Yoga philosophy. See YOGA. R. GARBE.

Translated by C. R. LANMAN.

**San Laz'zaro:** a small island of the Venetian lagoons, first mentioned in the twelfth century, when a hospital for lepers was established there. After the disappearance of leprosy it was used for other hospital purposes, until the Venetian republic ceded it to Peter Mechitar and his Armenian followers who had fled before the Turks. The Armenian church and convent contain many objects of interest.

**San Leandro**, -lā-aan-drō: town; Alameda co., Cal.; on the S. Pac. Railroad; 9 miles S. E. of Oakland, the county-seat; 15 miles E. of San Francisco (for location, see map of California, ref. 7-C). It is in an agricultural and fruit-growing region, and has manufactories of agricultural implements and hardware, a State bank with capital of \$25,000, and two weekly newspapers. Pop. (1894) estimated, 2,800.

**San Lucar de Barrame'da** (anc. *Ebora*): fortified port and town of Spain, in the province of Cadiz; on the Guadalquivir, near its mouth; 15 miles N. by W. of Cadiz (see map of Spain, ref. 19-C). It exports large quantities of wines and fruit. It is a popular summer resort for sea-bathing. Pop. (1887) 22,667.

**San Lucas, Cape:** See CAPE SAN LUCAS.

**San Luis**, -lōo-ees': an interior province of the Argentine Republic; surrounded by Mendoza, San Juan, La Rioja, Córdoba, and the territory of La Pampa. Area, about 18,000 sq. miles. In the north much of the surface is mountainous; the Salinas desert separates the province from La Rioja. The southern part is a plain included in the Pampas, but partly taken up by arid salines. Owing to the dryness of the climate little of the land is available for agriculture without irrigation, but cattle and sheep are raised in large numbers and exported both to Buenos Ayres and to Chili. The mountain region is rich in gold, silver, copper, graphite, etc. The inhabitants suffered greatly during the civil wars. Pop. (1892) about 100,000. San Luis, the capital, is a town of 8,000 inhabitants, on a plateau 2,502 feet above sea-level; from this point nearly the whole province and the distant Andes can be seen. It is an important station on the railway from Buenos Ayres to Chili. HERBERT H. SMITH.

**San Luis Obis'po:** city (incorporated in 1874); capital of San Luis Obispo co., Cal.; on the Southern Pacific Railroad; 9 miles N. of San Luis Obispo Bay, with which it is connected by railway to Port Harford, and 90 miles N. W. of Santa Barbara (for location, see map of California, ref. 10-D). It is in an agricultural, dairying, and stock-raising region, and contains 5 State banks with combined capital of \$720,000, the Academy of the Immaculate Heart of Mary (Roman Catholic), and a daily and 2 weekly newspapers. Pop. (1880) 2,243; (1890) 2,995. EDITOR OF "TRIBUNE."

**San Luis Potosí:** an interior state of Mexico; bounded by Coahuila, Nuevo Leon, Tamaulipas, Vera Cruz, Hidalgo, Querétaro, Guanajuato, and Zacatecas. Area, 24,446 sq. miles. In the central and northern parts there are extensive high plains included in the Mexican plateau; these are varied by mountains and hills. The eastern and southern portions are on the mountainous border of the table-land, and are exceedingly varied in scenery and climate. Agriculture is the most important industry, the principal crops being maize and wheat on the plateau, sugar-cane, cotton, and coffee in the warm valleys, and maguey, used for the manufacture of pulque and the spirituous liquor called mezcal. The mines (of silver, gold, lead, etc.) are among the most valuable in Mexico; salt is obtained from salines on the plateau. In the western part the grazing industry occupies much of the land. The manufactures are increasing in importance, and altogether this is one of the richest and most progressive of the Mexican states. Pop. (1893) estimated, 550,670; a large proportion are of Indian or mixed race. HERBERT H. SMITH.

**San Luis Potosí:** capital of the state of the same name; in a valley on the mountainous border of the plateau, 6,200 feet above the sea; 362 miles by railway N. N. W. of Mexico (see map of Mexico, ref. 6-G). It is regularly laid out with wide streets and numerous small squares ornamented by trees; the outskirts have so many gardens and trees that, from a distance, only the higher towers can be seen. The cathedral and many churches are richly ornamented. San Luis has a university, school of engineering, mint, etc., with considerable manufactures; it is an important railway center and has a large and increasing trade. The silver mines (discovered in 1583), which first gave importance to the place, are nearly abandoned. The climate is dry and temperate. Pop. (1892) 62,573; this includes numerous suburban villages, the city having about 40,000. HERBERT H. SMITH.

**San Marcos:** town; capital of Hays co., Tex.; on the San Marcos river, and the International and Gt. Northern, and the Mo., Kan. and Tex. railways; 31 miles S. of Austin, the State capital (for location, see map of Texas, ref. 5-H). It is in an agricultural region, and contains 2 national banks with combined capital of \$130,000, Coronal Institute (Methodist Episcopal, South, chartered in 1879), public-school building (erected in 1890, cost \$10,000), a U. S. fish-culture station, grounds of the Texas Chautauqua Association, water-works, electric lights, several steam-ginneries and cottonseed-oil mills, an interesting group of boiling springs, and 3 weekly newspapers. Pop. (1880) 1,232; (1890) 2,335.

ISAAC H. JULIAN, EDITOR OF "PEOPLE'S ERA."

**San Mar'i'no:** the oldest and smallest independent republic in the world, situated in eastern Central Italy (see map of Italy, ref. 4-E). It is governed by a legislative senate of sixty members elected for life, an executive council of twelve, two-thirds of whom go out every year, and two presidents elected for six months. This has been the form of government since 1847, when the constitution was considerably changed. Area, 32 sq. miles, embracing five small villages, with a population of about 8,200. The capital, of the same name, is perched on the crest of a mountain 2,635 feet above the sea. It is said to have been founded early in the fourth century by St. Marinus, a converted stone-mason, who fled from Rimini (12 miles N.) during the Diocletian persecution. Borgo, 500 feet lower down, is the residence of the principal inhabitants. The other three villages are Serravalle, Faetano, and Monte Giardino. There is a standing army of thirty-eight officers and 950 men, and an annual revenue of about 227,000 lire. The principal products are fruit, silkworms, and wine, and there is some good pasture. Gunpowder is manufactured. See histories of the republic by Melchiorre Delfico (Milan, 1804) and Cazeneuve (Paris, 1887).

**San Martin**, saan'maar-teen', José, de: general; b. at Yapeyú, Misiones (now in the Argentine Republic), Feb. 25, 1778. His father was governor of Misiones, but returned in 1785 to Spain, where young San Martin early entered the army as a cadet. He distinguished himself in the wars with France, attaining the rank of lieutenant-colonel. Meanwhile he had adopted republican ideas; in 1811 he resigned and went to London, where he was associated with Miranda and other noted Spanish-American republicans. In 1812 he and other young officers sailed for Buenos Ayres with the object of offering their services to the patriot junta of that colony. On his arrival San Martin was commissioned to organize a regiment of cavalry. This force, the Mounted Grenadiers, was distinguished throughout the war for independence. About Aug., 1812, San Martin and his friends organized the secret society called the Lautaro Lodge; this speedily became the most important political influence in the country, and most of the subsequent successes were directly or indirectly due to it. At the end of 1813 San Martin succeeded Belgrano as commander of the patriot forces in Upper Peru or Bolivia. By the reverses of 1814 the patriots were practically driven out of all the South American colonies except those in the basin of the Plata. The patriots of the Plata basin had repeatedly attempted to attack the central Spanish power in Peru by way of La Paz and Lake Titicaca, but they had always been driven back, the mountain region being unfavorable for cavalry. San Martin conceived the idea of opening a new line of attack by crossing the Andes into Chili; this scheme he was able to carry out through the support of Pueyrredon, director of Buenos Ayres, and the secret influence of the Lautaro Lodge. He drilled and organized his army during two years, and on Jan. 17, 1817, began his march with 4,000 men.

second, the fact that, of all the Indo-European languages, the Sanskrit has, on the whole, best conserved the pristine features of their common parent-speech—a consideration appealing with especial force to most of the cultivated European races, inasmuch as their languages are descended from this parent-speech. The application of the comparative method to the study of genetically related tongues is due in largest measure to the study of Sanskrit, which has thus proved to be the most important factor in the revolutionizing of some parts of classical philology and in the creation of Germanic philology. Moreover, with the broadening of the conception of philology, the conception of comparative philology has also grown broader; instead of being confined to phonology and to the morphology of word and of sentence (comparative grammar), it includes the whole intellectual life of a people, as that life is manifested not only in its language, but also in its literature, its antiquities, its customs and laws, its religion, its philosophy. These subjects when treated comparatively form chapters of comparative philology; and these are the very subjects which receive and are yet to receive especial illumination from ancient India.

The languages of India may be divided primarily into Aryan and non-Aryan (see *Ethnology* under INDIA, and especially DRAVIDIAN LANGUAGES, and Constable's *Hand Atlas of India*, plate 10); the Aryan constitute, with the IRANIAN LANGUAGES (q. v.), the Indo-Iranian group of the Indo-European family of languages. For the relation of this group to the others, see INDO-EUROPEAN LANGUAGES. The Aryan languages of India show three principal stages of development: (1) Old Indic or Sanskrit; (2) Middle Indic or Prākṛit (see PRĀKRIT LANGUAGES); and (3) New Indic or Bhāṣā. The old Indic belongs locally to the Punjab and the Indo-Gangetic plain. The name Sanskrit is applied to the ancient and sacred language of India, the tongue in which the Vedas, Brahmanas, Upanishads, epics, etc., are written. It is difficult to say just how long it was a true vernacular; but, under the influence of learned writers and grammarians, it has maintained for 2,000 years a more or less artificial existence as a means of communication, spoken and written, for the learned of India. The word Sanskrit is a Sanskrit word meaning "elaborate," and it doubtless connotes a certain antithesis to Prākṛit, which means the "ordinary" or "vulgar" (idioms). It is in its broader sense that the term Sanskrit is applied to the language of the widely different periods of Sanskrit literature; in a narrower sense, it is often used as the equivalent of "classical Sanskrit," the language of the later classical works as distinguished from the archaic dialects of the Veda and Brahmanas.

There is, properly speaking, no Sanskrit alphabet. The Hindus of the different parts of India write the language usually each in his own vernacular alphabet. The alphabet which prevails in Hindustan proper is the one called *Nāgarī*, or *Devanāgarī*; and this, of all the Indic alphabets, is the one adopted by Occidental editors of Sanskrit works. It is written from left to right. Alberuni (in his *India*, written about 1030 A. D., chap. xvi.) mentions among the principal alphabets the *Nāgarā* of Malwa. *Nāgarā* means "of the city," and refers perhaps to the very famous city of Ujjain, once the capital of Malwa. The alphabet is probably derived from a Semitic source. By far the most important discussion of this subject is that of G. Bühler, *Indian Studies*, No. 3 (Vienna, 1895).

The system of sounds, in the native order of arrangement, is as follows: Vocalic: *a, ā, i, ī, u, ū, ṛ, ṝ, l, e, ai, o, au*; the breathing *h* and nasalization *ṁ*; consonantal:

| Mutes.   | Surd.    | Surd asp. | Sonant.  | Son. asp. | Nasal.   | Semi-vowels. | Sibilants. |
|----------|----------|-----------|----------|-----------|----------|--------------|------------|
| Guttural | <i>k</i> | <i>kh</i> | <i>g</i> | <i>gh</i> | <i>ṅ</i> | ..           | ..         |
| Palatal  | <i>c</i> | <i>ch</i> | <i>j</i> | <i>jh</i> | <i>ñ</i> | <i>y</i>     | <i>ç</i>   |
| Lingual  | <i>t</i> | <i>th</i> | <i>d</i> | <i>dh</i> | <i>n</i> | <i>r</i>     | <i>ṣ</i>   |
| Dental   | <i>ṭ</i> | <i>ṭh</i> | <i>ḍ</i> | <i>ḍh</i> | <i>ṇ</i> | <i>l</i>     | <i>s</i>   |
| Labial   | <i>p</i> | <i>ph</i> | <i>b</i> | <i>bh</i> | <i>m</i> | <i>v</i>     | ..         |

and the sonant guttural aspirate *h*. The vowels are written with different characters according as they are long or short. The *a, i, and u* vowels are pronounced as in Italian, save that the short *a* has the value of the neutral vowel in *but*. The *ṛ* is like the common English *l*-vowel in *ankle*, and the *r*-vowels are simply untrilled *r*-sounds with vocalic value in syllable-making. Of the mutes, the unspirated surds and sonants and the nasals of the guttural, dental, and labial series are familiar: the surd aspirates *kh, th,*

*ph* are like the simple surd with following breathing, as in *blockhead, pot-hook, uphill*; and the sonant aspirates are rendered in practice as in *abhor*, etc., though their strict value is matter of question. The whole palatal series is secondary, and derived by modification of original gutturals (see PALATALIZATION: pronounce *c* and *j* as in *dolce, jar*). The linguals are pronounced with the tip of the tongue reverted upward to the dome of the palate. A most striking peculiarity is the prevalence of the *a*-sounds, which make up over one-quarter (28 per cent.) of all the sounds of any ordinary piece of text. And since original *e, o, and a* (cf. *ददोषा = dadārṣa*), often also vocalic *n* and *m*, have all been leveled in Sanskrit to one uniform *a*, it is not strange that short *a* aggregates about one-fifth of all Sanskrit sounds. The word-accent is a pitch-accent, not a stress-accent. For the phonetic relations of Sanskrit to the parent-language, see Brugmann's *Comparative Grammar of the Indo-Germanic Languages*.

For the phonetic changes of the language, reference must be made to the grammars. Several general statements may be made, however: hiatus is avoided; when a surd is concurrent with a sonant, either the surd is changed to a sonant or else the sonant to a surd (assimilation, regressive or progressive); consonant groups are abbreviated. The laws of phonetic combination (*samdhī*) wear indeed an artificial aspect in the classical period; yet even there the *rationale* of many or most of them is discernible; and in the Vedas the case is quite otherwise, and the *samdhī* quite simple.

As for morphology, the Sanskrit surpasses, on the whole, all the cognate tongues in transparency of structure, thus contrasting sharply with the Latin, which has been likened, morphologically, to "a venerable ruin." Its words invite analysis and are, for the most part, easily analyzable into roots, suffixes of derivation, and inflectional endings. This feature of the language is exhibited incidentally with wonderful clearness and completeness by Whitney in his *Roots, Verb-forms, and Primary Derivatives of the Sanskrit Language* (Boston, 1885). The Sanskrit roots come nearer in form and meaning to their Indo-European prototypes than do the roots of any other of the related languages. It was this conservation of old material, coupled with its surpassing transparency of structure, that made the study of Sanskrit so fruitful in results and so suggestive of new and rigorous methods to be pursued in etymologizing and in the science of language generally.

In the noun three numbers, singular, dual, and plural, are distinguished; and the dual is actually used probably to a larger extent than in any other Indo-European language. There are the usual three genders, the feminine themes ending prevaillingly in a long vowel. The cases are eight: nominative, accusative, instrumental, dative, ablative, genitive, locative, and vocative; and their proper uses are so precisely like those of the Indo-European case-system that it suffices, in lieu of a general description of them, to refer to INDO-EUROPEAN LANGUAGES. The declension of adjectives is essentially the same as that of substantives. The pronouns are of course of three persons, and except in the first and second persons show three genders. Their inflection is peculiar, but offers striking parallels to the facts of the cognate tongues (with *sa-s, sā, ta-d*, cf. *ṣ, ṣ, ṛ, ṛ, Ang.-Sax. se, seō, dā-t*; with *i-d*, cf. Lat. *i-d*, Eng. *i-d*). The numerals agree well with those of the parent-speech (thus *tri* = three; *nava* = nine). See INDO-EUROPEAN LANGUAGES.

The verb shows, as in Greek, etc., the distinctions of voice, tense, mode, number, and person. The voices are active and middle. In the present system there is a special passive inflection; elsewhere the middle serves also as passive. There are four tense-systems, present, perfect, aorist, and future. The modes are indicative, subjunctive (mostly Vedic), optative, and imperative. There are three numbers and three persons. There are also secondary conjugations, passive, intensive, desiderative, and causative. Most important is the distinction between verbs without the thematic *a*-vowel and verbs with it (*-mu* verbs and *-u* verbs). The retention of ancient accentual conditions is very remarkable, and in general the whole system of conjugation casts floods of light upon innumerable inflectional forms of the related languages.

The syntax is very bald and simple: partly because of the ample number of case-forms for the expression of all the most important logical relations; and partly because, in the case of the verb, although there is an abundant wealth of mode and tense forms, the Hindus never came to turn them to account, as did the Greeks, for the nice expression of modal and temporal relations.

portant. It consists of 1,017 hymns, each containing on an average about ten double lines, so that the text is somewhat less than that of the two Homeric poems together. Its more significant division is into books, hymns, and stanzas (*maṇḍala, śukta, rc*). There are ten books. Of these, books ii.-viii. are called "Family-books," as containing each the hymns ascribed to a single family or clan in which they doubtless originated and by which they were handed down as a sacred inheritance. Thus book iii. contains the hymns of Viśvāmitra and his tribe; book vii., those of Vasishtha; and so on, the names being those of the most famous sages or eponym heroes of Indic antiquity. The hymns of book ix. are addressed to the deified drink Soma. The tenth comprises hymns ascribed to very different authors, while the first consists of fifteen groups, each attributed to some ancient poet-sage. The soma is the juice of a plant believed to be of the milkweed family, and now classed as *Sarcostemma brevistigma*; and the Soma sacrifice appears to have been an exceedingly important feature of the Vedic religion. Certain principles of arrangement within the books are discernible: thus in books ii.-vii. the hymns to the fire-god Agni (*agnis*) come first; then those to Indra, the Jupiter Pluvius; and so on. The oldest hymns may have originated as early as 1200 or 1500 B. C., but it is not feasible to assign a precise date. Geographically, the early Vedic Aryans may be referred to the land of the Punjab and Indus. Their religion is a worship of the anthropomorphized forces of nature, and is in many ways most instructively primitive. The best works on this subject are E. W. Hopkins's *The Religions of India* (Boston, 1895) and H. Oldenberg's *Die Religion des Veda* (Berlin, 1894).

The Brāhmanas of the Rigveda are the *Āitareya* and the *Çāṅkhāyana* or *Kāusītaki*; and each of these is supplemented by an Aranyaka of similar designation; and part of each Aranyaka forms an Upanishad (translated, *Sacred Books*, vol. i.). To this Veda further belong Aṅvalāyana's *Çrāuta-sūtra* and *Çāṅkhāyana's Çrāuta-sūtra*, both edited in the *Bibliotheca Indica* (Calcutta); and also Aṅvalāyana's *Grhya-sūtra* and *Çāṅkhāyana's Grhya-sūtra*, edited and translated, the first by A. F. Stenzler, and the second by H. Oldenberg.

5. *The Sāmaveda* is a Veda of *sāman*. A *Sāman* is properly a tune, not a text; but the word *sāman* came to be used of the text to which a given tune was sung, a stanza of the Rigveda modified for chanting. Of the 1,549 stanzas of the Sāmaveda (edited and translated by T. Benfey, Leipzig, 1848), 1,474 occur also in the Rigveda.

6. *The Black Yajurveda* belongs to the period of the highly developed ritual. At least five schools of the older Yajurveda possessed special Sanhitās, of which four are extant. Of these, the *Taittirīya* has been published by A. Weber (Berlin, 1872) and the *Maitrāyaṇīya*, by I. von Schröder (Leipzig, 1881-86). In all these older texts sacred formulas are confusedly mingled with prose passages. To remedy this confusion a new school, called Vājasaneyins, arranged a Sanhitā of "clear formulas," that is of formulas clear of Brāhmana passages. The word for "clear" (*śukla*) means also "bright" or "white"; and it is perhaps with reference to this double meaning that the older Yajus texts were called "Dark" or "Black." The Brāhmana of the White Yajurveda or *Vājasaneyi-Samhitā* is the *Çatapatha*, much of which has been Englished by J. Eggeling, *Sacred Books*, vols. xii., xxvi., and xli. *Samhitā, Brāhmana, and Çrāuta-sūtra* (Kātyāyana's) have all been published by A. Weber (Berlin, 1852-59).

7. *The Atharvaveda* Sanhitā, as compared with that of the *Rigveda*, represents a lower plane of life and thought. It contains magic incantations for the warding off of the most diverse malign influences, and prayers and charms for success in the various affairs of life, as love, gaming, quarrels, journeys, etc. The text was published by Roth and Whitney (Berlin, 1856), and Whitney has left the manuscript of a translation, in course of publication (1895) in Lanman's *Harvard Oriental Series*.

8. *Vedic Bibliography*.—The first complete edition of the *Rigveda* was issued by T. Aufrecht in Roman letters (Berlin, 1861-63; 2d ed. Bonn, 1877). Max Müller's great six-volumed quarto edition, in Nāgarī letters, with native commentary, etc., was begun in 1849 and completed in 1874 (London). A new edition of this in four volumes quarto was issued in 1892 (London). Octavo editions, also in Nāgarī, were issued by Müller in 1873 and 1877. The greatest achievements in Vedic exegesis are those made by Roth, and contained chiefly in the St. Petersburg lexicon. H. Grass-

mann has published a *Wörterbuch zum Rigveda* (Leipzig, 1875), and a complete translation (Leipzig, 1877). For a succinct sketch of the Vedic literature, with numerous references to other sources of information, see A. Kægi's *Rigveda* (Englished by R. Arrowsmith, Boston, 1886), notes 1-26, or Lanman's *Sanskrit Reader*, pp. 352-59.

B. THE CLASSICAL PERIOD. 1. *Epos*.—The most important works of this period are the great epics. These are treated separately. See MAHĀ-BHĀRATA and RĀMĀYANA.

2. *The Purāṇas*.—These are pseudo-historical works, often in prophetic tone, and in metrical form. Their name means "old," but the extant Purāṇas are held to be not over a thousand years old. The *Bhāgavata-Purāṇa*—or most of it—was published and translated by E. Burnouf (Paris, 1847). Of the *Viṣṇu-Purāṇa*, H. H. Wilson gave an analysis and translation (2d ed., enriched with notes, by Fitzedward Hall, 6 vols., London, 1864-77). Of this and other Purāṇas, as the *Agni-Purāṇa*, the *Mārkaṇḍeya-Purāṇa*, there are cheap Hindu editions. The *Viṣṇu* treats of the evolution and dissolution of the universe, of the *yugas* or ages, of mythical geography, the heavenly bodies, and the origin of the castes; gives many ancient legends, accounts of the Vedic literature, the dynasties of kings, the history of the god Krishna, etc. The Purāṇas are in fact a kind of encyclopædic digest of Indic knowledge, but in many ways quite untrustworthy.

3. *The Artificial Epics*.—These are called *Kāvya*, and the oldest are referred to the fifth or sixth century of our era. They take their material from the great popular epics, but can never themselves have been popular, since only the learned could understand them. In them the epic element gives place more or less to the lyric and descriptive, and they are often not without real poetic merit and genuine feeling. There are six of them that the Hindus call "great Kāvya"; and among the six the most noted are the *Raghuvansa*, or "The Ancestry and Deeds of Rāma," and the *Kumāra-sambhava*, or "Birth of the War-god," both ascribed to the famous Kālidāsa, and both edited and translated by A. F. Stenzler, the latter translated also by R. T. H. Griffith into English verse. See especially the masterly fifth canto.

4. *The Drama*.—The real beginnings of the drama may be seen in the *Rigveda*, where there are not a few hymns in the form of genuine dramatic dialogue. In the *Mahābhārata*, too, are passages of similar character. And the public recitations of the epics were in fact really dramatic performances. The earliest direct allusion to this subject is made by Pāṇini, probably in the fourth century B. C., who speaks of "rules for actors" (*nāṭa-sūtras*). The word *nāṭa*, with many derivatives, including *nāṭya*, Anglo-Indian *nauteh*, and *nāṭaka*, "drama," comes from the root *naṭ* or *nṛ*, "to dance," and perhaps warrants the inference that the Hindu drama originated in pantomime. From the statement of Patanjali (about 143 B. C.), who mentions the slaying of Kansa by Krishna as a subject of dramatic representation, it would seem that the oldest performances were of a kind like to the mediæval mysteries. There has been much debate (A. Weber, E. Windisch) as to whether the Greek drama influenced that of the Hindus. The question is unsettled. The Hindu play is divided into acts, with benediction in place of a prologue, with prelude and with interacts; and it is peculiar in that the women and inferior characters speak not Sanskrit but Prākṛit. The dialogue is in prose, with lyrics interspersed. Lévi enumerates the titles of some 375 dramatic works; of the extant dramas hardly more than fifty are of considerable literary value.

The *Mṛcchakaṭikā*, or "Earthen Toy-cart," is held to be the oldest. It is ascribed to King Çūdraka, and the scene is laid at Ujjain. It is a love-story with political underplot. The Sanskrit work most famous as literature is the *Çakuntalā* of Kālidāsa (about 550 A. D.). For this and his dramas *Vikramorvaç* and *Mālarikā*, see KĀLIDĀSA. To Çri Harshadeva—apparently the King of Kanauj at the time of HÜEN-TSANG (q. v.), about 630 A. D.—are ascribed the *Ratnāvalī* and the *Nāgānanda*. Bhavabhūti is said to have flourished at this same court of Kanauj about 700 A. D. He was author of the *Mahāvīra-carita*, or "Life of the Great Hero," and *Uttara-rāma-carita*, or "Later Life of Rāma," which together form a dramatized version of the Rāmāyana, and of the *Mālatī-mādhava*, a domestic drama. These are held in high esteem by the Hindus, but Bhavabhūti, as compared with Kālidāsa, is more artificial, more under bondage to the rules of the writers on dramatic composition. Bhaṭṭa Nārāyaṇa's *Veṇī-samhāra*, or "The Seizing of the

to him as emperor; but later he went over to the republicans, and by heading a revolt at Vera Cruz Dec. 2, 1822, was the chief instrument of Iturbide's downfall. During the presidency of Guadalupe Victoria, 1824-28, Santa Anna lived in retirement; but the political struggles of 1828 brought him again into prominence. By a pronunciamento in favor of Guerrero he materially aided him to attain the presidency, and was rewarded by high commands in the army. In 1829 he was sent against the Spanish army, which had invaded Mexico under Gen. Barradas; the latter was forced to capitulate at Tampico Sept. 11, and this success added immensely to Santa Anna's popularity. In 1832 he headed the revolt by which Bustamante was overthrown and Gomez Pedraza, the constitutional president, was restored for the remainder of his term. Santa Anna himself became a presidential candidate, and was elected for the term beginning Apr. 1, 1833. He assumed the executive only at intervals and for short periods. At first the chair was occupied by Vice-President Gomez Farias, an enlightened statesman who instituted many reforms. These excited violent opposition in the Church and army, secretly fomented by Santa Anna, who, whenever he acted as president, posed as the champion of religion and order. By such intrigues he obtained the support of the reactionists, had Farias banished in 1835, abolished the federal constitution, and became practically dictator, though commonly acting through vice-presidents who were his subservient tools. Texas seceded in 1836. Santa Anna marched against the rebels, stormed the Alamo, and massacred its garrison Mar. 6, 1836, but was defeated and captured by Houston at the battle of San Jacinto Apr. 21-22. To obtain his release he recognized the independence of Texas in a treaty which was repudiated at Mexico; all his popularity was lost, and when he returned to Jalapa he signified his intention of retiring to private life. The French invasion of Vera Cruz in 1838 brought him out again; he was given command of the army, defeated the French Dec. 5, and, having lost a leg in the engagement, became at once a popular hero and martyr. In 1839 he supported Bustamante against the federalist revolts, and was for a short time acting president. In 1841, partly by intrigue and partly by open rebellion, he deposed Bustamante and caused himself to be chosen president with dictatorial powers, increased by the new constitution of June 12, 1843. This led to fresh revolts. In Dec., 1844, his opponents seized the capital during his absence; he was defeated, captured, and banished, taking up his residence in Havana. Fresh changes brought his party again into power; he was recalled in 1846, and in December of that year was again elected president, but, as usual, only assumed the executive at intervals. During the war with the U. S. he commanded the Mexican army, and was repeatedly defeated by Taylor and Scott (see TAYLOR, ZACHARY, and SCOTT, WINFIELD); after the capture of Mexico he resigned and left the country. In 1853 he was recalled by a conservative revolution, was made acting president, and on Dec. 16, 1853, declared himself perpetual dictator, with the title of supreme highness. But the liberals, under Alvarez and Comonfort, speedily excited a civil war. After a vain attempt at conciliation Santa Anna fled from the capital Aug. 9, 1855, and soon left the country. In his absence he was tried and condemned for treason and his estates were confiscated. He was never again prominent in Mexican affairs, though he kept up a series of intrigues in the U. S. and elsewhere, and vainly offered his services to the French invaders and to Maximilian. In 1867 he made an attempt to enter the country, but was captured and exiled. After the amnesty of 1874 he returned, but lived in obscurity. D. at Mexico, June 20, 1876. HERBERT H. SMITH.

**Santa Barbara:** city; capital of Santa Barbara co., Cal.; on Santa Barbara channel, and the S. Pac. Railroad; 14 miles E. of Elwood (for location, see map of California, ref. 11-D). There is regular steamer communication with San Francisco, San Diego, and San Pedro. Santa Barbara is in a sheltered nook of the shore, is protected on the N. by the Santa Ynez Mountains, and from its dry, equable climate has become one of the most noted midwinter health resorts on the Pacific coast. The temperature ranges from 50° to 55° in winter, and from 65° to 70° in summer. The city has beautiful surroundings, with luxuriant roses and tropical plants, many attractive residences, a Spanish and a Chinese quarter, and an excellent bathing-beach. There are a public high school, primary and grammar schools, St. Vincent's School, manual-training school, free kindergarten, collegiate school, commer-

cial college, College Hospital, 2 national banks with combined capital of \$200,000, 2 State banks with capital of \$60,000, 3 libraries (Public, Franciscan Mission, and Natural History), and 2 daily and 3 weekly newspapers. The Spanish Mission, founded by Junipero Serra in 1786, is within a mile of the city; it includes a church with two towers, a refectory, a dormitory, and a garden, and is still in charge of Franciscan monks. Other points of interest are the springs containing sulphur, sulphuretted hydrogen, iron, alumina, and potash; the Parra Grande, or great grapevine, which annually yields about 8,000 lb. of fruit, at Montecito, 4 miles distant; and numerous avenues of magnolias, bananas, and date-palms, fields of pampas grass, groves of walnut, orange, prune, olive and loquat trees, and interesting Chinese vegetable gardens. The city is in an agricultural and stock-raising region, and has large wool, olive oil, asphaltum, petroleum oil, and fruit-growing interests. It has received the popular name of the American Mentone. The harbor was first visited by Sebastian Vizcaino in 1603. The presidio established by Gov. Felipe Neve in 1782 was maintained till the arrival of Gen. Fremont. Pop. (1880) 3,460; (1890) 5,864.

G. E. THURMOND.

**Santa Catharina:** an island of the state of Santa Catharina. It is 34 miles long by 3 to 5 miles wide, and is separated from the mainland by a channel which forms an excellent harbor. The surface is partly hilly. On the western side is the capital of the state, sometimes called Santa Catharina, but properly DESTERRO (q. v.). H. H. S.

**Santa Catharina:** a maritime state of Brazil, bounded by Paraná, the Atlantic, Rio Grande do Sul, and the Argentine Republic. Area, 28,627 sq. miles. A low coast belt lies between the ocean and the Coast Range, which here rises to 5,000 or in parts to 6,500 feet. This range is succeeded by an irregular plateau which falls gradually westward. The coast belt and mountains are covered with forest, araucaria predominating above 3,000 feet. The plateau is occupied in part by open grass-lands, in part, especially toward the W., by tracts of forest. The principal rivers are the Pelotas or upper Uruguay, on the southern boundary; the Iguassú, a branch of the Paraná, on the northern boundary; and the Itajahy, flowing to the Atlantic. The climate is essentially tropical on the coast, temperate on the plateau. Santa Catharina, though it has a fertile soil and other natural advantages, has developed very slowly. Agriculture and grazing are almost the only occupations. There are considerable agricultural colonies of German and Italian immigrants. A little coal is mined. Pop. (1888) estimated, 236,346. H. H. S.

**Santa Clara:** town (founded in 1852, received new charter in 1867); Santa Clara co., Cal.; on the S. Pac. Railroad; 3 miles W. by N. of San José, and 48 miles S. E. of San Francisco (for location, see map of California, ref. 8-C). It is in the center of the beautiful and rich agricultural valley from which the town takes its name, and contains a State bank with capital of \$125,000, a public high school, Santa Clara College (Roman Catholic, opened in 1851), Academy of Our Lady of Angels (Roman Catholic), convent school, a library, and two newspapers. The University of the Pacific (Methodist Episcopal, opened in 1852) is about midway between Santa Clara and San José. Pop. (1880) 2,416; (1890) 2,891; (1895) estimated, 3,000. EDITOR OF "JOURNAL."

**Santa Cruz, or St. Croix:** an island of the Danish West Indies; in the Virgin islands group; 37 miles S. of St. Thomas. Area, 83 sq. miles. The surface is hilly, with considerable plains near the coast; the soil is fertile and well watered. Sugar and rum (known as Santa Cruz rum) are the principal products and exports. The common language is English. Santa Cruz was discovered by Columbus in 1493, was occupied in turn by Spanish, English, and French adventurers, and was sold by the French to a Danish company in 1733. Chief town, CHRISTIANSTED (q. v.). H. H. S.

**Santa Cruz:** a territory of the Argentine Republic; occupying the southern part of Patagonia S. of lat. 46° S., and bounded S. and W. by Chili. Area, 111,000 sq. miles. The greater part is a terraced plateau, which, especially near the Andes, contains good pasture-land. Some of this has been taken up by sheep-farmers, but the civilized population does not exceed 2,000. There are a few roving Indians, who sell guanaco-skins to the traders. Capital, Gallegos. The Santa Cruz river, from which the territory takes its name, has its sources in several beautiful lakes on the western slope of the Andes; it is navigable for small craft, and its estuary forms the port of Santa Cruz. H. H. S.

The cathedral of San Francisco, of light brownstone, is built around a former cathedral whose history dates back to 1622. The educational institutions comprise 3 public schools, the University of New Mexico (Congregational, opened 1880), St. Michael's College (Roman Catholic, opened 1859), the Presbyterian Academy (opened 1881), Academy of Our Lady of Light (Roman Catholic), Whitin Hall School (Congregational), the Ramona Industrial School for Indian girls (memorial to Helen Hunt Jackson), and a Roman Catholic school for Indian boys.

**History.**—As far back as 1541 the place existed as an Indian pueblo or town, with a population estimated at upward of 15,000. About 1605 it was occupied by the Spaniards, who gradually reduced the Indians to slavery and opened and worked the rich mines of gold and silver. In 1680 the Indians revolted, expelled the Spaniards, closed up and obliterated all traces of the mines, and burned all the Spanish archives and church ornaments. The Spaniards under Vargas recaptured the pueblo in 1692, and the territory was held by Spain till 1821, when Mexico declared and perfected its independence. In 1846 U. S. troops under Gen. S. W. Kearny took possession of the city; in 1848 the territory was ceded to the U. S.; and in 1851 Congress created the Territory of New Mexico, with Santa Fé as its capital. Pop. (1880) 6,635; (1890) 6,185. G. J. HAGAR.

**Santa Fé de Bogotá:** See BOGOTÁ.

**Santalacées:** See SANDALWORTS.

**Sant-Aldegonde:** See MARNIX, PHILIPP, van.

**Santal-wood, Sanders, or Saunders:** the heart-wood of a tree, *Pterocarpus santalinus*, found in the East Indies, Ceylon, and Madagascar, and on the coasts of Coromandel and Malabar. It occurs in large billets, compact, hard, and of a dull murky red. Its coloring-matter is supposed to be similar to, if not identical with, that of barwood. It is only developed by age, and, while it is abundant in the trunks, is not found in the young branches. Weidel isolated two peculiar bodies from santal-wood: (1) *Santal* ( $2C_9H_9O_2 \cdot 3H_2O$ ), colorless crystals, tasteless, odorless, insoluble in water, bisulphide of carbon, benzene, and chloroform, and slightly soluble in alcohol and ether. Its alkaline solution is yellow, but becomes rapidly red in the air, and gives red precipitates with lime and baryta. Its alcoholic solution assumes a dark red with ferric chloride. He obtained 3 parts from 1,000 of wood. (2) *Santaline* ( $C_{11}H_{14}O_4$ ), which is a magnificent scarlet, with a green metallic iridescence, is insoluble in water, slightly soluble in alcohol and ether, and imparts a reddish purple to alkaline solutions. Santal-wood is used chiefly on the Continent to give a bottom to woolen cloth to be subsequently dyed with indigo, yielding by this combination a fine blue (*bleu de Nemours*), which is purple blue by reflected light. It also imparts a dark red to woolen and cotton goods, which assumes a rich brown on passing through a bath of bichromate of potash; with sumac it gives a dark brown, with fustic a light brown. Revised by IRA REMSEN.

**Santa Maria:** a name for PUERTO DE SANTA MARIA (q. v.).

**Santa Maria:** town (settled in 1874); Santa Barbara co., Cal.; on the Santa Maria river, and the Pacific Coast Railway; 13 miles from the ocean, 31 miles S. of San Luis Obispo (for location, see map of California, ref. 10-D). It is in an agricultural, fruit-growing, and stock-raising region, and contains 4 churches, 3 public-school buildings (high school cost \$15,000), 4 hotels, State bank with capital of \$25,000, and 2 weekly newspapers. Pop. (1880) 300; (1890) 900; (1895) estimated, 1,500. EDITOR OF "SANTA MARIA TIMES."

**Santa Maria, Domingo:** statesman; b. at Santiago, Chili, Aug. 4, 1825. He graduated at the University of Santiago; was admitted to the bar in 1847; held minor Government offices, and early became known as a pronounced liberal. Being involved in the insurrection of 1851-52, he was banished for a year to Peru; was elected to congress on his return, and became widely known for his brilliant oratory; and during the political struggles of 1858-59 was again banished, traveling in Europe. President Perez recalled him, and made him Minister of Finance 1863-64. During the war with Spain he negotiated a treaty of alliance with Peru. In 1868 he was appointed judge of the Supreme Court. He supported the administration of President Pinto, was his Minister of Foreign Affairs and of the Interior, and finally Minister of War during the second year of the contest with Bolivia and Peru. His vigorous measures won him great popularity, and he was elected to succeed Pinto Sept. 18, 1881-Sept. 18, 1886. The war was brought to a successful

end in 1888, and in the same year the Araucanian Indians were finally subdued. Subsequently he was president of the senate. D. at Santiago, 1890. H. H. S.

**Santa Maria di Capua:** See CAPUA.

**Santa Marta:** capital and port of the department of Magdalena, Colombia; on a bay of the northern coast; 40 miles E. N. E. of the mouths of the Magdalena (see map of South America, ref. 1-B). It was founded by Rodrigo de Bastidas in 1525, as the capital of the province of the same name, which corresponded in part to the modern department. During the colonial period it was very important as a port and center of conquest; Quesada, marching from this place, conquered the plateau of Bogotá. The town was repeatedly attacked by Indians, and taken and sacked by English and French corsairs; the ruins of the Spanish forts erected for its defense may still be seen. The harbor is one of the best on the coast; a short railway runs to Ciénega, and (1895) projected to Cerro de San Antonio on the Magdalena. Santa Marta is an episcopal see, and has a cathedral, seminary, hospital, etc. Pop. about 6,000. HERBERT H. SMITH.

**Santa Marta, Sierra Nevada de:** an isolated group of mountains in Northern Colombia (department of Magdalena), near the coast, and immediately S. E. of the town of Santa Marta. Brettes and Nufiez, who first scaled the highest peak in 1891, found it to be 17,018 feet above sea-level; other estimates make it higher. From the sea the snow-crowned summits present a magnificent sight. The group is completely separated from the Andean system, and has a different geological structure. H. H. S.

**Santa Maura, saan'taa-mow'raa, or Leuca'dia:** one of the Ionian islands; formerly a peninsula, but since the seventh century B. C. separated from Western Greece by a strait about a mile wide. Area, 180 sq. miles. Pop. 25,000. Its history has been mainly that of the other IONIAN ISLANDS (q. v.). Hills traverse it from north to south, terminating in white cliffs, whence its ancient name *Leucas* (Gr. *leukos*, white). One of these cliffs served as a place of execution of criminals. This is still called Rock of Sappho's Leap, from the tradition that the poetess and other unhappy lovers cast themselves hence into the sea. E. A. G.

**Santa Monica:** city; Los Angeles co., Cal.; on the Pacific Ocean, and the S. Cal. and S. Pac. railways; 17 miles W. of Los Angeles, the county-seat (for location, see map of California, ref. 12-F). It is a popular summer resort, is engaged in ostrich-farming, lumbering, and milling, and contains one of the longest ocean wharves in the world (extending 4,700 feet into Santa Monica Bay), 7 churches, graded grammar and high school, public library, water-works, electric lights, 2 State banks with combined capital of \$115,000, and a weekly newspaper. The Pacific branch of the National Home for Disabled Volunteer Soldiers is here. Pop. (1880) 417; (1890) 1,580. EDITOR OF "OUTLOOK."

**Santa'na, Pedro:** general and politician; b. at Hincha, Santo Domingo, June 29, 1801. He was a lawyer and wealthy landowner until 1844, when he headed the revolution by which the eastern part of the island became independent of Haiti; was president of the Dominican Republic, then formed, 1844-48; repulsed the invasion of Soulouque 1849; deposed Jimenes, and was president for a short time; was president by regular election 1853-57, and again defeated Soulouque in 1855 and 1856. After the deposition of Baez, Nov., 1858, Santana again assumed the presidency, but despairing of bringing about order, he ceded the republic to Spain in Mar., 1861. He was appointed lieutenant-general in the Spanish army, and quelled an insurrection in Azua. D. at Santo Domingo, June 14, 1864. H. H. S.

**Santander:** capital of the province of Santander, Spain, on a promontory in an inlet of the Bay of Biscay, where a spacious and perfectly safe harbor is formed by two mountains, and provided with convenient quays and docks (see map of Spain, ref. 12-F). The surrounding hills are beautifully covered with vineyards and forests, and rich in mineral springs and iron and copper ores. The rivers and the sea teem with fine fish. There are several good manufacturing establishments. Wheat and ores are the principal exports. Pop. (1887) 41,829.

**Santander:** an interior department of Colombia, on the east side of the river Magdalena; surrounded by Magdalena, Venezuela, Boyacá, Antioquia, and Bolívar. Area, 16,291 sq. miles. It is traversed by the Eastern Cordillera of the Andes, and two-thirds of the surface is essentially mountainous. Near the Magdalena and in the eastern part there are extensive plains. The river Sogamoso divides the

Santería, region by a deep gorge, flowing to the Magdalena. The drainage of the northern part is to Lake Maracaibo. The soil, climate, and natural productions embrace almost everything found in Colombia, but the roads are almost none, and the difficulty of communication has retarded the development of the department. The principal occupations are agriculture, the most important crops being coffee, sugar, and tobacco. Gold, silver, emeralds, etc., are found in a small way. There is a considerable trade with Venezuela. Pop. (1905) estimated, 300,000. Capital, SANTANDER.

HENRY H. SMITH.

**Santander, Manuel de Paula:** General and statesman; born in Colombia, San Andrés, Apr. 2, 1782. He was graduated at Bogotá when the war for independence broke out, joined the patriots and served through the subsequent campaigns, was with Bolívar in the famous march across the Andes, and in the invasion of Venezuela, and by his opportune march with the main force secured through to gain the victory of Boyacá. Bolívar afterwards was promoted general of division on which he was appointed vice-president, or secretary, of Cúcuta. He was elected on Sept. 7, 1801, was elected vice-president in 1802 and in 1803. During the latter's campaign in Venezuela and Peru, 1805-7, he governed the republic with wisdom and energy, completely stamped it of hostile foreign influence, and the recognition of foreign power, and he was elected president in 1807. After Bolívar's return in 1808 he led the federalist opposition to him, and when Bolívar again assumed power in 1809 Santander was deposed. Soon he was arrested and committed to death on a charge of treason, but, after an attempt to assassinate Bolívar, the sentence was commuted to banishment and he went to Europe. In 1814, after the dissolution of the republic of Colombia, Santander's honors were restored and he was invited to return. Before his arrival he was elected president of New Granada Mar. 9, 1812, and during the first part of the beginning of 1817. Subsequently he was elected member of congress. In 1818, May 1809, Santander was one of the ablest statesmen of his country and was generally regarded as the founder of New Granada, the modern Colombia. H. H. S.

**Santa Paula:** town in Ventura co., Cal.; on the coast, about 16 miles S. E. of San Buenaventura, the harbor, and the river N. W. of Los Angeles (for location, see map of California, ref. 14 by). It is the center of a rich agricultural region, the place of residence of many of the best farmers in the Santa Clara valley, and a noted health resort. The valley is surrounded by mountains producing an excellent water, petroleum, asphaltum, and numerous other minerals and timber. It has the largest tract of the country (yielding an average of a ton per acre), the orange and lemon groves, and a great honey industry. The town contains 11 churches, a public school building, a court house with capital of \$75,000, and 2 weekly newspapers. The principal industries are the refining of sugar, and the manufacture from it of over fifty articles, the manufacture of printing-inks, the manufacture of building stone, and asphaltum, and the drying of fruit and sugar. Pop. (1890) 1884; (1900) 1317; (1910) 2000.

EDWIN C. "CINCINNATI."

**Santafé de Bogotá:** a town of the state of Pará, Brazil, on the river Papayá, 3 miles above its junction with the Amazon; see map of South America, ref. 3-Fa. It has been the chief river port between Manaus and Pará; the center of an agricultural and grazing district; and one of the chief cities of the Papayá. Near it is an important sugar estate composed of immigrants from Brazil, but it is S. Pop. about 2,000. H. H. S.

**Sant'Anna, Miguel Francisco de Barros e Sousa, Viscount of Sant'Anna and Indragua:** b. at Lisbon, Portugal, in 1752. The father was a courtier. He accompanied his father to Brazil in 1787, held diplomatic positions in Rio de Janeiro, and was minister of Portugal to Denmark, 1805-10. From 1811 to 1827 he was director of the treasury of Portugal. During the regency and then Miguel was minister of State in 1824. After the fall of Miguel he went to Paris where the remainder of his life was spent. He was a French and Portuguese and was rather famous as a historical novelist than well-informed historian, and was somewhat notable. Among them are *Revolução do Brasil* (1842); *Essai sur l'histoire*

*de la cartographie et de la cartographie pendant le moyen âge* (1842-52); continued by Mendes Leão; and *Ampliação elementar das coleções publicações diplomáticas do Brasil* (1842-52), by Sant'Anna; continued by Roberto de Silva; b. in Paris, Jan. 14, 1850. H. H. S.

**Santa Rita Durão, Antônio de Almeida, José, do; post. b. near Mariana, Minas Gerais, Brazil, 1767. He studied in Rio de Janeiro and at Coimbra, and became Doctor of Theology at the University of Coimbra, Dec. 21, 1796. After a journey to Rome, where he made the acquaintance of his compatriot, Basilio da Gama, and felt powerfully the influence of the Italian poets, he became professor at Coimbra before 1798. Here he pronounced an elegant and truly interesting Latin oration (*Josephus Durão, Theologiae professoris O. E. S. A. pro oratione studiorum institutionum universitatis Coimbræ*, 1778). He was also professor of *theologiae* (Lisbon, 1793), an account of the discovery and settlement of Brazil, by Paulo Arinos (called *Coronatio* by the editor); The poem has been several times printed, but the best edition is in Varragena, *Epicae brasiliensis libellus*, 1845. b. in Lisbon, Jan. 34, 1784. A. H. Mason.**

**Santa Rosa:** city located in 1854; capital of Sonoma co., Cal.; on the San Francisco and N. Pac. and the S. Pac. railways; 61 miles N. of San Francisco (for location, see map of California, ref. 6 by). It is widely known for its roses, which bloom all the year in the open air, and is the center of a region peculiarly adapted to fruit-growing, hop and grain growing, hay-making, and dairying. The city is laid out on a site nearly level, with wide streets and broad sidewalks bordered with trees. There are nine churches; one, the Baptist, was built out of a single tree, a great redwood from the timber mill forest. The educational institutions comprise the public schools with 1,500 pupils, the Santa Rosa Seminary and the Ursuline Academy (Roman Catholic), the Santa Rosa Ladies' College (Methodist), and the Pacific Methodist College (Methodist Episcopal South, opened in 1901). The town-house is an imposing structure, and, with adjacent county buildings, cost \$200,000. The city has an excellent gravity water-supply, gas-works, two electric-light plants, several flourmills, and extensive fruit-drying and canning works. There are a national bank with capital of \$150,000, 3 State banks with combined capital of \$600,000, and 2 daily and 4 weekly newspapers. In 1904 the city had receipts of \$40,418 and an assessed property valuation of \$3,222,000. Pop. (1890) 3,610; (1900) 5,201; (1910) 7,250. JAMES W. CARTER.

**Santa Rosa de los Ocos:** a town of the department of Antioquia, Colombia; 26 miles N. E. of Medellín; on a plateau of the Andes; 4,500 feet above sea-level. It owes its importance to rich gold-deposits in the vicinity; there are over forty regular works, but the methods of working are antiquated. The climate is cold for Colombia (winter, 67° F. and very cold). Pop. (1890) 10,000. H. H. S.

**Santa Rosalia:** city of Southern Chihuahua, Mexico; on the Mexican Central Railway; 325 miles S. of El Paso (see map of Mexico, ref. 3 E). It is celebrated for its hot sulphur springs, long known to be curative by the natives and much resorted to by invalids. They are especially useful in inflammatory rheumatism. Pop. estimated at 5,000. M. W. H.

**Santa Tecla, or Nueva (now called) San Salvador:** a town of El Salvador; 4 miles S. W. of San Salvador, beautifully situated in a valley on the south side of the San Salvador volcano. After the destruction of San Salvador by the earthquake of 1854 an attempt was made to remove the population to this place, which was officially declared to be the capital in 1855. The latter arrangement was never carried out, but the newly founded city has prospered. Pop. (1890) 19,715. H. H. S.

**Santee Indians:** See SIOUX INDIANS.

**Santee River:** a stream formed in South Carolina by the union of Wateree and Congaree rivers. It is 150 miles long and is navigable throughout for steamboats. Its lower course is through pine-forests and low rice-lands. It reaches the Atlantic through the North and the South Santee.

**Sauterre, saint-far, Antoine Joseph:** revolutionist; b. in Paris, Mar. 16, 1782; was a broker by trade, and acquired influence by his wealth and generosity. His treasury in the Faubourg Saint-Antoine became a frequent meeting place for the Jacobins. As commander of a battalion of the national guard, he took part in the storming of the Bastille July 14, 1789, and played a conspicuous part in the riots of the Champ de Mars, the attack on the Tuilleries (June 20,

1792), and the insurrection of Aug. 10. He was appointed commander-in-chief of the national guard of Paris, with the rank of general of division, and governor of the Temple during the imprisonment of the king, whom he escorted to the scaffold. In the summer of 1793 he was made a general of division and sent to the Vendée at the head of an army of 20,000 men, but was beaten at Coron Sept. 18, 1793; recalled and arrested as an Orleanist, he did not regain his liberty till after the fall of Robespierre. After this he withdrew into private life. D. Feb. 6, 1809. See Carro, *Sant-erre, sa vie politique et privée* (Paris, 1847).

**Santi**, saan'tē, GIOVANNI: painter; father of Raphael Sanzio; b. at Castello di Colbordolo, in the duchy of Urbino, Italy, about the middle of the fifteenth century. His master in painting is unknown, but he seems to have formed his style from that of Melozzo da Forlì and other great painters of his time. Giovanni Santi's best-known work is the fresco in the Dominican church at Cagli (1482). There is a *Visitation* at Fano, and a *Madonna with Saints* in Sta. Croce there. A *St. Jerome* in San Bartolo at Pesaro; an *Enthroned Madonna with Four Attendant Saints*, at the Pieve of Gradara; a *St. Sebastian*, in the oratory of that saint at Urbino, besides a votive picture of the Buflì family in the Franciscan church there, and a fresco of a *Madonna and Child* in Raphael's house in Urbino are recognized as Santi's work. The Brera at Milan and the National Gallery in London possess examples of his art. He was also a poet; a MS. in the Vatican Library (*Codex Ollobonianus*, 1805), consisting of 344 folio leaves in *terza rima* exists, celebrating the virtues of Duke Federigo di Monte Feltro, and is interesting, as it contains allusions to the artists of the time and Giovanni Santi's sentiments and opinions on art. D. in 1494. W. J. STILLMAN.

**Santiago**, or **Santiago de Chile**, saān-tē-aa'gō-dā-chee-lā: capital and largest city of Chili; on a plain by the little river Mapocho; 68 miles E. S. E. of Valparaíso, its port (116 miles by rail); 1,755 feet above sea-level (see map of South America, ref. 8-C). It is the most populous city on the Pacific slope of America except San Francisco; is the center of Chilean wealth, fashion, and culture, and exhibits more luxury and taste in building than any other capital of South America. The situation, on the plateau called the valley of Chili, is very fine. The plain, naturally dry, has been improved by an elaborate system of irrigation which keeps the city gardens and parks always green. The snow-capped Andes, including the giant of the range, Aconcagua, are in plain view on the E., contrasting with the barren rocks of the Coast Range on the W. A single rocky hill, Santa Lucia, rises within the city limits, and has been transformed by private munificence into a beautiful park and pleasure-ground. The Alameda, a very wide street, crosses the city and is its main artery; it is ornamented by four rows of trees, with a central promenade and two driveways, and is set at intervals with statues, some of them spoils of the Peruvian war. Many of the finest public and private buildings and retail stores are on this street. The cathedral, municipal buildings, etc., face the old Plaza de Armas, now the Plaza de la Independencia. Among other public edifices may be mentioned the Hall of Congress, fronting a fine square, the mint, the opera-house, said to be the finest in America, and the Exposition Hall. Nearly all the better class of buildings are of stone, and many show great architectural taste. The residences are generally of two or at most three stories, and set in extensive grounds ornamented with orange-trees, etc.; for this reason the city occupies a very large area in proportion to its population. Dwellings are furnished with taste, often with great luxury. There are several public parks, and a well-stocked botanical garden. As a center of learning Santiago has a renowned university and various other institutions of higher education; a national library with 70,000 volumes and 40,000 manuscripts; a museum, academy of fine arts, observatory, etc. It is connected by railway with the northern and southern provinces, and with the coast. Commercially it yields in importance to Valparaíso. Santiago was founded by Valdivia, the conqueror of Chili, in Feb., 1541. Earthquakes are frequent, but have never been very destructive. The climate is changeable, ranging from 23.9° to 91.1° F. Pop. (1885) 189,332; in 1894 probably 225,000. The province of Santiago, of which the city is also the capital, has an area of 5,223 sq. miles, and a population of about 425,000. HERBERT H. SMITH.

**Santiago de Compostela**, -dā-kom-pōs-tā'lā: city; in the province of Corunna, Spain; at the confluence of the Sar and

the Sarela; 83 miles S. by W. of Corunna (see map of Spain, ref. 12-B). It is the see of an archbishop, and has a magnificent cathedral, a university, and several educational and religious establishments, from which it chiefly derives its importance. The cathedral is said to contain the bones of the patron of Spain, the apostle James. It was built in the eleventh century in the form of a cross, 270 feet long and 204 feet broad, and contains six naves formed by beautiful Gothic pillars. Before the Reformation this church was annually visited by great crowds of pilgrims, but the number of visitors has since decreased and the city decayed. There are manufactures of linen, silk, leather, and paper, and the vicinity is rich in cereals, vegetables, fruit, and wine. Pop. (1887) 24,302.

**Santiago de Compostela**: the name given to JAMES (q. v.), the son of Zebedee, as the patron saint of Spain.

**Santiago de Cuba**, -dā-koo'bā, or simply **Cuba** (in old books often called *St. Jago de Cuba*): city and port of Cuba; on a bay of the south coast, near the eastern extremity of the island (see map of West Indies, ref. 5-E). The harbor is one of the finest in the West Indies, but it is separated from the interior by rugged mountains which retard communication; hence the port is only the third in Cuba in importance. The city, surrounded on three sides by mountains, is very picturesque, but hot and subject to epidemics of yellow fever. The houses are generally low, but well built; there are few public edifices of note. The town has several fine squares and public gardens. Short railways run to the interior. Santiago is the center of the Cuban copper region. The principal exports are sugar, rum, coffee, cacao, fruits, and copper ore. Pop. (1891), with the district, 71,307; of the city proper, about 40,000. HERBERT H. SMITH.

**Santiago del Estero**, -dāl-ās-tā'rō: an interior province in the northern part of the Argentine Republic; surrounded by Santa Fé, Córdoba, Catamarca, Tucumán, Salta, and the territory of El Chaco. Area, 81,500 sq. miles. It is a plain, the greater part included in the region of mingled forests and open lands called the Gran Chaco; in the southern part there are true open pampas. The principal rivers are the Salado and Dulce, neither of which is navigable. Nearly all the civilized population is gathered in the S. of the Salado, about 18,000 sq. miles in extent. Grain, grain-planting, and timber-cutting are the only important industries. Pop. (1890) about 250,000 (including wild Indians). Santiago del Estero, the capital, on the Dulce, was founded in 1552, and (disregarding the first settlement of Buenos Ayres) is the oldest town in the republic. It is much decayed, and has frequently suffered from overflows of the river. Pop. 8,000. HERBERT H. SMITH.

**Santiago de los Caballeros**, -dāl-lōs-kāā-baal-yā rō, or **de la Vega**: town of the Dominican Republic; West Indies; in the central plain called the Vega Real; 85 miles N. N. W. of Santo Domingo, on the road to Puerto Plata (see map of West Indies, ref. 5-H). This is the most beautiful and fertile part of the island, and is free from the heat and fever of the coast. The town is the most populous in the interior of the republic, and has a thriving trade, especially in tobacco. Pop. about 10,000. H. H. S.

**Santillana**, saān-tēel-yaa'nā, INIGO LOPEZ DE MENDOZA Marquis of: soldier and poet; b. at Carrion de los Condes, Spain, Aug. 19, 1398; son of the grand admiral of Castile; was created Marquis of Santillana by Juan II. of Castile for his services in wars against Aragon and the Moors, and after the battle of Olmedo against the King of Navarre in 1446 received the title of Conde del Real de Manzanares. Upon the death of Juan in 1454 Mendoza retired from public life and devoted himself to literature. His best-known work is *Los Proverbios*, or *Centiloquio* (1496), a collection of 100 proverbs in rhyme. He wrote also *Diálogo de Bias con Fortuna* (1448); *Doctrinal de Privados* (1453); the *Comedia de Ponza* (a dramatic poem); and *serranillas*. D. at Guadalupe, Mar. 25, 1458. His works have been edited by Andador de los Rios (Madrid, 1852).

**Santley**, CHARLES: baritone singer; b. in Liverpool, England, Feb. 28, 1834; studied at Milan under Gaetano Navarini under Garcia on returning to England. He sang the part of Adam in Haydn's oratorio *The Creation*, at St. Martin's Hall in London, Nov. 16, 1857. In 1859 he appeared in the opera of *Dinorah* with the Pyne and Harrison Company at Covent Garden theater; and in 1862 made his debut in Italian opera. He made a tour in the U. S. in 1871. In London he sang in *Zampa* and *The Waterman*, with the

epidemics of yellow fever, Santos is the most unhealthy port in Brazil. It is the outlet of the greater part of São Paulo, and exports more coffee than any other port in Brazil except Rio de Janeiro. Great numbers of immigrants pass through it. Santos was founded in 1539. Pop. about 20,000. Six miles S. of it is the small town of São Vicente, the oldest permanent settlement in Brazil (founded 1532), and until 1681 capital of the captaincy of the same name. H. H. S.

**Sanzio, RAPHAEL:** See RAPHAEL.

**São (sown) Carlos:** See CAMPINAS.

**São Francisco River:** a river of Brazil, rising in Minas Geraes near lat. 20° 30' S., flowing N., then N. N. E., and finally curving to E. S. E., and entering the Atlantic in lat. 10° 29' S. Length about 1,800 miles. It traverses the states of Minas Geraes and Bahia, and below its great bend separates Bahia and Sergipe on the S. from Pernambuco and Alagoas on the N. Among the great rivers of South America, the São Francisco ranks in length with the Orinoco; but, unlike the Orinoco, Amazon, and Paraguay, it is essentially a highland river, the greater part of its course being over the surface of the Brazilian plateau; and it is nowhere bordered by extensive forests. Its most remarkable feature is its division into an upper and a lower course by a series of rapids and a great cataract. These mark its descent from the plateau, after it has attained its full volume, only 200 miles from the sea. The cataract of Paulo Afonso is sometimes called the Niagara of Brazil, and it approaches Niagara in grandeur though differing greatly in appearance. The great river is here forced through a narrow gorge—in one place only 51 feet wide—and after rushing down a slope, forms three successive falls, with a total depth of 265 feet. The torrent is churned into a mass of foam, producing an effect of indescribable grandeur. Above this fall there are several rapids, and below it an unnavigable space where the river forms a deep cañon; the total obstructed portion is about 190 miles long. Below it the river is freely navigable from Piranhas to the sea, 148 miles; at Penedo, 30 miles above the mouth, it is nearly a mile wide. The bar, at high water, admits vessels of 15 feet draught. Above the falls there is a navigable space from Pirapora to Sobradinho, 984 miles. Of the numerous affluents the most important are the Paraupeba and Rio das Velhas on the right and the Paracatu, Urucuiyá, Carinhanha, Corrente, Rio Grande, and Rio Preto on the left. All of these are navigable for greater or less distances. The São Francisco was opened to free navigation in 1867, but no foreign commerce has been attracted to it. Brazilian steamers ply regularly on the upper course, which is connected with Bahia by railway; the Rio das Velhas is also navigated. The principal industry of the basin is cattle-raising, but it contains much agricultural and mining land. See Burton, *Exploration of the Highlands of Brazil* (1869); Halfeld, *Relatório concernente á exploração do Rio de S. Francisco* (1858) and *Atlas e Relatório* (1860); Roberts, *Relatório sobre o exame do Rio S. Francisco* (1880); Wells, *Three Thousand Miles through Brazil* (1886).

HERBERT H. SMITH.

**São Gonçalo, Rio:** See LAGOA DOS PATOS.

**São João** (-zhō-own') **da Barra, or da Parahyba**, -daa-pā-rah-ee-bā (formerly *Parahyba do Sul*): city and port of the state of Rio de Janeiro, Brazil; on the right bank of the Parahyba river, near its mouth. Formerly it was the commercial center of the lower Parahyba valley, but its importance has decreased since Campos has been united to the Bay of Rio de Janeiro by a railway. It is a port of call for coasting steamers, and exports sugar. The bar is passable only during spring tides; at other times vessels anchor in the roadstead. São João has an important sugar-factory. Pop. about 7,000. H. H. S.

**São João d'El Rei**, -del-rā'ēē: a town of the state of Minas Geraes, Brazil; 66 miles S. W. of Ouro Preto (see map of South America, ref. 6-G); is connected with Sabará and Rio de Janeiro by railway, and is the commercial center of a large district. It was founded about 1670, and was long famous for its gold and diamond mines. Cattle and hogs are raised in the vicinity, and hides, lard, and the favorite Minas cheeses are exported. Pop. about 10,000. H. H. S.

**São Leopoldo:** a town of the state of Rio Grande do Sul, Brazil; on the Rio dos Sinos, a branch of the Guahyba or lower Jacuhy; 20 miles N. of Porto Alegre (see map of South America, ref. 7-F). The first German colony in Brazil was established here in 1824, and the town is the center of a thriving agricultural region almost entirely peopled by

Germans or their descendants; it has railway and steamboat communication with Porto Alegre. German is the common language. Pop. about 7,000. H. H. S.

**São Luiz:** See MARANHÃO (the city).

**São Miguel:** See ST. MICHAELS.

**Saône**, sôn: a river of France which rises in the department of Vosges, at an elevation of 1,299 feet above the level of the sea; flows S. and joins the Rhône at Lyons. Its entire length is 282 miles; it is navigable for a distance of 170 miles below the city of Gray, department of Haute-Saône. It is joined by the Doubs on the left side.

**Saône-et-Loire**, -ā-lwāär: department of France; between the rivers Saône and Loire, and mostly occupied by the mountains of Côte-d'Or. The mountains are low, and rich in coal and iron, and on their slopes is produced the celebrated Mâcon wine. On the pastures along the rivers large herds of cattle and horses are reared. Iron plates and rails, machinery, etc., are manufactured in Creusot and other towns. Area, 3,302 sq. miles. Pop. (1891) 619,523.

**Saône, Haute:** See HAUTE-SAÔNE.

**São Paulo**, sown-pow'lo: a southeastern maritime state of Brazil; bounded by Minas Geraes on the N. and E., Rio de Janeiro on the E., the Atlantic on the S. E., Paraná on the S., and Matto Grosso on the W. and N. W. Estimated area, 112,330 sq. miles, but the boundary with Minas Geraes is unsettled. The Brazilian Coast Range, here divided by the Parahyba valley into two parallel chains, traverses the southeastern part, and is separated from the ocean by a narrow strip of lowland. Back of the mountains the surface is an irregular plateau, varied by hills and by the deep valleys of rivers which flow westward to the Paraná. The coast-strip mountains and a wide tract back of them were originally covered with forest, and this is the most fertile and thickly settled portion of the state. Bordering the Paraná and its branches there are other extensive forests inhabited only by a few roving Indians. The river Paraná forms the western boundary, and its branch, the Paranapanéma, separates São Paulo from Paraná. The Pardo, Tieté, and Aguapehy are important branches of the Paraná, obstructed by falls near their mouths, but partly navigable in their upper courses. On the Atlantic side the only important river is the Parahyba. The principal harbors are the Bay of Santos and the channel formed by the island of São Sebastião. The climate of the plateau is mild and salubrious; some coast towns, as Santos, are hot and unhealthy. A little gold is washed in the river-beds, and there are deposits of excellent iron, marble, etc. The forests are rich in cabinet woods. São Paulo is the most populous and thriving of the Brazilian states and the most important coffee-producing region of the world; the coffee zone includes the Parahyba valley and the forest strip back of the mountains; sugar-cane is extensively planted, especially in the coast belt; and on the plateau the grazing industry is important. The people, called Paulistas, have always been noted for their enterprising spirit. During the colonial period they discovered the mines of Minas, Goyaz, and Matto Grosso, settling in those regions and the southern province; and their slave-hunters were long a terror to the Indians of Paraguay. Of late they have covered a large part of the state with railways, encouraged exploration and settlement toward the Paraná, and developed manufactures; and they have given some of the best statesmen, authors, and engineers to Brazil. The captaincy of São Paulo, originally called São Vicente, was formed in 1534, with its capital at São Vicente, on the Bay of Santos; this was changed to São Paulo in 1600. The captaincy originally included all of Southern Brazil; Rio de Janeiro, Minas Geraes, Santa Catharina (with Rio Grande do Sul), Goyaz, Matto Grosso, and Paraná were successively cut off from it. Pop. (1888) estimated, 1,386,242; the calculated annual increase is 3.5 per cent. There are many German and Italian immigrants. H. H. SMITH.

**São Paulo:** capital and principal city of the state of São Paulo; on a small branch of the river Tieté; 236 miles W. S. W. of Rio de Janeiro (370 miles by railway), 38 miles from its port of Santos (see map of South America, ref. 6-G). Owing to its situation on the plateau and near the Tropics of Capricorn, it has a mild and very agreeable and healthy climate. It is well built, and has the aspect rather of a European than of a Brazilian town; there are a number of public gardens and parks. The old Jesuit college is used as the state-assembly building; other notable edifices

sionally fighting with muskets, and at the Garita San Cosme it did excellent service as infantry. After the war it was stationed at West Point to assist in the instruction of cadets at the U. S. Military Academy. In 1853 a detachment accompanied Stevens's survey of the Northern Pacific Railroad. In 1858 the company formed part of the Utah expedition, returning to West Point in the fall of the same year. In the fall of 1858 a detachment was sent to the Pacific coast, where it was engaged until 1861 in opening and repairing roads, constructing bridges, and in fortifying San Juan island and at the time of the boundary dispute. In 1861 this detachment proceeded to Washington, where it was engaged upon the defenses and in the instruction of volunteer troops in the preparation of siege-material. The main portion of the company was engaged during the summer of 1861 in the defense of Fort Pickens. In the fall of 1861 it joined the Army of the Potomac. An act of Congress of Aug. 6, 1861, added three companies, of 150 men each, to the engineer troops, and authorized one company of topographical engineers. In 1863 the Corps of Engineers and of Topographical Engineers were merged into one, and the strength of the battalion of engineers thus became five companies. One of these was not organized, however, until 1865. From the fall of 1861 until the end of the civil war the battalion formed part of the Army of the Potomac, and its services were invaluable. Under Capt. Duane (afterward brigadier-general and chief of the Corps of Engineers) the original company had been thoroughly instructed in pontoniering, sapping, and mining. This instruction pervaded the battalion, and it was thus enabled to give lessons to the volunteers which could be obtained from no other source. A number of volunteer regiments were organized as engineer troops, and in addition to these many infantry and artillery troops served as engineer soldiers when occasion required, the high character and intelligence of the volunteers rendering it an easy matter to find men capable of being quickly instructed in these duties. For mining at Vicksburg and Port Hudson practical miners were selected from the different regiments, and temporarily organized as military miners. The sapping at these sieges was done by details from the infantry, as it had been in the seventeenth century, before the time of Vauban. In all cases these troops served under the engineers when on engineer duty.

The most remarkable feats in this branch of the service during the war were, in mining, the Petersburg mine (July, 1864); in sapping, the siege of Fort Wagner before Charleston, July to Sept., 1863; and in pontoniering, the bridge across the James river at Charles City Court-house. The latter was over 2,000 feet long in pontons, besides 200 feet of trestle-work. It was built by the regular battalion of engineers, two companies of the Fifteenth New York and part of a company of the Fiftieth New York, in all about 450 men, in about five hours on the evening of June 15, 1864, the approaches having previously been prepared by the First New York Engineers. The stream was rapid and deep, in some places 85 feet. This was the longest floating bridge ever constructed by an army in the field. Another long bridge was built by the same troops over the Chickahominy in 1862. That stream was a less difficult one, and a large portion of the bridge was built on trestles and cribwork.

Upon the reduction of the army in 1870 the number of enlisted men in the battalion of engineers was limited to 354, one company being reduced to a skeleton of ten sergeants and ten privates; and in 1875 the number was further reduced to 200. In 1884 the number was increased to 450 and in 1889 to 500. One company of 100 men is stationed at the Military Academy at West Point, engaged in the instruction of cadets in practical military engineering. The others are stationed at the engineer school of practice at Willets Point, N. Y. They are kept thoroughly drilled as infantry, and are well instructed in field fortification, sapping, mining, pontoniering, field-sketching, and the service of submarine mines. The officers of the battalion are temporarily detailed from the Corps of Engineers, usually serving with it four or five years.

Napoleon I. considered the proper proportion of engineer troops to infantry to be 1:40. Since his day the advances in the art of war have largely increased this proportion. It should be especially large in a country like the U. S., where the army is rather a magazine of military knowledge than a force capable of resisting a powerful enemy. In France the proportion is about 1:21; in Great Britain, 1:20; in Germany, 1:25; in Russia, 1:18; in Austria-Hungary, 1:19; and in the U. S., 1:25.

O. H. EBNST.

**Sappey**, sāp'pā', MARIE PHILIBERT CONSTANT, M. D.: anatomist; b. at Bourg, department of Ain, France, Aug. 10, 1810; graduated M. D. from the Paris School of Medicine in 1843; in 1844 passed the *concours* for associate professor of surgery; in 1868 was appointed Professor of Anatomy. He is a member of many French and foreign medical and scientific societies, and an officer of the Legion of Honor. His great work is his *Traité d'anatomie descriptive* (1847-63, numerous editions).

S. T. A.

**Sapphire** [from O. Fr. *saphir* < Lat. *sapphirus* = Gr. *σάπφειρος*, from Heb. *sappir*, sapphire]: a gem, among the purest forms of corundum. However, it is not usually called sapphire by dealers in gems unless blue, the red stones being called rubies, the yellow ones Oriental topaz, the green Oriental emeralds, and the purple Oriental amethyst, industrially used for wire draw-plates, watch-jewels, phonograph points, etc. *Asteria* is a variety of sapphire which when cut round shows a star of bright rays, due to its crystalline structure. See CORUNDUM, RUBY, TOPAZ, and PRECIOUS STONES.

Revised by GEO. F. KUNZ.

**Sappho**, sāf'ō (Gr. *Σαπφώ*): the world's greatest poetess; b. at Eresos or at Mytilene in Lesbos, toward the latter part of the seventh century B. C., contemporary of Alcæus and Solon. In consequence of political troubles she had to take refuge in Sicily, but returned to Lesbos in course of time and there she died. The literary mythmongers of antiquity made up stories out of supposed allusions in her verses. Of this order is the romance of her hopeless love for the fair youth Phaon, and of her leap from the Leucadian rock. But the poetess of love fared worse with the comic poets of Athens, who could not understand the Lesbian songstress and who wrought their wicked will on her memory. To them Sappho was a courtesan; to them the school of maidens whom she trained in the service of the Muses and to whom she addressed her burning verses was a school of vice. Nowadays few are found to controvert the thesis that Sappho was a lofty as well as an ardent soul, to whom all lovers of true womanhood as well as of true art must do homage. Her poems, written in the Æolic dialect, "few but all roses," were arranged in nine books after the number of the nine Muses and according to the measures employed. Of these only two poems remain entire or nearly so, and there are besides a number of fragments, enough at all events to show her ardor, her tenderness, her playfulness, her love of art, her love of nature. In the handling of the language and of the metrical form she was a supreme artist, and if nothing else remained, the Sapphic strophe would be a monument of her genius. Editions of her poems have been published by Neue (Berlin, 1827); by Bergk, *Poeta Lyrici Græci*; by Wharton, with English translations (2d ed. 1887). See the elaborate work by Cippolini, *Saffo* (1890).

B. L. GILDERSLEEVE.

**Sapporo**, or **Satsūpōro**, sāp'pō-rō: a town in Yezo, Japan, and once the capital of the island; in a plain about 20 miles from the mouth of the Ishikari river (see map of Japan, ref. 3-E). When the colonization department (*Kaitakushi*) began its work in 1871, Sapporo became a center of activity. Planing-mills, silk-factories, an agricultural college with model farm attached, a brewery, etc., were organized. A mission from the U. S., with Gen. Horace Capron at its head, was located here, and professors from the U. S. were intrusted with the organization of the college. Since the breaking up, in 1881, of the very expensive colonization department, Sapporo has been merely chief town of one of the three prefectures of the island. Its port is Otaru, 22 miles distant, with which it is connected by a railway which extends inland 40 miles to the coal mines of Poronai.

J. M. DIXON.

**Saprophytes** [Gr. *σάπρος*, rotten + *φυτόν*, a plant]: plants which live upon the organic matter of dead plants or animals, or at least on their dead parts, as distinguished from PARASITES (*q. v.*), which live upon and obtain their food from living plants or animals. They are all colorless plants, or at least they are not green, and have suffered a greater or less structural degeneration of their vegetative organs, as in the case of parasites. In fact the effect of saprophytism upon the plant appears to be essentially the same as that of parasitism, a result to be anticipated, since in some cases a parasite may become saprophytic, while in others a saprophyte may become parasitic.

Saprophytes occur in four of the six great branches of the vegetable kingdom. Thus of the protophytes, some of the bacteria are saprophytes. Of the phycophytes, the black

ings of stone, 2 cathedrals, 30 churches, and a museum with a fine-art gallery and a library. It manufactures cloth, linen, tobacco, leather, earthenware, rope, etc., has large breweries, distilleries, vinegar-factories, and foundries, and carries on an extensive trade in grain, cattle, and fish. Pop. (1890) 123,410.

**Saratoga, Battle of:** a decisive battle of the Revolutionary war in the North American colonies. Burgoyne, in command of the British forces, had crossed the Hudson Sept. 13 and 14, 1777, and encamped his army on the heights and plains of Saratoga. Gates, who commanded the Americans, had in the meantime moved his army up to Stillwater and taken possession of Bemis's Heights, to the S. of Saratoga, near the river—a strong position—which he fortified. On Sept. 19 Burgoyne attacked the left wing of the American army under Benedict Arnold, and succeeded in holding the field, though he sustained a loss of over 500 men, that of the Americans falling below 400. Burgoyne then discovered that he had a dangerous foe in his front. He also learned of the capture of his fleet of boats laden with supplies by Lincoln's militia in his rear, and the destruction of his communications with Canada; but, receiving promise of aid from Sir Henry Clinton from below by way of the Hudson, he fortified his position and awaited the latter's coming. As Clinton did not arrive, Burgoyne, finding himself in danger of being cut off from retreat, and his supplies being nearly exhausted, determined to risk a battle, and on Oct. 7 advanced at the head of 1,500 men, with six pieces of artillery. His right was at once attacked by a New Hampshire brigade and Morgan's riflemen. Arnold, who had been relieved from command after the battle of Bemis's Heights owing to some misunderstanding with Gen. Gates, and acting without orders, placed himself at the head of the troops, and with great daring and recklessness led them into action. The British lines were repeatedly broken and Burgoyne with difficulty regained his camp, but with the loss of his able second, Gen. Frazer. Gen. Arnold was also severely wounded in the leg. Renewing the assault, the Americans gained a lodgment in the camp, when darkness put an end to the conflict. During the night Burgoyne retreated and took possession of the heights in his rear. Afraid of being surrounded, he continued his retreat next day to Saratoga. As he received no aid from Clinton, and as every line of retreat was closed to him, it was decided in council to propose a cessation of hostilities while terms of capitulation were being negotiated. Gates at first demanded an unconditional surrender, which Burgoyne refused, but on the 17th terms were agreed upon—the British to march out with the honors of war, and be permitted to embark for England, on condition of not serving against the U. S. again during the war. The number of prisoners surrendered was 5,752. Gates's army numbered upward of 10,000. The terms of the surrender were not ratified by Congress, Burgoyne's army being retained as prisoners until the close of the war. Burgoyne and several other officers, however, were permitted to depart; forty-two guns, between 4,000 and 5,000 muskets, and a large supply of ammunition were among the valuable captures.

Revised by F. M. COLBY.

**Saratoga Springs:** village (incorporated in 1826); Saratoga co., N. Y.; on the Adirondack, the Del. and Hudson, the Fitchburg, and the Sar. Mt. McGregor and Lake George railways; 38 miles N. of Albany, 182 miles N. of New York (for location, see map of New York, ref. 4-J). It is in the foot-hills of the Adirondack Mountains, has a small valley running through its center, is one of the most famous summer resorts, and is noted for the number and variety of its mineral springs. It is also widely known for the political conventions that have been held here. The village has the Holly system of water-works, supplied from mountain springs; efficient fire department; electric street lights; 3 public parks, Woodlawn, Yaddo, and Congress; several art galleries; and a large number of costly summer residences. It has wide, clean streets and extensive drives.

There are nearly forty mineral springs, of which the best known are the Congress, Vichy, Hathorn, Kissingen, Victoria, High Rock, Carlsbad, Red, Columbian, Royal, Magnetic, Geyser, Patterson, Favorite, Excelsior, Empire, and the Star. They are alterative, diuretic, cathartic, and tonic. (See also MINERAL WATERS.) Four miles E. is Saratoga Lake, a favorite place for regattas, with a straight-away course 3 miles long and wide enough to accommodate fourteen racing sculls abreast. The Saratoga Racing Association has grounds

near the village, with a mile-track and a grand stand accommodating 5,000 persons, and Woodlawn Oval, with the Saratoga Athletic Clubhouse, in the north end, has all conveniences for track and field sports.

The principal public buildings are the new Convention Hall, seating 5,000 persons (cost \$100,000); the town-hall, containing the courts and theater; and the armory of the Twenty-second Separate Company, N. G. S. N. Y. Of hotels, the largest are the Grand Union, the United States, and Congress Hall. These, with eight other large and numerous small ones, have accommodations for 40,000 guests. During the summer season they expend \$40,000 for orchestral music.

There are 2 Presbyterian, 2 Baptist, 2 Methodist Episcopal, and Congregational, Protestant Episcopal, and Roman Catholic churches. The educational institutions comprise seven public schools, including an academic and central grammar school, with enrollment of 2,300, and annual cost of \$40,000, and the Temple Grove Female Seminary, with accommodations for 200 pupils. The charitable institutions include the Children's Home, the Emergency Hospital, and the Home of the Good Shepherd. There are three libraries (Athenæum, Temple Grove Seminary, and Union Free School) with about 10,000 volumes, and a monthly, 2 daily, and 6 weekly periodicals. The annual receipts and expenditures of the village are about \$125,000 each; bonded debt, \$200,000; property valuation, \$6,000,000. In 1895 there were 2 national banks, with combined capital of \$225,000 and surplus of \$155,000. The principal industries are the bottling of mineral waters and the manufacture of medical supplies.

The name Saratoga is derived from the Indian, meaning "Hillside of the Great River." The territory was deeded, by the Indians to the Dutch in 1684. Rip van Dam was the first white owner of the original springs, and Sir William Johnson was the first who thoroughly tested their efficacy. The first hotel was established in 1774. Some of the mineral waters have been bottled and exported to various parts of the world since 1826. The Saratoga battle-field, where Gen. Burgoyne surrendered to Gen. Gates on Oct. 17, 1777, is 12 miles S. E. of the village. Pop. (1880) 8,421; (1890) 11,975; (1895) estimated, 15,000.

LA MONTE WALDRON, EDITOR OF "DAILY SARATOGIAN."

**Sarawak:** a British dependency on the northwest coast of Borneo. It was granted in 1842 to Sir James Brooke, with the title of rajah, by the Sultan of Brunei. He was succeeded in 1868 by his nephew, Sir Charles Brooke, and in 1888 the state was placed under the protection of Great Britain. Area, 50,000 sq. miles. Pop. about 300,000, consisting of native races—Malays, Dyaks, Tayans, and Muruts, as well as some Chinese. The capital, Kuching, has about 25,000 inhabitants, and carries on a large and steadily increasing trade in timber, edible birds' nests, gutta-percha, sago, antimony ore, and rice, in exchange for which it imports European manufactures and tobacco. The revenue for 1893 was \$457,123; expenditure, \$478,198.

Revised by M. W. HARRINGTON.

**Sarcocolla** [= Lat. = Gr.; *sarx*, *sarx*, flesh + *κόλλα*, glue] a nauseous gum-resin produced by *Penaea sarcocolla*. *P. mucronata*, *Sarcocolla vulgaris*, etc., evergreen shrubs of the order *Penaeaceae*, ranging from the Euphrates to the Cape of Good Hope. It is seldom used in civilized regions.

**Sarcophagus** [= Lat., from Gr. *sarxophagos*; scil. *αἶμα*, *liter.*, flesh-consuming stone; *sarx*, *sarx*, flesh + *φαγῆναι*, eat]; primarily a limestone found in Assos in the Troad, used for making coffins which were supposed to have the property of destroying the corpse within a brief period. The name came thus to be applied to all stone coffins, and loosely also to any large coffin of other material. The earliest specimens are those of Egypt, which were made of granite, basalt, limestone, alabaster, and jointed wood. In the course of time the forms underwent considerable change. The earliest are from the fourth dynasty and are rectangular, with a flat or curved cover, with little or no ornamentation, and in the shape of an Egyptian house. From the Middle Kingdom the specimens are mainly of wood, the tops being intersected by lines of inscriptions, with figures of gods in the open spaces. Outside they were painted and adorned with false doors, while the interiors were adorned with sacred texts. In the New Kingdom both stone and wood were used, and a more artistic form employed. Sacred texts were placed on papyrus rolls instead of on the coffins, so that the flat sides were no longer needed for this purpose. As a consequence a

hood as a teacher and by writing for papers, magazines, and cyclopedias; tried his fortune as a dramatist in 1854 with the *Taverne des Étudiants*, which failed; tried again in 1860 with *Candide* and *Monsieur Garat*, which succeeded; and then wrote a number of plays with a rapidity almost unparalleled: *Les Pattes de Mouche*, *Piccolino*, *Les Femmes fortes*, and *Nos Intimes* in 1861; *Les Ganaches*, *La Papillonne*, and *Les Premières Armes de Figaro*, in 1862; *Bataille d'Amour* and *Les Diables noirs* in 1863; *Don Quichotte* and *Les Pommes du Voisin* in 1864; *Les Vieux Garçons* and *La Famille Benoiton* in 1865; *Nos Bons Villageois* and *Maison neuve* in 1866, etc. Most of these plays made a great and decided success, and the author took rank by general consent as the first playwright of his age, ruling the stage wherever there is one. The most prominent of his later works are *Séraphine* (1868); *Patrie* (1869); *Fernande* (1870); *Divorçons* and *Daniel Rochat* (1880); *Odette* (1881); *Fédora* (1882); *La Tosca* (1887); *Cléopâtre* (1890); *Thermidor* (1891); *Gismonda* (1894). He received the decoration of the Legion of Honor in 1863, and was received as member of the French Academy May 23, 1878.

Revised by A. G. CANFIELD.

**Saree'**: town; in the province of Mazanderan, Persia; on the Tejen, 18 miles from its mouth in the Caspian Sea (see map of Persia and Arabia, ref. 2-H); center of a rich and fertile country; is an old place, mentioned by Firdausi, but long ago lost its importance. In 1836 cholera destroyed nearly the whole population, and since that time it has been rising very slowly. Pop. estimated at 8,000.

**Sargas'so Seas** [*Sargasso* is from Span. *sargazo*, seaweed]: areas in the North Atlantic, North Pacific, and other oceans, having an abundance of the seaweed *Sargassum bacciferum*. The best known is that in the North Atlantic, which is the central area of a whirl of currents, and is a region of light winds. It extends from the Azores to the Antilles, and from lat. 16° N. to lat. 38° N., but the sargasso is most abundant W. of lon. 45° W. The seaweed is found in the Gulf Stream and neighboring waters, and is often cast upon the shores of the West Indies and Florida. In the Sargasso Sea it is in streaks, often scores of feet long, or in islands which may cover many acres, but the outlines of which are constantly changing. It forms a thin superficial layer and offers no resistance to ships. There are twenty to twenty-five plants, on the average, to each square mile, and each plant when pressed together makes from a pint to a quart when wet, or about one-eighth of this when dry. The plant vegetates freely on the Sargasso Sea, but has not been found fructifying there. Its color is greenish olive, varying with age from yellowish to whitish, and bears many berry-like lumps or floats. The patches of seaweed have a veritable fauna of fish, crustaceans, and molluscs numbering sixty or seventy species, several of which have developed marked features of protective imitation. One remarkable fish (*Antennarius marmoratus*), 2 to 4 inches long, can be distinguished from the plant only by close inspection. The Sargasso Sea has remained substantially in the same place and with the same characteristics for the 400 years since Columbus's first voyage.

MARK W. HARRINGTON.

**Sargent, Aaron Augustus**: U. S. Senator; b. at Newburyport, Mass., Sept. 28, 1827; was in early life a printer and editor; emigrated to California in 1849; studied law while editing *The Nevada Journal*; was admitted to the bar 1854; was district attorney of Nevada County 1855-56; vice-president of the Republican national convention at Chicago 1860; M. C. 1861-63 and 1869-73, and U. S. Senator for the term 1873-79. Became U. S. minister to Germany 1882; resigned in 1884. He was the author of the first Pacific railway act passed by Congress. D. in San Francisco, Cal., Aug. 14, 1887.

**Sargent, Charles Sprague**: arboriculturist; b. in Boston, Mass., Apr. 24, 1841; graduated at Harvard College 1862; from that time served in the Union army until the close of the civil war, attaining the rank of major; then traveled in Europe; appointed director of the Arnold arboretum and botanic garden of Harvard College in 1872, holding that position six years; in 1878 appointed Arnold Professor of Arboriculture in Harvard College; in 1879 became special agent of the tenth census to collect statistics in regard to the forests of the U. S.; became head of the forest division of the northern transcontinental survey; in 1888 became editor of *Garden and Forest*; has written many papers for scientific and other journals on botany, forestry, etc. He is the author of *Report on the Forests of North America*

(being vol. ix. of the *Reports of the Tenth Census of the United States, 1883*); *The Woods of the United States, with an Account of their Structure, Qualities, and Uses* (1855); *The Silva of North America* (begun in 1891); and *Notes on the Forest Flora of Japan* (1894).

Revised by CHARLES E. BESSEY.

**Sargent, Epes**: journalist and author; b. at Gloucester, Mass., Sept. 27, 1813; educated at the Boston Latin School and Harvard College; was editorially connected at different times with the *Boston Advertiser* and *Atlas* (1837), the *New York Mirror* (1839) and *New Monthly Magazine* (1845), and the *Boston Evening Transcript* (1846). In 1847 he settled at Roxbury, near Boston, and devoted himself entirely to literary work. He was an industrious compiler of readers and speakers for schools; edited many reprints and collections, and wrote a number of successful plays, such as the *Bride of Genoa* (1836) and *Velasco* (1837), besides tales for the young, poems, and novels, some of which were once popular, but are mostly forgotten. Some of his songs were spirited and were set to music. The best known of them is *A Life on the Ocean Wave*. Perhaps his *Life of Henry Clay* (1842) and his *Songs of the Sea* (1847) have the best title to remembrance among his original writings. D. in Boston, Dec. 31, 1880.

H. A. BEERS.

**Sargent, John Singer**: portrait and figure painter; b. in Florence, Italy, of American parents, in 1856; pupil of Carlus Duran, Paris; honorable mention, Paris Salon, 1875; second-class medal, Paris Salon, 1881; medal of honor, Paris Exposition, 1889; Legion of Honor 1889. He is one of the greatest living portrait-painters. His works are distinguished by consummate technical skill, and are excellent in the representation of character. He has painted many portraits in Paris, London, New York, and Boston. He lived in Paris for a number of years, from about 1872 to 1885, then went to London where he has since resided. He visited the U. S. in 1888, 1889, and 1891. His picture of a Spanish dancer, *La Carmencita*, first exhibited at the Society of American Artists, in New York in 1890, was bought by the French Government in 1892. He is a member of the Society of American Artists (elected 1880), an associate member of the National Academy, and a member of the Société Nationale des Beaux-Arts, Paris.

W. A. C.

**Sargent, Winthrop**: soldier; b. at Gloucester, Mass., May 1, 1753; graduated at Harvard 1771; became captain of one of his father's ships 1775; navy-agent at Gloucester 1776; served at the siege of Boston as captain of artillery, and subsequently in the Long Island, New Jersey, and Pennsylvania campaigns, attaining the rank of major; was connected with Gen. Rufus Putnam's Ohio Company; was made by Congress surveyor-general of the Northwest Territory 1786; became its secretary 1787; was its Governor 1798-1801; was adjutant-general of St. Clair's expedition against the Miami Indians 1791, and in Wayne's expedition 1794-95, being wounded in the former; was a member of the American Academy of Arts and Sciences and of the Philosophical Society, and an original member of the Society of Cincinnati as delegate from Massachusetts; aided Dr. Benjamin S. Smith in preparing his *Papers Relative to certain American Antiquities* (1796); published *Boston*, a poem (Boston, 1803); was Governor of Mississippi Territory 1790, and again 1801. D. in New Orleans, June 8, 1820.

**Sargent, Winthrop**: author; grandson of Maj. Winthrop Sargent; b. in Philadelphia, Pa., Sept. 23, 1825; graduated at the University of Pennsylvania 1845, and at Cambridge Law School 1847; practiced his profession in Philadelphia, and subsequently in New York; edited from original MSS., with a valuable introductory memoir, *The History of Braddock's Expedition against Fort Duquesne* (Philadelphia, 1855); edited *The Loyalist Poetry of the Revolution* (1857) and several reprints of curious Revolutionary tracts; and was author of *The Life and Career of Major John André, Adjutant-General of the British Army in America* (Boston, seventy-five copies only, 1861), a work of extraordinary research. He wrote largely for *The North American Review* and other magazines; was an accomplished bibliographer; was for many years engaged in preparing a *catalogue raisonné* of books relating to America (unfinished). D. in Paris, France, May 18, 1870.

**Sar'gon** [Assyr. *Sharru-kenu*, the true king]: King of Assyria 722-705 B. C.; founder of the last and most illustrious Assyrian dynasty 722-606 B. C. He appears to have been a usurper, though probably of royal stock. Numerous records

thin ligneous layer, and a central medulla, which often abounds in starch. The roots have scarcely any smell, but when chewed produce a disagreeable acrid impression in the mouth, which persists for some time. Sarsaparilla contains a crystallizable principle called parillin, upon which such medicinal virtues as the drug possesses most probably depend. There are various sorts of sarsaparilla, obtained from different localities, which are most easily grouped into the mealy and non-mealy, according to the proportion of starch they contain. Of the mealy are Honduras, Guatemala, and Brazilian or Lisbon sarsaparilla, and of the non-mealy Jamaica, Mexican, and Guayaquil. Sarsaparilla was at one time held in high esteem as a medicine, principally as a remedy for syphilis, but it is now accorded but feeble power, and where used is prescribed simply to assist the action of more potent drugs.

Revised by H. A. HARE.

**Sarsfield, PATRICK**, Earl of Lucan: Jacobite soldier; b. in Ireland about 1645; served on the Continent in the English Life Guards, under the Duke of Monmouth, and against him at Sedgemoor 1685; was at the Revolution a member of the Irish Parliament and one of the wealthiest and most influential Irish Roman Catholics; adhered to the cause of King James, to whom he offered his services in 1689; fought at the battle of the Boyne July 1, 1690; surprised the English artillery before Limerick, and compelled William III. to raise the siege Aug., 1690; commanded the Irish reserve at the battle of Aughrim July 12, 1691; exhibited great gallantry in the second defense of Limerick; obtained honorable conditions of surrender Oct., 1691; retired to France with a corps of Irish volunteers; distinguished himself at Steenkirke Aug., 1692, and was killed at the battle of Landen July 19, 1693.

**Sartain', JOHN**: engraver, designer, and literary editor; b. in London, England, Oct. 24, 1808; became an engraver and did some important work, including some of the plates for William Young Ottley's works on early Italian prints. He removed to the U. S. in 1830, and settled in Philadelphia. He is generally thought to have introduced mezzotint engraving into America. He also practiced oil-painting and miniature-painting on ivory and vellum. Afterward he was editor and proprietor of *The Foreign Semi-monthly Magazine*, and having bought *The Union Magazine* renamed it, and became the founder of *Sartain's Union Magazine*. He was the designer of several public monuments, among which is that to Washington and Lafayette in Monument Cemetery, Philadelphia.

Revised by RUSSELL STURGIS.

**Sarthe, sãrt**: department of France, extending on both sides of the Sarthe; comprises an area of 2,396 sq. miles. The surface is mostly level, and the soil often light and sandy. Wheat and wine are produced, but the rearing of cattle, poultry, and bees is the chief occupation. The manufactures comprise iron, glass, porcelain, and falence. Capital, Le Mans. Pop. (1891) 429,737.

**Sarti, GIUSEPPE**: composer; b. at Faenza, Italy, Dec. 28, 1729; received his musical education in Bologna; composed his first opera in 1752, *Pompeo in Armenia*, which had success; was director of the opera at Copenhagen 1756-65; visited London in 1769-70; was chapel-master at the Cathedral of Milan 1779-84; went in that year to St. Petersburg as director of the opera. D. in Berlin, July 28, 1802. He composed over thirty operas, of which none, however, made any great impression, but of his church music his terzetto, *Amplius Lava Me*, is still remembered. He was the teacher of Cherubini.

**Sarto, ANDREA**, del; properly ANDREA D'AGNOLO, named *del sarto*, or [son] of the tailor, from his father's calling: painter; b. probably at Gualfonda, in Tuscany, in 1487. It is commonly stated that his family name was Vannucchi. He was apprenticed to a goldsmith, then to Giovanni Barile, a Florentine painter of no eminence, and finally to Piero di Cosimo, an artist of ability, with whom Andrea remained for some years. He was still a very young man when he painted the frescoes at the convent of the Servi, in Florence, on the square of the Annunziata, and those of the convent of the Scalzo in the old Via Larga, now Via Cavour. By the time he was twenty-five he was one of the best fresco-painters in Florence, and also a consummate painter in oil. From that time until his death he was the generally accomplished artist, capable of any kind of work, and incapable, in a sense, of error, as his nickname, *Andrea senza errore*, suggests. Without great elevation of style or much originality of conception, he was still a painter of delightful pictures,

the color of which is especially to be enjoyed. In 1518 he went to the court of France and painted for King Francis I., and the story is told that the king intrusted money to him to be used in the purchase of pictures in Florence, and that Andrea misappropriated it. He was certainly in Florence again in 1521, and never left Italy, and rarely Florence, after that time. D. in Florence, Jan. 22, 1531. Of his numerous frescoes, those in the convent of the Servi represent scenes in the legendary *Life of St. Philip, a Birth of the Virgin*, in which a lovely female figure is asserted to be a portrait of the artist's wife, and a *Procession of the Magi*. In a cloister adjoining is the noble fresco of the Holy Family called *La Madonna del Sacco*, because St. Joseph is leaning on a large full sack. The frescoes in the Scalzo convent are in monochrome, a series of biblical subjects with ornamental borders. At Poggio a Caiano is a very important fresco of *Cæsar receiving Tribute*. Of his easel-pictures one of the finest is in the Louvre, *Charity*. There are also there two pictures of the *Holy Family* and an *Annunciation*. In the London National Gallery is a valuable portrait of himself. In the Pitti Palace there are two *Annunciations*, a *Deposition from the Cross*, the portraits of himself and wife, and a dozen other pictures of value. In the Uffizi Gallery is the *Madonna di San Francesco*. Very many other paintings are to be seen in public and private galleries throughout Europe.

RUSSELL STURGIS.

**Sarto'ris, ADELAIDE (Kemble)**: See KEMBLE.

**Sarts**: a name applied to the sedentary natives, as distinguished from the nomads, in Turkestan and neighboring parts of Central Asia, whatever their ethnic relations, but sometimes limited to the sedentary population of Turkish language and relationship in Russian Turkestan. As thus limited they number about 700,000, are homogeneous, devoted to trade, are Mohammedans, and have a considerable sacred literature.

M. W. H.

**Sartwell, HENRY PARKER, M. D., Ph. D.**: botanist and physician; b. at Pittsfield, Mass., Apr. 18, 1792; surgeon in the U. S. army during the war of 1812-15; settled at Bethel, Ontario co., N. Y., 1821, and at Penn Yan 1832; for more than forty years was an enthusiastic botanical collector, forming an herbarium of 80,000 species, owned by Hamilton College, Clinton, N. Y. About 1846 he devoted his whole time to the study of the genus *Carex*, and brought out *Carex Americana Septentrionalis Exsiccata* (2 parts, New York, 1848; part iii. unfinished). D. at Penn Yan, Nov. 15, 1867.

**Saskatchewan**: district of the Northwest Territories of Canada, between lats. 52° N. and 55° N., with Keewatin and Manitoba on the E. and Alberta on the W. Area, 107,042 sq. miles. It is a well-watered and wooded country, thickly scattered with lakes, especially in the northern half, and is crossed from W. to E. by the Saskatchewan river. It is generally level or gently rolling, but a series of lofty hills follow along the south bank of the river just named. A large part of it is considered suitable for colonization, and it is made accessible by a railway extending from Prince Albert southward to Regina on the Canadian Pacific Railway, and by the Saskatchewan, which is navigable. The population in 1891 was 11,150, of whom over half were Indians and nearly one-fourth half-breeds. The latter are mostly of French descent, and, with a few of pure French race, are for the most part settled about Batoche on the South Saskatchewan. The agricultural products are yet small, and include live stock, wheat, barley, oats, peas, and potatoes. There is also a considerable production of pelts, mostly musk-rat. The chief settlements are Battleford and Prince Albert.

MARK W. HARRINGTON.

**Saskatchewan River**: a river which rises on the eastern slope of the Rocky Mountains in two main branches, flows eastward for about 1,200 miles, and empties into Lake Winnipeg. A few of the minor branches of the South Saskatchewan have their sources in the U. S. It is a part of the drainage system that reaches Hudson Bay through Nelson river, which is one of the great hydrographic basins of North America. From the junction of the North and South Saskatchewan to Lake Winnipeg the river flows through the deserted bed of Lake Agassiz. The sources of the north and south branches are stated by Dr. Hector to be but a few miles apart, in a nucleus of lofty summit-glaciers about lat. 51° 40' N., lon. 117° W., near Mt. Hooker, 15,700, and Mt. Brown, 16,000 feet in height, where the Rocky Mountains are 200 miles in breadth. Thence diverging 300 miles apart, midway, they unite at 550 miles in direct distance eastward.

a smooth and lustrous fabric of silk, of Chinese invention. Of the warp threads only one in every five or ten is raised to allow the shuttle to be passed, but each thread is raised in regular succession as the shuttle is thrown. It is woven with the right side uppermost.

**Satin Bower-bird:** See BOWER-BIRD.

**Satinet:** a coarse fabric, of which the warp is cotton and the weft woolen; originally, an inferior variety of satin.

**Satin-spar:** a fibrous variety of carbonate of lime, of snowy whiteness, found in England, Scotland, and elsewhere, which when polished has a luster resembling that of satin. A fibrous kind of GYPSUM (q. v.), also called satin-spar, is softer than the above, and is frequently made into ornaments resembling cat's-eye.

**Satin-wood:** a name given to several kinds of ornamental wood. The best is from Guiana, and is the wood of *Ferolia guianensis*, now included in the genus *Parinarium*. Florida satin-wood is from *Xanthoxylum floridanum*, a kind of prickly-ash tree. The West India satin-wood is from different trees, some of it of the very best and others of the poorest quality. The rich and fragrant satin-wood of India is usually of good quality. It comes from the *Chloroxylon swietenia*, a cedrelaceous tree which yields a sort of wood-oil. Satin-wood is used in making workboxes, hair-brushes, and cabinet-work.

Revised by L. H. BAILEY.

**Sature** [viâ O. Fr. from Lat. *satūra*, *satūra* (sc. *lanx*, dish), a dish filled with various kinds of fruits, food composed of various ingredients, a mixture, medley, liter., fem. of *satur*, filled with food, sated]: a form of composition, which, as an attack on the weakness and wickedness of humanity, belongs to all mankind and to universal literature. Prose is at its service as well as poetry; it may take the shape of sermon as well as song. It may be dramatic, as in comedy, mask, and mummery. It may be epigrammatic, as in lampoon and pasquinade. It may be indirect, as in parody and travesty. It may be a formal diatribe; it may be an informal skit. Satire is older than comedy, for the *silli* of XENOPHANES (q. v.) were satirical and every phase of satire was represented in Greek literature. But the great models of satirical art are found in Roman literature. Whenever satire as literature is mentioned Horace and Persius and Juvenal come up to the mind, and the satire is assuredly most congenial to the Italian temperament, ancient and modern. Nor were the Romans slow to claim satire as their especial province. *Satura quidem*, says Quintilian (x., 1, 93), *tota nostra est*, and the loss of the Greek forerunners has enabled the Romans to make good their claim here as in the whole field of didactic poetry to which satire stands related as does the application to the sermon. The first appearance of *satura* in Roman literature is in the *saturæ* of ENNIUS (q. v.), where it is evidently a medley in verse; the *Satura Menippeæ* of VARRO (q. v.), of which we have considerable fragments, are in prose and verse, as is the so-called *Satiricon* of PETRONIUS ARBITER (q. v.).

The subjects of Ennius and of Varro covered a wide range, and their miscellaneous character corresponds to the original meaning of the word. In the hands of Lucilius the *satura* was largely used as an instrument for personal attack on the characters of those who had stirred the poet's indignation, and, though the fragments of Lucilius show that motley was the wear of his muse also, still the Lucilian satire has narrowed the range of the word, just as the mocking epigram has prevailed over all the other Greek forms, and just as elegiac has become synonymous with plaintive. In its function, then, the satire was assimilated to that especial form of the Old Attic comedy which dealt with personal abuse, the form known as the *lampuch* *lêta*; and when the native historians of Roman literature followed the established fashion of paralleling Roman with Greek and tried to adjust the growth of Roman comedy to Aristotle's schemes for Greek comedy, the *satura* naturally took the place of the Old Attic comedy, and the resemblance was emphasized by Horace and Persius themselves. Cratinus, Aristophanes, and Eupolis were claimed as brothers of the same guild. In view then of the largely doctored accounts given by the Romans, both of their history and their literature, scholars may be forgiven for questioning the very existence of the dramatic *satura*, which is said to have been a manner of acted lampoon, akin to the rude *versus Fescennini* of the populace; and it has been recently maintained that this is only another Roman adaptation, another reconstruction of early Roman literary history

after Greek models, just as so much Roman political history has been reconstructed after Greek models. Still it is not to be denied that there is a dramatic element in the classic satires of Rome. It comes out in sundry of the satires of Horace and is awkwardly conspicuous in Persius, but perhaps both these poets are simply living up to a theory. In Juvenal, the third of the great Roman satirists, the dramatic element is not a marked feature, and his declamatory rhetoric has had more influence on modern satire than Horace's *bonhomie*, or the priggish wisdom of Persius. By concentration, then, and crystallization the satire proper came to be as we still have it. Poetry became the medium and the hexameter the form, and though the satirical spirit might manifest itself in prose-fiction with interlarded verse, as in Petronius, or in the various measures employed by Catullus and Martial, satire as such had received its type, and that type is still potent. The accepted satire is in verse and that verse the heroic verse of the nationality—in French the alexandrine, in English the decasyllabic. French satire is represented by Boileau, English satire by Dryden and Pope, for Dryden and Pope are the models, not Butler—*Abraham* and *Achitophel* and the *Dunciad*, not *Hudibras*. Of course, if the term satire is widened to meet the definition given at the outset of the article it will be necessary to include a vast body of literature: Lucian and Apuleius, *Reynard the Fox*, *Tytl Eulenspiegel* (*Howleglas*), the *Piers Plowman* of Langland, the *Epistolæ Obscurorum Virorum*, and so on, down through moralists, essayists, and novelists without number, of all nationalities and of every century. Momus, the spirit of mockery and fault-finding, the son of Night, appears early in the list of Greek divinities, and his worship and his influence are universal. B. L. GILDERSLEEVE.

**Satire Ménippée**, *saâ'têr'mâ'nêp'pâ*: a famous French satire, so called from the Greek philosopher Menippus, who used in his works the form of prose interspersed with verse, in which it is composed. It is due to the collaboration of Pierre Le Roy, Jacques Gillot, Nicolas Rapin, Jean Passerat, Florent Chrestien, and Pierre Pithou, and appeared in 1594, after having circulated privately in manuscript. It was aimed against the league, and its fuller title was *De la Vertu du Catholicon d'Espagne et de la tenue des Etats de Paris*. It reflects the temper of the bourgeoisie, worn out by the civil strife, and putting the peace and unity of their country above party. Good editions are those of Ch. Read (1876) and C. Labitte (1880).

A. G. CANFIELD.

**Satisfaction:** See ACCORD AND SATISFACTION, JUDGMENT, MORTGAGE, PAYMENT, and RELEASE.

**Satow**, *saât'ô*, ERNEST MASON, B. A., C. M. G.: scholar and diplomatist; b. in London in 1842. Appointed student interpreter in Japan in 1861, he was present at the action at Kagoshima, Sept., 1863, and acted as interpreter at the bombardment of Shimonoseki, Sept., 1864. In 1876 he was promoted to be second secretary of legation at Tokio, and in 1883 received the decoration of the cross of St. Michael and St. George. During this period he had obtained a profound acquaintance with the language, history, and antiquities of Japan. In 1884 he was transferred to Siam as agent and consul-general at Bangkok, and became minister resident in the following year. He was transferred to Montevideo in 1888, and in 1893 was promoted to be envoy extraordinary and minister plenipotentiary at the court of Morocco. He has published an English-Japanese dictionary, and has contributed valuable articles to the *Transactions of the Asiatic Society of Japan*.

J. M. DIXON.

**Satpura**, *sât-poo'râa* [from Sanskr. *gata*-, hundred + *pu'ra*-, castle, fortified town]: a name originally restricted to the mountains which divide the Nerbudda and Tapti valleys, Northern India, but now generally applied to the great range or table-land which, commencing E. of the famous Amarkantak plateau, runs nearly up to the western coast. Accepting Amarkantak as the eastern boundary, the Satpuras have a range from E. to W. of about 600 miles, and in their greatest depth exceed 100 miles from N. to S. The shape of the range is almost triangular; from Amarkantak, 3,328 feet above the level of the sea, an outer ridge runs S. W. to a point in the Bhandara district. The average height at the crest of the chain is but little under 2,000 feet above the sea; the highest peak, Dhupgarh, in Hoshungabad, rises as high as 4,454 feet. Nearly the whole range consists of trap; toward the W. a series of craggy peaks is met with.

**Satrap** [viâ O. Fr. from Lat. *satrapes* = Gr. *σατράπης*, from O. Pers. *khšatrapāvā*; *khšatra*-, rule, power + *pā*-,

dancing Kuretes. In their earliest form they were caricatures of the elder or bearded Dionysus; they were half-animal, and were depicted in early vase-paintings with long sharp-pointed ears, long horse-tails, long hair, and long, pointed beards. They were half-animal, not only in form, but in character; they were lustful and sensual, and vase-paintings represent them as ravishers of the nymphs and Bacchantes, and even of Iris. This antique type of satyr was supplanted by a less sensual type, which was created by Praxiteles in his famous statue, and has remained the norm of the Satyr. In the Satyr of Praxiteles we have the Puck of antiquity, the figure of a lusty youth, in which the animal nature is brought out by the goat-ears, the teat-like protuberances (*phrea*) on the neck, the animal cast of countenance, stump nose, bristly hair, thick lips, cynical smile, and diminutive tail. In some cases sprouting horns on the forehead indicate a transition stage between the Satyr and Pan and Panisks. The Satyr must be carefully distinguished from Pan and Silenus, and especially from the Faunus of the Romans, a creation that arose from their confounding the Satyrs and Pans. J. R. S. STERRETT.

**Saugerties**, saw'ger-teez: village; Ulster co., N. Y.; on the Hudson river at the mouth of Esopus creek, and on the West Shore Railroad; 12 miles N. of Kingston, the county-seat (for location, see map of New York, ref. 7-J). It is in an agricultural region, has good water-power for manufacturing, and ships large quantities of bluestone, limestone, and agricultural products. There are 7 churches, 4 graded schools forming Union Free School District No. 10, a parochial school, a Young Men's Christian Association with library and reading-room, a national bank with capital of \$200,000, a state bank with capital of \$125,000, a savings-bank, manufactories of paper, blank books, brick, and wood-pulp, and a daily, a monthly, and 2 weekly periodicals. Pop. (1880) 3,923; (1890) 4,237; (1895) estimated, 6,000.

EDITOR OF "DAILY POST."

**Saugor**: island and town of India. See SAGAR.

**Sauk Center**: city (founded in 1857); Stearns co., Minn.; on the Sauk river, and the Gt. North. and the N. Pac. railways; 117 miles N. W. of St. Paul, the State capital (for location, see map of Minnesota, ref. 8-C). It is in an agricultural region, has several flour-mills and other manufactories, and contains 10 churches, public graded and high schools, private academy and training school, a national bank with capital of \$50,000, 2 private banks, and 2 weekly newspapers. Pop. (1880) 1,201; (1890) 1,695; (1894) school census, 1,955.

EDITOR OF "HERALD."

**Sauk Rapids**: village (located in 1850); capital of Benton co., Minn.; on the Mississippi river, and the Gt. North. and the N. Pac. railways; 75 miles N. W. of St. Paul, the State capital (for location, see map of Minnesota, ref. 8-D). It has excellent water-power and extensive quarries of fine granite, is engaged in farming and dairying, and contains 6 churches, high school, German Lutheran school, steam sawmill, planing-mill, feed-mill, and 2 weekly newspapers. Pop. (1880) 598; (1890) 1,185; (1895) estimated, 2,800.

EDITOR OF "SENTINEL."

**Saul** [from Heb. *Shā'ul*, liter., asked for]: the first King of Israel, a son of Kish, of the tribe of Benjamin; was anointed by Samuel; fought with great success against the Philistines, Moabites, Ammonites, Edomites, and Amalekites, and governed well in the earlier part of his reign, but afterward became possessed of "an evil spirit from the Lord," committed great cruelties, and fell, together with three of his sons, in the battles of Mt. Gilboa against the Philistines, about 1055 B. C. The history of the latter part of Saul's reign is simply a part of the history of David. For further details concerning Saul, see the articles DAVID and JEWS.

**Sauley**, sô'see', LOUIS FÉLICIEN JOSEPH CAIGNART, de: numismatist and Hebraist; b. at Lille, France, Mar. 19, 1807; studied at the École Polytechnique; was appointed Professor of Mechanics at the military school of Metz in 1838, and shortly after keeper of the museum of artillery; gained celebrity first as a numismatist by his *Essai de Classification des Suites monétaires byzantines* (1836); studied Assyrian and Celtic inscriptions, and wrote *Les Campagnes de Jules César dans les Gaules* (1860), but devoted himself more especially to Hebrew antiquities; visited the Holy Land in 1850, and wrote *Voyage autour de la Mer morte et dans les Terres bibliques* (2 vols., 1852-54); *Études sur la Numismatique judaïque* and *Histoire de l'Art judaïque* (1858); *Voy-*

*age en Terre-Sainte* (1865); *Les Derniers Jours de Jérusalem* (1866); *Histoire d'Hérode* (1867); *Étude chronologique des Livres d'Esdras et de Néhémie* (1868); and *Sept Siècles de l'Histoire judaïque* (1874). D. in Paris, Nov. 4, 1880.

**Saulsbury**, WILLARD: U. S. Senator; b. in Kent co., Del., June 2, 1820; educated at Delaware and Dickinson Colleges; was admitted to the bar 1845; was attorney-general of Delaware 1850-55, and U. S. Senator 1859 to 1871, when he was succeeded by his brother ELI (b. Dec. 29, 1817, who was re-elected for third term Jan. 16, 1883. In 1874 Willard Saulsbury was appointed chancellor of Delaware. D. at Dover, Apr. 6, 1892. Another brother, GOVE, was Governor of Delaware 1865-71.

**Sault Sainte Marie**, soo'sant-mā'reé, Fr. pron. sô sâit-mā'ree: village; port of entry; district of Algoma, East Ontario, Canada; on the St. Mary river, the St. Mary Falls Ship-canal, and the Canadian Pac. Railway; opposite the city of the same name in Michigan; 622 miles W. of Montreal (see map of Ontario, ref. 6-H). It has a water-power canal, electric-light plant, a pulp and paper mill operated by water-power (cost over \$1,000,000), branches of the Imperial Bank of Canada and the Canadian Bank of Commerce, schools for Indian boys and girls, and two weekly newspapers. The village is in an agricultural and mineral region, is a popular summer resort, and is the seat of the Anglican Bishop of Algoma and of the Roman Catholic Bishop of Northern Canada. Pop. (1891) 2,414. CHASE S. OSBORN.

**Sault Sainte Marie**: city; capital of Chippewa co., Mich.; on the St. Mary river, near the outlet of Lake Superior, the ship-canal around the rapids, and the Duluth, St. Shore and Atlantic, and the Minneapolis, St. P. and St. Marie railways (for location, see map of Michigan, ref. 2-B). It is connected with a village of the same name on the Canadian side by an international railway bridge, 1½ miles long, which cost \$1,000,000. Navigation between Lakes Superior and Huron is facilitated by a lock and canal, which cost about \$1,000,000. The U. S. Government is building a second lock, which will be the largest in the world, and will cost with improved approaches \$5,000,000. The annual tonnage passing through the canal is greater than that of the Suez Canal. The city has direct connection by the bridge with the Canadian Pacific railways. There are 6 churches, 6 public-school buildings, public-school property valued at \$75,000, parochial-school property valued at \$8,000, 2 national banks with combined capital of \$130,000, a State bank (savings) with capital of \$50,000, a building and loan association, a monthly and 2 weekly periodicals, water and sewer plants, electric lights and street-railways, and an assessed valuation of \$1,600,000. The industrial establishments include 23 sawmills, 2 cigar-factories, 2 brick-yards, 2 machine-shops, foundry, flour, shingle, and planing mills, shipyard and marine railway, and a branch of the State fish hatchery. Pop. (1880) 1,947; (1890) 5,764; (1894) 7,185.

CHASE S. OSBORN, EDITOR OF "NEWS."

**Saumaise**: See SALMASIUS.

**Saumur**, sô'mûr': town of France, department of Maine-et-Loire; on the Loire; 80 miles S. E. of Angers; is famous for its rosaries made of coconut-shells, has manufactures of linens and cambrics, and trades in wine, corn, hemp, and spirits (see map of France, ref. 5-D). It was the seat of the celebrated Protestant academy founded in 1598 by the national synod of Montpellier, and suppressed by a royal edict of Jan. 8, 1685. That academy developed the first French school of criticism in modern theology. Pop. (1891) 12,825.

**Saunders**: See SANTAL-WOOD.

**Saunders**, FREDERICK: author; b. in London, Aug. 14, 1807; established himself in the publishing business in New York in 1836, and subsequently was for some time an assistant editor of the New York *Evening Post*. In 1851 he received the appointment of assistant librarian of the Astor Library, which office he continued to hold until the beginning of 1876, when he was made chief librarian and acting superintendent. He has published *Memories of the Great Metropolis* (1852); *Salad for the Solitary* (1854); *Salad for the Social* (1856); *Pearls of Thought and Mosaic* (1858); *Festival of Song* (1865); *About Woman*, Love and Marriage (1868); *Evenings with the Sacred Poets* (1871); a revised and illustrated edition of *Salad for the Solitary and the Social* (1872; new ed. 1883); *The Story of some Famous Books* (1887); and *The Story of the Discovery of the New World by Columbus* (1892).

Revised by H. A. BEERS.

Earl Rivers, alleging that he was born in London, Jan. 10, 1698; was reared in poverty. He obtained a tolerable education in a grammar school at St. Albans, and was afterward apprenticed to a shoemaker; but having displayed literary tastes, he went to London about 1716, where he obtained the patronage of Steele, and of Wilks and Mrs. Oldfield, the actors, and assumed the name of his alleged father. In 1717 he translated from the Spanish a play, *Woman's a Riddle*, which had a run of twelve nights; produced in 1723 a successful tragedy, *Sir Thomas Overbury*; in 1726 a volume of *Miscellaneous Poems and Translations*; in 1728 *The Bastard*, a Poem, which speedily ran through five editions; and in 1729 his best work, *The Wanderer, a Moral Poem*. In 1727 he was condemned to death for killing a man in a tavern brawl, but was pardoned in opposition to the wishes of his alleged mother; was then taken into the house of Lord Tyrconnel, but soon quarreled with his protector; subsisted thereafter upon money subscribed by Pope and his literary circle; obtained from Queen Caroline an annual stipend of £50 in consequence of some verses he had written on her birthday; resided several years at Bristol, where he was thrown into prison for debt Jan., 1743. D. there Aug. 1, 1743. He is now best remembered by the pathetic *Life* written by his friend Johnson. For an exposure of the improbability of Savage's story, see W. Moy Thomas in *Notes and Queries* (1858). Revised by H. A. BEERS.

**Savanilla:** See SABANILLA.

**Savan'na** [from Span. *sábana*, large cloth, sheet, savanna (in this sense also *sabana*, with accent on second syllable) < Lat. *sa'bānum* = Gr. *sabāvor*, linen cloth, towel]: a grassy plain in a tropical region, yielding pasturage in the wet season, and often having a growth of under-shrubs. It corresponds to the prairie of more northern latitudes. The word is chiefly used in tropical America.

**Savanna:** city; Carroll co., Ill.; on the Mississippi river, and the Chi., Mil. and St. P., and the Burlington Route railways; 10 miles W. of Mt. Carroll, the county-seat (for location, see map of Illinois, ref. 2-D). It is an important shipping-point, and has several manufactories, a State bank with capital of \$50,000, and two weekly newspapers. Pop. (1880) 1,000; (1890) 3,097.

**Savan'nah:** city (originally Yamacraw Bluff); port of entry; capital of Chatham co., Ga.; on the Savannah river, and the Cent. of Ga., the Fla. Cent. and Pen., and the Sav., Fla. and West. railways; 18 miles above the mouth of the river, 115 miles S. W. of Charleston (for location, see map of Georgia, ref. 5-K). It has an excellent landlocked harbor, which has been improved by the U. S. Government since the war of 1861-65, with 23½ feet of water between the city and the bar. The city is partly built on a bluff 40 feet above the level of the river, has an area of 6 sq. miles, was laid out on a plan original with the founder, and is adorned with a large variety of ornamental trees and shrubbery. Since 1884 the city has been drained thoroughly and provided with an improved system of sewerage and twenty-five artesian wells, the latter having a total capacity of over 6,500,000 gal. per day.

**Streets and Buildings.**—The streets are laid out at right angles to each other, are lighted by electricity, and have over 25 miles of electric railway. There are many fine shell-road avenues leading to places of interest in the suburbs. The principal wholesale houses are on Bay Street; the chief shopping thoroughfares are Congress and Broughton Streets; and the fashionable promenade is Bull Street to Forsyth Park and the Parade-ground. Among the notable public buildings are the city-hall, court-house, U. S. Government building, the Oglethorpe Club-house, formerly the Masonic Hall, in which the ordinance of secession was adopted; the Telfair Academy of Arts, containing valuable collections of paintings, statuary, casts, and other works of art; Hodgson Hall, in which are the library and collections of the Georgia Historical Society; the Commercial Club-house; and the Independent Presbyterian Church, considered one of the handsomest church edifices in the South.

**Parks and Resorts.**—Savannah has 34 public parks and squares, with a total area of 65 acres. The largest is Forsyth Park, 10 acres, which is noted for its beautiful fountain and trees. Adjoining it is the Parade-ground, 20 acres, which contains a Confederate memorial monument. Johnson Square contains a monument to Gen. Nathanael Greene; Madison Square, one to Sergt. Jasper; and Monterey Square, one to Count Pulaski. The favorite seaside resorts are the Tybee island beach, at the mouth of the river; Thunderbolt, on

Thunderbolt river; White Bluff, 9 miles W. of the city, and reached by a fine shell road; the Isle of Hope and Beaulieu, on the Skidaway river. The Sea Islands are also much frequented. Bonaventura, 4 miles S. of the city, one of four cemeteries, is widely known for its avenues of ancient live-oaks, whose branches are covered with long, waving gray or Spanish moss.

**Churches, Schools, etc.**—The city is the seat of a Roman Catholic bishopric and contains 41 churches of various denominations. On the site of Christ Church, the oldest Protestant Episcopal edifice, John Wesley established the first Sunday-school in America. The city has a school population of over 10,000, a public high school, 9 public-school buildings, public-school property valued at over \$300,000, a private secondary school for boys, and Savannah Academy (non-sectarian, chartered in 1864). There are 3 libraries containing over 25,000 volumes; 14 charitable institutions; 19 social and literary clubs; 3 free dispensaries; 5 hotels; and 2 daily, 7 weekly, and 2 monthly periodicals.

**Finances and Banking.**—In 1898 the city had a net debt of \$3,494,450, and an aggregate assessed valuation of \$33,424,663. In 1895 there were 2 national banks with combined capital of \$800,000, 6 State banks with capital of \$2,250,000, a safe and trust company with capital of \$125,000, a private bank, and 16 loan companies.

**Business Interests.**—Savannah is the third largest cotton-shipping port in the U. S. Besides cotton it exports large quantities of rice, lumber, and naval stores, and ships vegetables and melons to Northern cities. In the fiscal year 1893-94 its exports of domestic merchandise aggregated a value \$25,527,468, and its imports of foreign goods \$312,948. The principal industries are the manufacture of fertilizers, rice cleaning and polishing, and foundry and machine-shop work. In 1890 the city had 187 manufacturing establishments, representing 42 industries, with combined capital of \$2,977,450, employing 1,643 persons, paying \$42,766 for wages and \$2,597,652 for materials, and turning out articles valued at \$4,467,688.

**History.**—The city was settled by Gen. JAMES EDWARD OGLETHORPE (q. v.) in 1733; repulsed a British attack in 1776; was captured by the British in Dec., 1779, and was held by them to the close of the war. It received a city charter in 1789. In 1796 and 1820 it suffered severely by fire. At the beginning of the war of 1861-65 the forts in the harbor were seized by the State authorities, and during the war the city was a Confederate military post. Gen. Sherman invested the city on Dec. 10, 1864, the Confederates abandoned it, and the Union army took possession on Dec. 21. Pop. (1880) 30,709; (1890) 43,189; (1895) estimated, 62,107.

THOMAS M. NORWOOD.

**Savannah:** town; capital of Andrew co., Mo.; on the Chi., Gt. West. and the Burlington Route railways; 2 miles W. of the One Hundred and Two river; 14 miles N. E. of St. Joseph (for location, see map of Missouri, ref. 2-D). It is in an agricultural, fruit-growing, and stock-raising region and contains 8 churches, a graded public school with high school department, 2 State banks with combined capital of \$44,340, 4 newspapers, a large flour-mill, and a creamery. Pop. (1880) 1,206; (1890) 1,288; (1895) estimated, 1,500.

EDITOR OF "REPUBLICAN."

**Savannah River:** a stream which forms the boundary line between Georgia and South Carolina. From its source to its mouth on Tybee roads its channel is 450 miles long, while the distance in a direct line is only 250 miles. With its tributaries it drains an area of over 8,000 sq. miles. The Savannah is a turbid stream, and the current in the upper portion of the river and its tributaries is rapid and carries a great deal of silt, particularly during the seasons of freshets. Bars are therefore formed in the broader portions of the river where the current is less rapid. At Savannah the mean rise and fall of tide is 6½ feet. The tidal wave ordinarily ascends to a point about 28 miles above Savannah or 45 miles from Tybee roads. The river is navigable to Savannah for vessels drawing 22 feet of water, and by small vessels to Augusta, 231 miles. Under appropriations of Congress improvements in the river and harbor of Savannah (1895) in progress, having in view the securing of a 26-foot channel to Savannah.

**Savary,** *sā'vā'ree'*, ANNE JEAN MARIE RENÉ, Duke of Ravigo; general; b. at Marq, department of Ardennes, France, Apr. 26, 1774; entered the army in 1790; served on the Rhine and in Egypt; was raised to the rank of colonel after the battle of Marengo, and in 1803 became general of brigade.

ive provisions will be seen in the fact that in the years from 1817 to 1872 the interest paid by the Government to savings-banks exceeded that which it had received from investments on their account by the sum of £4,169,427 10s. 5d. As an incentive to industry and economy, and a check to pauperism, the Government could afford to bestow this bounty upon savings-banks, but only upon terms that would tend to exclude from any considerable share in it the opulent classes, whom the liberal interest allowed and the security afforded by savings-banks would naturally attract. Trustees in England are made liable only for their own personal malfeasance, but in Ireland they are made liable for losses, unless by their rules they limit their liability to a fixed sum, which is not to be less than £100. The Government has never conceded its liability to make good the losses sustained by savings-banks, though in one instance of exceptional hardship Parliament appropriated £30,000 as a partial restitution to depositors.

The following table gives the number of depositors and the balance to the credit of savings-banks, including interest, on the books of the national debt commissioners in quinquennial periods from 1817 to 1882. The year 1861 is also included, as marking the highest limit reached by savings-banks before their decadence. This began under competition with the post-office savings-banks, from which, however, the savings-banks afterward recovered:

| Year ending Nov. 30. | Number of depositors. | Amount to credit of savings-banks. | Year ending Nov. 30. | Number of depositors. | Amount to credit of savings-banks. |
|----------------------|-----------------------|------------------------------------|----------------------|-----------------------|------------------------------------|
| 1817.....            | * 9,291               | £231,028                           | 1857.....            | 1,366,560             | £35,255,722                        |

Since 1887 the deposits of trustee savings-banks have been decreasing, while those of the post-office savings-banks have been rapidly growing.

**Post-office Savings-banks.**—In 1861 a system of post-office savings-banks was established, which, however, was little more than an expansion and adaptation to existing conditions of the scheme of Patrick Colquhoun, made prominent by Whitbread in 1807. No arbitrary interference with the existing system of savings-banks was attempted, but these were left to hold their own in competition with the new system as best they could. The practical operation of the latter may be briefly stated: Certain post-offices throughout the United Kingdom are designated at which sums of not less than one shilling or some multiple thereof will be received for transmission to the central office in London. Not exceeding £30 in one year, or £150 in all, or £200 including interest, is received from any one person. The depositor receives a book in which his deposits are entered, and a receipt for each deposit is also forwarded to him in due course from the central office. The moneys are invested in the public funds, and deposits of not less than £1 or multiples thereof receive interest at the rate of 2½ per cent. per annum. The Government is responsible for the repayment of all moneys received, thus affording to depositors perfect security. A depositor may apply at any post-office savings-bank in the kingdom for the purpose of withdrawing money, and may direct payment of the same to be made to him at that or at any other post-office savings-bank. His order is forwarded to the Postmaster-General, by whom a warrant for the designated amount is drawn upon the postmaster where payment is to be made, which is forwarded to the depositor, who presents the same, together with his book, and receives his money.

The system was inaugurated by opening in England and Wales 301 postal savings-banks, which number was increased before the close of the year to 1,629. The system was extended in the following year to Ireland and Scotland. In 1866 the number of postal savings-banks in the United Kingdom was 3,369, or more than five times the highest number under the old system; on Mar. 31, 1882, the number was 6,645, and on Mar. 31, 1891, it was 10,063. In the ten years from Sept., 1861, to Sept., 1871, there had been deposited, including interest, £44,198,743, withdrawn £28,044,539, leaving due depositors £16,154,204. During the calendar year 1881 there was deposited £11,345,957; interest

credited, £826,990; withdrawn, £9,469,668; balance due depositors Dec. 31, £36,194,495. In 1892 the number of postal savings-banks was 10,519, the amount deposited was £21,384,903, and the total amount due depositors £75,853,079.

Penny savings-banks, military savings-banks, and savings-banks for seamen have been established as auxiliaries of the general system, for the purpose of meeting the special needs of classes for which the ordinary savings-banks did not hold out adequate inducements or facilities. The penny savings-banks have commonly been tributary to the larger institutions, making them the depositories of their aggregate accumulations. The military and seamen's savings-banks have been conducted independently. Their statistics are unimportant, and fail to exhibit any distinctive features concerning the thrift of the classes they represent, for large numbers of these prefer to deposit in the regular institutions.

**Savings-banks in the U. S.**—Shortly after the successful inauguration of savings-banks in Great Britain upon a popular and practical plan these institutions began to attract attention in the U. S. The first organization of which there is record was effected in the city of New York, Nov. 29, 1816. The first to go into practical operation was in Philadelphia, which as a purely voluntary association began to receive deposits Dec. 2, 1816, which would indicate an organization effected prior to that in New York. The first to become incorporated was in Boston, Dec. 13, 1816, and it organized and began business in the spring of 1817. Thus the U. S. anticipated Great Britain in giving to this interest the sanction and protection of law. The savings-bank of Salem, Mass., was next incorporated Jan., 1818, and commenced business in April following. The savings-bank of Baltimore opened as a voluntary association for receiving deposits on Mar. 16, 1818, and was duly incorporated in December of that year. The example of these cities and towns was rapidly followed by others.

**The plan of organization of savings-banks** is not altogether uniform. In some States there is a large body of corporators, empowered to enlarge their number indefinitely, who elect from their number annually a board of trustees or directors, to whom the management of the institution is committed. In others the corporators are a defined and limited number, who are themselves the trustees and responsible for the management. These are commonly empowered to fill vacancies that occur, though in some cases this is done by designated authority outside of the board. In the Northeast savings-banks are managed by trustees for the depositors; in other parts they are frequently managed by corporations with capital stock.

AGGREGATE SAVINGS-DEPOSITS OF SAVINGS-BANKS, WITH THE NUMBER OF DEPOSITORS AND THE AVERAGE AMOUNT DUE TO EACH BY STATES, TERRITORIES, AND GEOGRAPHICAL DIVISIONS IN 1893-94.

[illegible]

Legislation of the U. S. has followed the English precedent of imposing restrictions upon the amount which might be deposited by one person in any savings bank, but the English saved much such restriction for use in England, where it was expected. To this may be attributed the fact that the effect has not been attended by marked success, the Americans having seldom regarded these restrictions as such, and they were almost a desperate remedy, or to defy the law by some means. The only really effective restriction is that imposed by those savings-banks which refuse to take of their own force permission to deal only with small individual accounts, but with every savings-bank in the country open to any depositor the restriction, however small, if rigidly enforced, would be the occasion of its restriction of business.

One important feature of savings-banks was that their earnings after paying expenses, were to be ratably divided among the depositors. No day was afterward so commemorated in the country, much more for the purpose of meeting the question which may be asked, thus forming a surplus in the productive industry. In later years a practice has grown up, however, to pay a given rate of interest. This is a departure from the saving-bank principle. The depositors have fallen upon savings-banks and its nearly every income, and of the attempt to fulfill promises concerning the interest, subject to such general restrictions as the law requires, and a savings-bank regulates the dividend or the interest, according to its own discretion. In the case of savings-banks, 4 per cent. was a common rate, and frequently more in three or five years. Depositors of one kind for many years after, 4 per cent. was the saving rate. Two banks that followed and the same course of interest on good securities have led to the payment of 4 per cent. 4 per cent.

The savings-bank system of Canada is largely under government management. The statistics of the past office and Government savings banks of the Dominion for last are as follows: Deposits, \$9,746,976; interest, \$1,466,476; withdrawals, \$12,709,949; balance, \$6,499,460. Besides these there are a few private savings banks and a number of ordinary banks, which perform in a considerable degree the savings-bank functions.

The key rate bank system of France dates from 1814, but was first regulated by law in 1826. At the closed 1931 loan market of deposits was 3,345,000 francs and the amount of deposits 1,042,000,000 francs. In this period savings banks at the same time the number of deposits was 1,510,000 and the amount of deposits 1,000,000,000 francs. In 1932, the amount of deposits 1,215,000 and the aggregate deposits 1,047,000,000 francs. The system of savings banks is tightly connected in Austria, Italy, Switzerland, Germany, and some parts of Germany. A recent official estimate gives the following figures:

| Chemical Function | Percentage of<br>Approximate | Amount in %<br>Approximate |
|-------------------|------------------------------|----------------------------|
| Aliphatic         | 1,250,000                    | 21.0                       |
| Aromatic          | 1,570,000                    | 26.0                       |
| Aliphatic         | 1,570,000                    | 26.0                       |

EMERSON W. KETCH, BOSTON; DR. A. T. HADGEE,

## Savage on Government of Indians. 2. SAVAGE.

**Savo'n'na** (anc. *Saturnia*): Town and seaport of Italy, province of Viterbo, 26 miles by rail S. by W. of Genoa (see map of Italy, ref. 4-B). It has a large island and maritime trade, extensive manufactures (textiles, furniture and ship-building interests). The old temples of *Saturnia* are well-preserved. *Savo'n'na* of ancient origin. Its medieval history is intimately connected with that of Genoa. Pop., including suburbs, 30,000.

**Satornaro'la**, (Giovanni Maria Satornaro) reformer in Ferrara, Italy, Sept. 21, 1462. He was intended for the ministry and his early studies were directed accordingly. Before the age of twenty he had become so charmed by the class of the brilliant court of Ferrara, and by the degraded state of morals and religion, around him, that he resolved to retire to a monastery; but was not for his father's wishes and soon for his mother declared his purpose for some years. In 1475, however, he entered the Dominican convent in Bologna, where he passed seven years. He was then sent to preach in Florence, where Lorenzo de' Medici was at the height of his power, but his first appearance as a preacher was a failure. He went elsewhere and in 1480 he returned to Florence, and was successful. His reputation as a popular preacher rose rapidly, and he was soon listened to with admiration by many of the greatest men of that great age, such as Michelangelo, Buonarroti, Pico della Mirandola, etc., as well as by the thousands of humble citizens who thronged the churches where he preached. In 1491 he was elected prior of San Marco, and at the same time he refused the largest sum to his convent by Lorenzo, who had hoped to buy his silence. His remarks, poured upon at the banquet and the banquet wretchedness, roused a deadly hostility against him. He asserted both the right and the obligation of the Christian teacher to instruct his hearers in their duty as well as other duties, and his bold exercise of this right drew upon him the vengeance of all sort of Lorenzo. In his last hours, however, the offended prince turned to him for consolation, and in 1492 an interview took place between Fra Giovanni and the dying Lorenzo, when, it is said, the priest refused to grant absolution. Nor was the heroic reformer more indulgent to tyranny and sin in the Church than in the state. He had not the most scathing denunciations against the shameful corruption then scarcely less common in the higher ecclesiastical than in the pope, Alexander VI. With the prophet's "Thus saith the Lord," he threatened Church and state with the speedy vengeance of heaven if they did not repent. His followers in Florence known as *Verugiani* (the weavers) because of their penitents multiplied, he pressed to reform more vigorously. his enemies the *Arrabbiati* (the enraged) grew bolder and fiercer. The pope threatened a world's end but was offered an conditional one he was not to be moved. In 1495 he was summoned to Rome, but, knowing what awaited him there, evaded the summons. Finally an order from the Vatican forbade him to preach. He submitted at first, then disclaimed, declaring himself still

able to resist the prophetic spirit which compelled him to speak his Master's words. The sentence of excommunication followed (1497). The *Arrabbiati* got possession of Florence. Fra Girolamo's letters to foreign sovereigns, urging them to call a council to dethrone the Borgia and elect a new pope, fell into the hands of his enemies. On Apr. 7, 1498, occurred the famous attempt at a "trial by fire," to decide whether he was divinely commissioned, but its fiasco turned the people against him, and on the night of the following day the convent of San Marco was attacked by an infuriated mob. The signoria sent thither officers to demand the surrender of the prior, who, with two of his brethren, was conveyed to the dungeons of the Bargello, and brutally tortured the same night. These barbarities were continued for weeks, and suspended only when the life of their victim was in danger. In the delirium of agony Savonarola sometimes gave confused answers as to his prophetic gifts, but no confession of guilt could be extorted from him. His destruction, however, was inevitable. The pope threatened Florence with an interdict and with every other form of vengeance if she spared the hated friar. Sentence of death was pronounced on May 22, 1498, and the next day he and his two friends and fellow monks Domenico and Silvestro were publicly hanged and then burned in the Piazza della Signoria and their ashes thrown into the Arno. The judgment of history has acquitted Savonarola of the charges brought against him in his own day, and the sincerity of his faith and the disinterestedness of his aims are as unquestioned as the purity of his life and the power of his intellect. Even the Roman Catholic Church, through Popes Paul V. and Benedict XIV., has declared his works irreproachable, and placed him among the servants of God. In the convent of San Marco are preserved various objects of interest once belonging to the martyred prior, such as his Bible filled with annotations by his own hand, etc., and a portrait, probably by his friend Fra Bartolommeo. He was of middle stature, dark complexion, plain in feature, pallid and worn with abstinence; his expression severely noble, but benevolent, and when animated his keen dark eyes glowed like flames. It is incorrect to speak of him as "a reformer before the Reformation," for he had no thought of leaving or opposing the Church. Yet his insistence upon the Bible as the surest guide to the knowledge of spiritual things, and his protests against the corruptions of the Church, had unquestionable influence in hastening the Reformation which followed so shortly after. Among the many works of Savonarola the best known is his *Triumphus Crucis de Veritate Fidei* (Florence, 1497; Eng. trans. *Triumph of the Cross*, London, 1868; also translated *Sorrow and Hope: Meditation on the 31st Psalm, written in Prison*, 1894). The principal *Life of Savonarola* is by Prof. Pasquale Villari (2 vols. 8vo, Florence, 1860; translated into English by Horner, London, 1863; 2d ed. 1888), with full references to authorities and a list of Fra Girolamo's works, both published and unpublished; see also W. R. Clark's *Life and Times of Savonarola* (1878).

Revised by S. M. JACKSON.

**Savory:** popular name of the *Satureja hortensis* (summer savory) and of the *Satureja montana* (winter savory), labiate garden-herbs of Old World origin, employed in domestic cookery for their flavor.

**Savoy:** formerly a political division of the kingdom of Sardinia, and originally the family possession of the dynasty now reigning in Italy. In 1860 it was ceded to France, and it is divided into the two departments of Savoie and Haute-Savoie. Savoy is the loftiest mountain region of Europe, containing the highest peak, Mont Blanc. Bounded N. by the lake of Geneva and E. by Piedmont, it is covered by the Graian Alps, and entirely broken up into mountains and valleys. It contains very little arable land, but that which it contains is most carefully cultivated, planted with vines and mulberry-trees, and generally produces wheat enough for home consumption. The mineral wealth of Savoy is not great, though coal, lead, iron, etc., are found, and to some extent worked. But the pastures which cover the mountains are very important, and feed large herds of cattle and sheep; dairy-farming is the principal occupation. The area of the two departments is—Savoie, 2,224 sq. miles, with (1891) 263,297 inhabitants; Haute-Savoie, 1,667 sq. miles, with (1891) 268,267 inhabitants. The Savoyards are an honest, industrious, intelligent, and hospitable race, deeply attached to their native country. They emigrate in large numbers, but when they have amassed enough wealth they return to live in their fatherland.

**Savoy Conference:** a conference between Episcopalians and Presbyterians held in London soon after the Restoration. The Episcopalians were determined to restore the Church of England to what it was before the civil war, but the Presbyterians, who mainly had been in possession of church benefices and church power for many years, contended for some modification of the former system. A royal commission was issued on Mar. 25, 1661, appointing certain Church of England and Presbyterian divines to confer together, and gave them authority to review the Book of Common Prayer, to compare it with ancient liturgies, to consult respecting exceptions made to it, and by agreement to make alterations such as would satisfy tender consciences and restore unity to the Church. The instrument appointed "the master's lodgings in the Savoy," London, as the place of meeting. As the terms of the commission specified advice and consultation as purposes of the meeting, friendly conference seemed necessary; but the Episcopal party manifested no disposition for anything of that kind. They required written communications from their opponents stating their exceptions to the Liturgy, and to them gave answers both uncourteous and captious, not indicating any disposition to conciliate, but foreclosing the possibility of removing Presbyterian objections. They said: The alterations asked, if allowed, would be a virtual confession that the Liturgy was an intolerable burden, a cause of schism, and would justify past nonconformity. Taking such ground, it mattered not what the objections made might be—none was admissible; and therefore to advise and consult was a thing out of the question. It had been arranged that, while the rest of the Presbyterian brethren employed themselves in drawing up exceptions against the Book of Common Prayer, Baxter should prepare additions. In one fortnight he accomplished his task and presented his reformed Liturgy. The author tells us that he compared what he did with the Assembly's Directory, the Book of Common Prayer, and Hammond's *l'Estrange*; but he seems to have borrowed little or nothing from these sources, beyond introducing or allowing the use of the creeds—sometimes the use of the Athanasian Creed—the *Te Deum*, and the Psalms in order for the day. A rejoinder to the bishops' answers touching exceptions made to the Liturgy followed on the part of the ministers, but no effect was produced by it. At last it was settled that there should be a formal debate, to be conducted by three persons on each side. Strangers were allowed to be present, and the room was full of auditors, young Tillotson, the eminent preacher and archbishop of later days, being among them. The debate turned upon vague abstractions and upon subtle theological distinctions, occasionally interrupted by outbursts of temper and uncivil personalities. As might be expected, the hall of the Savoy Palace became an arena for logical gladiatorship, the object of the meeting was a strife for victory, and the end of the conference was hopeless disagreement. Baxter's *Reformed Liturgy* was reprinted, edited by Charles W. Shields, under the title *The Book of Common Prayer as Amended by the Presbyterian Divines of 1661* (Philadelphia, 1864; 2d ed. New York, 1883).

Revised by S. M. JACKSON.

**Savoy Declaration:** an ecclesiastical document, deriving its name from the Savoy Hospital in London, where it was framed. Before the death of Oliver Cromwell a meeting was convened by notice from the clerk of the council of state, addressed to the Congregational elders resident in London. Cromwell, though not favorable to the proceeding, yet permitted it; but the ministers did not meet until after his decease; then they assembled in the Savoy Sept. 29, 1658, to declare the principles of their faith and polity. The business was disliked by people about the court, who feared it might lead to fresh divisions between the Independents and Presbyterians. There might be political intrigues at the background of the movement, for Cromwell said in reference to some of its projectors, who were republican officers, "They must be satisfied, or we shall all run back into blood again." At all events, when the meeting came to be held nothing was done which the Protector would have disapproved. The Declaration did not clash with the sentiments of broad charity so dear to his heart. As to doctrine, the Declaration is substantially the same as the Westminster Confession. Its speciality consists in its outline of ecclesiastical order. Whereas the covenants or mutual agreements into which Congregationalists had entered at the formation of their churches in the time of the civil wars generally contained some references

same gate, and then the entire log could be cut into boards by a single traverse of the carriage.

In the more recent gang-saw mills there are two gates, in one of which there are but two saws, through which the log is first passed and made parallel-sided; it is then turned upon one of these sides and passed through the second gate, in which there is a sufficient number of saws to cut the log into the desired thickness of boards or planks.

Circular saws, driven by steam or water power, have been largely used for the manufacture of lumber, especially in the U. S., where their use for that purpose originated in a patent granted on Mar. 16, 1820, to Robert Eastman and J. Jaquith, of Brunswick, Me. Multitudes of other patents for circular-saw mills have been granted, covering more or less valuable improvements, but this form of mill remains a very wasteful means of converting timber into lumber.

The band-saw has been adapted to the sawing of logs, and is used to a large extent on the Pacific coast of the U. S. for utilizing the large timber of that region; this form of saw is less wasteful and works rapidly.

W. F. DUFFEE.

**Sawyer, LEICESTER AMBROSE:** biblical scholar; b. at Pinckney, N. Y., July 28, 1807; graduated at Hamilton College, Clinton, N. Y., 1828; studied theology; was ordained as a Presbyterian minister in 1832, and from 1840 to 1847 was teacher in Central College, Ohio, after which he preached in several places; subsequently was editorially connected with the *Utica Morning Herald*. Author of *Elements of Biblical Interpretation* (New Haven, 1836); *Mental Philosophy* (1839); *Moral Philosophy* (1845); *A Critical Exposition of Baptism* (Cincinnati, 1845); *Organic Christianity, or the Church of God* (1854); and *The Reconstruction of Biblical Theories, or Biblical Science Improved* (1862). In 1838 he began a new translation of the entire Bible, which he completed about 1862. The New Testament was published at Boston, Oct., 1858. The prophetic books of the Old Testament were issued Dec., 1860, and the book of Daniel, with the apocryphal additions, was separately issued in 1864. The remaining (earlier) portions of the Old Testament were not published.

Revised by W. H. WHITSITT.

**Sawyer, PHILETUS:** U. S. Senator; b. at Whiting, Vt., Sept. 22, 1816; went to Wisconsin 1847; engaged in the lumber business at Oshkosh on an extensive scale; was a member of the Legislature 1857 and 1861; mayor of Oshkosh 1863-64; was a delegate to the Loyalists' convention 1866, and sat in Congress as a Republican from 1865 to 1875, when he declined a re-election. He served on several important committees connected with the business interests of the Northwest, and became chairman of the committee on Pacific railways. He was U. S. Senator from Wisconsin 1881-93.

**Sawyer, THOMAS JEFFERSON, D. D.:** clergyman; b. at Reading, Vt., Jan. 9, 1804; graduated at Middlebury College 1829; was pastor of a Universalist church in New York 1830-45, and again 1852-61, having in the interval been principal of the Liberal Institute at Clinton, Oneida co., N. Y.; taught theology in the same institution; resided on a farm at Clinton 1861-69, after which he became Professor of Theology in Tufts College, Medford, Mass., an institution which he had been instrumental in founding (1852), as he had also been in the establishment of the theological department of the St. Lawrence University (1856). He has defended the doctrines of Universalism in public discussions with clergymen of other denominations, and some of these polemics have been published, the most important being the discussion with Rev. Isaac Westcott, entitled *The Doctrine of Eternal Salvation* (New York, 1854). In opposition to the views of Henry Ward Beecher, he published *Who is our God? the Son or the Father?* (1859).—His wife, CAROLINE M. FISHER, b. at Newton, Mass., Dec. 8, 1812, was married 1832; has written much in prose and verse for periodicals, especially *The Christian Messenger*; published several translations from the French and German, and edited *The Ladies' Repository*, a Universalist monthly magazine. She also published the *Poems of Mrs. Julia H. Scott* (1854), preceded by a *Memoir*.

**Saxe, JOHN GODFREY:** poet and humorist; b. at Highgate, Vt., June 2, 1816; graduated at Middlebury College 1839; was admitted to the bar at St. Albans 1843; practiced law in Franklin County 1843-50; was editor of the *Burlington Sentinel* 1850-56; was State's attorney of Vermont one year, after which he devoted himself chiefly to literature and to popular lecturing; was Democratic candidate for Governor 1859 and 1860. Author of several volumes of humorous poems, the longest of which were delivered at college com-

mencements and other anniversary occasions. His published works include *Progress* (1846); *New Rape of the Lock*; *The Proud Miss McBride*; *The Money King* (1859); *Clever Stories of Many Nations*; *The Masquerade* (1866); and *Leisure Day Rhymes* (1875). More than forty editions of his collected poems have been issued in the U. S. and in England. D. at Albany, N. Y., Mar. 31, 1887.

Revised by H. A. BEERS.

**Saxe, MARSHAL:** the name by which Maurice, Count of Saxony, is generally known. He was born at Goslar, Oct. 28, 1696; a son of Augustus II. the Strong, Elector of Saxony and King of Poland, and Aurora von Königsmark. In his twelfth year he was in the army of Prince Eugene, and in 1711 received formal recognition from his father, who raised him to the rank of count, but his debaucheries and dissipations, in which he surpassed even his father, developed as early and as rapidly as his brilliant talents. He served in a campaign against the Turks in 1717, and two years later went to France, bought a regiment, was appointed *maréchal de camp*, and studied with great energy mathematics, mechanics, and fortification. In 1726 the estates of Courland elected him duke, but, declining the proposed marriage with the duchess, he maintained his ducal authority against her opposition with great difficulty, supporting a small army by means of the money lent him by Adrienne Lecouvreur, the actress. In 1727 he withdrew to Paris. At the outbreak of the Austrian War of Succession he offered his services to his native country, but by the fault of Count Brühl they were not accepted, and he received a French command. He took Prague by storm in 1741, and fought with great distinction in Bohemia, Bavaria, and on the Rhine; but his fame as a great general he gained chiefly by his campaigns in Flanders from 1744 to 1748. He won a brilliant victory at Fontenoy May 11, 1745, and at Raucoux Oct. 11, 1746. He took Brussels, Bergen-op-Zoom, and Maastricht, and conquered the whole of Belgium. The enthusiasm of the French people and king knew no bounds; honors were heaped upon him; he was made marshal-general of all French camps and armies, and presented with the palace and estates of Chambord, where he led a princely life, and died Nov. 30, 1750. His *Réveries*, written in 1731, but afterward revised and much enlarged, is full of ingenious and audacious ideas; his *Lettres et Mémoires*, published in 1794, have also some interest.

Revised by F. M. COLBY.

**Saxe-Altenburg:** a duchy of the German empire; area, 511 sq. miles; pop. (1890) 170,864; budget of 1895, 3,847,119 marks; public debt (July, 1893), 887,450; is situated N. E. of the Thuringian Forest, and consists of two separate parts called the eastern and the western district. Capital, Altenburg. By the division of 1485 the country fell to the Albertine line. In 1553 it was returned to Duke Johann Friedrich the Magnanimous, of the Ernestine line, and was under dukes of its own from 1603 to 1672, when the reigning family became extinct, and it fell to Saxe-Gotha. As the line too became extinct the country fell, according to the convention of Nov. 15, 1826, to the Duke of Saxe-Hildburghausen, who gave up his own country, Hildburghausen, and became Duke of Saxe-Altenburg. His descendants are still reigning.

Revised by M. W. HARRINGTON.

**Saxe-Coburg and Gotha, -gō'tā:** two duchies which together form a constitutional and hereditary monarchy, under the sovereignty of a duke, and an independent member of the German empire; area, 755 sq. miles, of which 217 1/2 miles belong to Coburg and 538 sq. miles to Gotha; separated from each other by the Thuringian Forest—Coburg to the S. and Gotha to the N. Pop. (1890) 206,513. Capitals, Coburg and Gotha. Each duchy has a legislative chamber of its own (Gotha 19 and Coburg 11 deputies). These deputies also form a common diet for the united duchies. Coburg has a budget of 1,233,200 marks, with a debt of 3,213,824 marks; Gotha, a budget of 4,204,150, and a debt of 140,195. There is also a budget of 2,012,182 marks, common to the two duchies. Since the accession of Duke Ernst II. in 1844, the two small duchies have formed the starting-point for much intellectual progress. The union of the two countries dates from 1826. The house of Saxe-Coburg, founded in 1650, became extinct in 1699. The contest concerning the heritage ended in 1720. The Duke of Saxe-Saalfeld received the country. The Dukes of Saxe-Saalfeld-Coburg reigned till 1826, when they ceded Saalfeld to Meiningen, and received Gotha, whose own dynasty had died out. Ernst II. was succeeded in 1893 by his nephew, the Duke of Edinburgh.

Revised by M. W. HARRINGTON.

the particular Saxon Government, which is independent with respect to the interior administration. The reigning king is Albert, who ascended the throne Oct. 29, 1873; the representation of the people is composed of two chambers. The finances are in good order. The budget estimate for each of the years 1892-93 was 97,683,109 marks, with a special revenue and disbursement of 51,405,100 marks, relating to public works. More than half the total revenue is derived from state domains, forests, and railways, the last alone giving, in 1892, a net revenue of 30,597,450 marks. The total debt in 1892 was 625,780,750 marks, nearly all incurred in the acquisition of railways and telegraphs, and the promotion of other works of public utility. The total income of all classes of the population was estimated in 1892 at 1,584,950,632 marks, an increase of 17,000,000 marks over the preceding year. The army forms the Twelfth Corps of the German imperial army. The Saxon colors are green and silver.

**History.**—That German tribe which the Romans called Saxones was in ancient times settled between the Eider, the Elbe, and the Trave. Charlemagne made war upon them 772-804, and subjugated them, and Saxony became a dukedom, belonging to the Frankish and afterward to the German empire. Under Otto the Magnificent, Thuringia was united to it, and Otto's son, Henry, became King of Germany in 919. His successor, the Emperor Otto I., gave the dukedom of Saxony to Hermann Billung. Under the house of the Billungs, Saxony made war upon the Emperor Henry IV. in 1073, but in 1106 the house became extinct, and under the Emperor Lothar, in 1125, the country came into the possession of Duke Henry of Bavaria. His son, Henry the Lion, increased the dukedom, but when he was placed under the imperial ban his dominions were scattered, and, after being reduced to a small piece of land, the dukedom of Saxony was given to Margrave Bernhard of Ascania. The house of Ascania branched off in 1260 into two lines, of which one, the Wittenberg, became extinct in 1422, while the other, the Lauenburg, reigned until 1680. The title of Duke of Saxony followed the Wittenberg branch; it was changed in 1355 to that of elector, and both land and title were bestowed on Frederick the Valiant, Margrave of Meissen, in 1423. Thus the name of Saxony, which originally designated a tribe, became a princely title, and was transferred to countries with which it had no historical connection. Since 1088 the house of Wettin has reigned in the margraviate of Meissen. In 1485 the grandsons of Frederick the Valiant, Ernst, and Albert, divided the inherited countries, so that Ernst received Thuringia, and Albert, Meissen, and two lines were thus formed, which still flourish, the Ernestine and the Albertine, of which the former reigns in the Saxon duchies, the latter in the kingdom of Saxony. After the Peace of Westphalia, in 1648, the rise of Brandenburg became an impediment to the development of the electorate. The Elector Augustus embraced Roman Catholicism in 1697, became King of Poland, and involved Saxony in war with Charles XII. of Sweden. His successor, Augustus, sided with Maria Theresa of Austria against Frederick of Prussia, and in the Seven Years' war Saxony suffered heavy losses. Under Frederick Augustus III. (1763-1827) the country again began to rise, though it had some very hard years also during this period. As a member of the German empire it took part in the war against France, and concluded an alliance with Prussia in 1806, but after the defeat at Jena it concluded an alliance with Napoleon and entered the Confederation of the Rhine, after which the elector received the title of king. By the Peace of Tilsit the King of Saxony obtained the duchy of Warsaw, which had just been established, and portions of Prussia and Austria, but after the battle of Leipzig he was taken prisoner by the allied Russians, Prussians, and Austrians, and at the Congress of Vienna (1815) was deprived of 7,720 sq. miles of territory. In the long period of peace from this moment, and up to 1866, the country became very prosperous, though a narrow and short-sighted policy of government presented many obstacles to its development. The revolutionary years of 1848-49 brought many great and beneficial reforms to Saxony. Aug. 9, 1854, King John ascended the throne, and both he and his minister, Beust, made a most stubborn opposition to the Prussian policy, and showed a decided partiality for Austria as the leader of the small states. The war of 1866 brought the independence of Saxony in imminent danger, and the king, John, saved his crown only by entering the North German confederacy, over which Prussia presided, by paying 30,000,000 marks in

war indemnity, and by dismissing Beust. The liberal party in Saxony hailed this event with enthusiasm, but the party consisting of the court, the nobility, and the army officers continued hostile to Prussia. In 1870-71 the Saxon soldiers fought under the leadership of the crown prince, afterward King Albert, as true allies by the side of the Prussians, and the interior development of the country has not only kept pace with that of the rest of Northern Germany, but in some respects even advanced beyond it. A new modification of its constitution took place Oct. 12, 1874, giving to the lower house of representatives a more democratic character, while the upper house is still strongly aristocratic in its membership. Revised by M. W. HARRINGTON.

**Saxton, JOSEPH**: inventor; b. in Huntingdon co., Pa., Mar. 22, 1799. His mechanical ingenuity was early shown by improvements in the machinery in his father's nail-factory. At the age of eighteen he went to Philadelphia, and there invented a machine for cutting the teeth of chronometer wheels, an original escapement with a compensating pendulum, and made the clock which marks the time from the belfry of Independence Hall. In 1828 he went to London, where he resided for nine years. He was placed as chief assistant in the Adelaide Gallery, then the great scientific repository, and while there constructed a magneto-electric machine by which the first magnetic spark was produced. He also constructed the apparatus used by Wheatstone in his experiments on the velocity of electricity in its passage through a wire. He next invented a locomotive differential pulley, by means of which high speed may be given to vehicles by horses traveling at a slow rate, and a medal-ruling machine for tracing lines on metal or glass, representing by an engraving the design on the face of the medal. He returned to the U. S. to superintend the construction of the machinery and balances for the Philadelphia mint, and subsequently was placed in charge of the construction of the standard weights and measures for the U. S. This position he filled with ability, furnishing the State capitals and the custom-houses with accurate sets of weights and measures. A gold medal was awarded him at the London Exhibition of 1851 for a large class-balance of extreme precision. He was one of the original corporators of the National Academy of Sciences. Among his many ingenious devices and inventions, the mirror-comparator for comparing and the tracing-machine for dividing standard measures, his deep-sea thermometer, used in the exploration of the Gulf Stream by the U. S. Coast Survey, his self-registering tide-gauge, and his immersed hydrometer, deserve especial mention. D. at Washington, D. C., Oct. 26, 1873.

Revised by R. H. THURSTON.

**Saxton, RUFUS**: soldier; b. at Deerfield, Mass., Oct. 19, 1824; graduated at the U. S. Military Academy July 1, 1849, as brevet second lieutenant of artillery; from 1855 to 1859 was on coast-survey duty, and for a year was assistant instructor of artillery tactics at West Point. On the outbreak of the civil war he was stationed at St. Louis, and participated in dispersing the Confederate force at Camp Jackson, May 10, 1861; appointed assistant quartermaster U. S. army May 13, 1861; he served on the staff of Gen. Lyon as chief quartermaster until transferred in July to the staff of Gen. McClellan in West Virginia. In September he accompanied the expedition to Port Royal, S. C.; appointed brigadier-general U. S. volunteers in Apr., 1862, he commanded at Harper's Ferry when threatened by Jackson; assigned to duty as military governor of the department of the South July, 1862, where he was engaged in organizing Negro laborers and troops, and as commissioner of the Freedmen's Bureau until Jan., 1866, when he was mustered out of the volunteer service; brevet major, lieutenant-colonel, colonel, and brigadier-general. In 1872 he became deputy quartermaster-general U. S. army, with rank of lieutenant-colonel; in 1882 assistant quartermaster-general, with rank of colonel; retired Oct. 19, 1888. Revised by JAMES MERCUR.

**Say, JEAN BAPTISTE**: economist; b. in Lyons, France, Jan. 5, 1767; was educated for a commercial career, and spent a part of his youth in England; found employment on his return to Paris on Mirabeau's paper, *Courrier de Provence*, and afterward as secretary to Clavière, Minister of Finance; edited from 1794 to 1800 *La Décade*; became a member of the tribunate in 1799; published his celebrated *Traité d'Economie politique* in 1803, and enjoyed a great reputation when his thorough disagreement with Napoleon's policy compelled him to retire into private life. He established a large spinning-mill, and published in 1815 *Catéchisme*

*Th. sumneri* *gouldii* was used in 1910 in the *Anglais* series of the *Am-  
éricain*. After the fall of Napoleon his name took on a value  
in connection with the well-known professor at the École  
Normale Supérieure in 1810 and at the Collège de France in  
1811. From Paris, Nov. 15, 1816. He was the first writer to  
mention the existence of *Adiantum Smithii* in the *Compendium  
de la flore de France* (Paris, 1816) under the title *Compendium  
de la flore de France*.

July 1868. He married later, according to his Paris June 1870, testimony of June 11. Say, studied political economy, took his active part in publishing the *Journal des sciences*, was appointed justice of the department of the Seine in 1871, and elected a member of the Legislative Assembly. Was Mayor of Paris in 1872, 1873, and 1877. Minister of Education in 1880, and in the same year president of the *Académie*, and published *Théorie des changes monétaires* (London). From the *Revue des sciences* de la ville de Paris, *Les Villes de France* et le *Grand monde*, *Revue des sciences de la ville de Paris*, et de la ville de Paris, etc.

Prof. FISHMAN, biologist, is in Philad. India, Pa., July 27. He was one of the founders, and the first curator, of the Smithsonian Association of Natural Sciences; accompanied James Hutton, and tried in their scientific exploration of the West. From 1868 was recruited to May Long's expedition to the lower Mississippi 1868-70, and to St. Louis, 1871. He published *Evolutionary and Indian Language*, Philadelp., 1877, and his principal work, *American Zoology*, in 4 vols. (Philadelphia, 1874-78), removed to the Library and then to New Harmony, Ind., 1876, as one of the founders of that zoological establishment. He died after the separation of his associates, published 7 volumes of a great work on *American Zoology* (1880-1884), much incorrect plates. D. at New Harmony, Oct. 10, 1884. His complete *Workshop on Zoology* was edited by William C. Cresson, N. Y., 1889, and his *Complete Zoology*, and *Evolutionary* was issued by Lett. and Co. (New York, 1888-1890). He tried to be regarded as the father of the all zoological society. His work, mostly on invertebrates, was of the highest character.

Revised by J. S. KENNEDY.

Joseph A. Brinkman, M.D., F.R.S., physiologist; b. at Shrewsbury, England, Sept. 23, 1860; graduated at Oxford in 1882; became lecturer in biology of Queen's College; was appointed Lecturer in Physiology of comparative Physiology at Oxford in 1890, which office he resigned in 1898. He has worked in the physiology of Bacteria, Ascomycetes, Tubercle, Malaria, Syphilis, etc., and has published a number of books and papers. Amongst them are: *Introduction to the Science of Immunology*, 1900; *The Ancient Empires of the East*, 1901; *The Malaria Infection* for 1902; and the religious of the ancient India, *Indo-European*, and *The Records of the Past*, 1903. 6 vols. 1898-1904. D.D. L.VIII.

10-11-1944.

Dr. David Green, M. D., Surgeon, is a native of Madison, N. J., and in 1870 graduated at the University of Transylvania, Kentucky. He then studied the medical profession, in 1873 he was in the office of Dr. David Green in New York; in 1882 he was in the office of M. D. in the College of Physicians and Surgeons, and appointed resident physician of Bellevue Hospital, New York, in 1886, and soon after was elected Surgeon of Transylvanian Surgery in the Bellevue Hospital, New York. In 1894 he was elected first surgeon for the treatment of suppurative diseases of the joints; and in 1895 he was elected first head of the orthopedic and portion of the orthopedic department. In an operation he has performed more probably than the whole profession together. He has introduced numerous steps in the treatment of hip-joint diseases, and a series of the vertebrae, featuring on these subjects in the United States, and may be said to be the founder of the orthopedic surgery as a specialty. Dr. Green is the author of several monographs on orthopedic surgery. In 1872 he was appointed with a Knight of the Order of St. Louis.

Bound by S. T. A. 1887, 1890

It is a disease of sheep much resembling the itch which occurs in the human species. Like that disease, it is caused by the presence of a minute acarus or spider-like insect, which, according to several authors, tobacco-water, and other remedies are all unavailing, and the disease can only be cured with difficulty. It may be suspected that the sheep may be cured by wash, or have cure and scurfy removed from the whole.

It is a common cause of the popular notion of several diseases, and is a roughening of the surface of the affected

poet. *Apoplexia* is a disease in which the brain becomes diseased and covered with black crab-like spots, varying from mere specks a millimeter in diameter to blotches nearly as large as half an inch in diameter. It is caused by a minute hyaline-shaped fungus.

අනුමතය. - 1. සහ අනුමතයේ අදහස, සං  
කල්පය. 2. සංකල්පය අනුමතය (සංකල්පය  
සහ අනුමතය)

oil) and *Phoma* is a similar affection of the pear, caused by the same or a very closely related fungus known as *P. pearsoni* (Carp. and), or more properly antherisma, occurs upon the leaves, twigs, and berries of the pear, forming brownish or grayish spots with dark margins. It is one of the most destructive of the grape diseases and is caused by a minute multicellular fungus (*Phoma* or *Phoma ampelophila* or, according to de Bary, *Sphaerolium ampelophila*) which attacks the superficial cells of the affected parts. The application of potassium solutions by spraying has been found beneficial. *Anther* is a disease of the tubers of common potatoes in which the surface becomes more or less covered with rough scabby scales, injuring their appearance and value. Careful investigations by Prof. Bailey show that it is caused by bacteria which invade and destroy the outer cells. As a consequence, the tuber develops masses of cork-like cells to close the wounds resulting from the action of the bacteria. Soaking the potatoes before planting for an hour and a half in a solution of corrosive sublimate in water (1 to 1,000) will destroy the bacteria. The planting should be upon ground free from contamination. *Heart* is a disease of sugar-beets similar to the potato-scab, and, as shown by Prof. Bailey, caused by the same species of bacteria. The scabby patches occur upon the upper portion of the beetroot, and greatly disfigure it. It is therefore necessary in growing sugar-beets to avoid the use of fields in which scabby potatoes have been grown. *Wheat scab* is a disease of the heads of wheat in which they turn pale yellow, wholly or in part, the berries shriveling and drying up. The scab also becomes covered over with a sticky growth, which the microscope shows to be a hyphomycetous fungus, probably *Fusarium tritici*. Early sowing upon well-prepared soil tends to diminish this disease. See F. L. Scott's *Fusarium Infection of the Grape* (U. S. Dept. Agr., 1896); *Pseudo-Downy of the Grape and other Plants* (1901); J. C. Arthur, *Wheat Scab* (Bull. Purdue Univ. Exp. Station, 1901); B. L. Bailey, *Potato Scab and Beet Scab* (Bull. N. Dak. Exp. Station, 1901).

CHARLES E. BRADY.

CHARLES E. BRADY.

**Scenthound-fish:** the *Lepidionus oxyrinchus*, a species of the family *Trachuraeidae*, distinguished by the elongated, fish-like body, pointed head, forcibly armed mouth, elongated dorsal and anal, and well-developed and forked caudal fin. The species is an open-sea fish, and rather rare on the coasts of Europe.

**Scabies or Itch** (*scabies* is Med. Lat., from Lat. *scab*, to scratch, massage, itch) is a parasitic disease of the skin. It affects chiefly the hands, more especially the webs of the fingers, their inner surfaces, and the back of the hand. It is frequently extended to the arms, and rarely the feet, legs, and abdomen are affected. The scalp may be involved, but the face is exempt. This disorder infests children, the particular mode being transmitted from parent to person by contact at school or play, and its lodgment being facilitated by neglect to wash perspiration, and dirt from the hands. Persistent and annoying itching is experienced; careful inspection detects small red elevations, points of irritation, papular at first; soon these become vesicular or watery at the tip and often from scratching are scratched papular, and later scaly. Close inspection discloses small red lines connecting these vesicles or branching from them into adjacent healthy skin. These red lines are subcutaneous channels

produced by the burrowing of the itch-insect beneath the cuticle or scurf-skin, and the vesicles are the result of inflammation to which its presence and irritation have given rise. The insect will not be found in the fluid or cavity of the vesicle, but by laying open the diverging canals with a fine needle may often be found at its end. This parasitic insect is known as the *Acarus scabiei*, or *Sarcoptes hominis*. It is a whitish insect, from  $\frac{1}{16}$ th to  $\frac{1}{8}$ th of an inch long. The male is migratory in his habits, and small. His head is provided with two mandibular organs and four palpi or bristles; the adult male has eight legs. The female is sedentary in habits, and more easily found, especially at the ends of channels, where she lays her eggs. The acarus makes its progress beneath the epidermis by means of suckers or disks upon its legs, and by aid of bristles upon its back, directed backward. Hahne-mann ascribed itch to a supposititious cause, a subtle humor, which he termed *psora*, and which he regarded as the cause of multitudinous ailments of all kinds; but the microscope has established the parasitic nature of the disease. The treatment of scabies consists in killing the parasites. Remedies producing this end are termed parasiticides. Chief among these is sulphur, in ointment, powder, or vapor. Sulphurous acid is a convenient application. Carbolic acid, kerosene, petroleum, strong alkalies, and solution of corrosive sublimate are also efficacious. Even when cured as a specific disease, the redness and vesicles may linger, a chronic condition of irritation. Soothing ointments are then indicated.

Revised by W. PEPPER.

**Scad:** the *Trachurus trachurus*, a fish of the family *Carangidae*, distinguished by its elongated, fusiform body, completely plated lateral line, and silvery color. When fresh it is scarcely edible, but it takes salt well, and when pickled is very good. Immense quantities are taken in the British seas. The name has been extended to congeneric species, as well as to species of like form belonging to the genera *Trachurops* and *Decapterus*.

**Scævola**, sev'ô-lă: a cognomen common among the members of the plebeian family of the Mucii in ancient Rome. The two most prominent members of the family were QUINTUS MUCIUS SCÆVOLA, THE AUGUR, and QUINTUS MUCIUS SCÆVOLA, THE PONTIFEX, both celebrated as jurists, and nearly contemporary. The former was tribune of the people in 128 B. C., prætor in 121, consul in 117, and died soon after the outbreak of the war between Marius and Sulla. Cicero, who was born in 106 B. C., states that after assuming the garb of manhood (*toga virilis*) he was taken by his father to Scævola to be instructed in law, and that he remained in close attendance upon him until his death. The Pontifex Scævola was tribune in 106 B. C., and consul in 95. He was proscribed and put to death by the party of Marius in the year 82. Cicero, who, after the death of Scævola the Augur, attached himself to the Pontifex, characterizes him with the epigrammatic phrase that of jurisconsults he was the most eloquent, and of orators the most deeply versed in the law.

Revised by G. L. HENDRICKSON.

**Scagliola**, skāl-yô-lă [from Ital. *scagliuo'la*, liter., dimin. of *scaglia*, scale]: an imitation of marble, made by mixing ground gypsum with glue, coloring it, applying it to the surface to be marbleized, and setting into the soft mass, if it be desired, bits of various ornamental stones. When hard the surface is smoothed and polished. It is an admirable imitation of the more costly marbles, but is not durable, especially in damp places.

**Scala**, skaal'ă (Lat. *Scaligeri*): the name of a celebrated Italian family which reigned in Verona from 1260 to 1387. After a long series of internal disturbances, tyranny alternating with anarchy, Mastino della Scala succeeded in 1260 in making himself master of the city. He ruled with firmness and wisdom; the city prospered, and, although he was assassinated in 1277, the power continued in his family for more than a century. Under Cangrande (1311-29) the fortune of the family culminated. He was confirmed in his possessions, to which were added Vicenza, Padua, Treviso, etc., by the Emperor Henry VII. At his court lived Dante, and many of the most magnificent architectural monuments of the city were erected during his reign. Most of his successors, Cangrande II., Paolo Alboino, and others, were worthless and infamous tyrants, and in 1387 Galeazzo Visconti of Milan expelled Antonio della Scala. The male line of the family, which flourished in Bavaria under the name of Scaligeri, became extinct in 1598; the female is still flourishing in the families of Dietrichstein and Lamberg.

**Scala Nova** (anc. *Nedrolis*): town; in Asia Minor, vilayet of Aidin; 7 miles S. W. from the ruins of Ephesus (see map of Turkey, ref. 5-D). It has a good and sheltered harbor, and is the main port of the towns in the valley of the Meander. Pop. 7,500, almost all Greeks. E. A. G.

**Scald:** See BURNS AND SCALDS.

**Scaldhead:** See FAVUS.

**Scale** [from Lat. *sca'la*, flight of steps, for \**scadla*, deriv. of *scan'dere*, climb]: a mathematical instrument used in plotting and in other branches of applied geometry. It consists of a slip of wood or other material divided into parts in accordance with some mathematical law. The common ivory ruler of the instrument-maker has a great variety of scales stamped on its faces, of which the *scale of equal parts* and the *scale of chords* are of most frequent use.

**Scale of Equal Parts.**—This consists of a number of inches, or aliquot parts of an inch, laid off along a line. The representative fraction gives the ratio between the scale and the object it represents. Thus if the scale is of 1 inch to 8 miles the representative fraction is 1:506,880. The first part, counting from the left, is subdivided into ten equal parts, the 0 of the scale being at the beginning of the second part. The *principal divisions* are numbered from the 0 toward the right, and the *subdivisions* toward the left. This scale is used, in connection with a pair of dividers, for laying off and measuring the lines of a drawing. The diagonal scale is used to further divide the subdivisions. If the division is into tenths, ten parallel lines at equal distances are drawn above the simple scale, and the perpendiculars are erected at the ends of the division. Then from the points of subdivision on the uppermost line parallel lines are drawn to the corresponding points one subdivision to the right on the base line. The intercepts of these diagonals on the lines parallel to the base determine the length of the farther subdivision.

**Scale of Chords.**—This scale is used for laying off and for measuring the angles of a drawing. It is constructed by laying off from the left-hand extremity of a given line the chords of all the arcs from 0° up to 90°, corresponding to some assumed radius. The extremity of each chord is marked by a corresponding number; the origin of the scale and the extremity of the chord of 60°, which is equal to the radius, are marked in a more conspicuous manner than the other divisions. To lay off an angle, the vertex and one side being given, take the chord of 60° as a radius, and from the vertex of the angle as a center describe an arc cutting the given side; then from the point in which this arc cuts the side as a center, with a radius equal to the chord of the arc corresponding to the given angle, describe a second arc cutting the first; join this point of intersection with the given vertex; the last line will make the required angle with the given side. The method of measuring an angle by means of the scale is obvious.

**Scale:** in music, the regular series of sounds, or degrees on the stave, which form the gamut. The scale in its simplest form consists of seven steps or degrees, counted upward in regular order from a root or prime, to which series the eighth is added to complete the octave. By reverse motion the same notes form the descending scale; and by the addition of other notes above or below in a continuous order the scale may be extended to seven, eight, or more octaves. The *diatonic* scale is that which consists of the tones and semitones of the octave in their natural order and relation; as, for example, A, B, C, D, E, F, G, A. (For the origin of this scale, see the article GAMUT.) Of the diatonic scale, only two varieties are in use in modern music—viz., the *major* and the *minor*. The chief characteristic interval in both these scales is the *third*, which is one semitone greater in the major than in the minor. In ancient music several other diatonic scales were in use as described under the head of *MODE* (q. v.). The word *scale* means also the entire range or compass of sounds producible by any given instrument, as the scale of the violin, flute, organ, or piano. It is also applied by organ-builders to a graduated rule, plan, or scheme showing the lengths and diameters of the various pipes comprised in any stop. In like manner the length and thickness of the strings of a piano are regulated by a carefully graduated scheme called the *scale*; hence the terms new or improved scale refer to changes adopted by manufacturers in regard to the length and thickness of the strings.

Revised by DUDLEY BUCK.

**Scale-carp:** See CARP.

II., in person. In 1461 the sultan, hopeless of victory, acknowledged the independence of Albania and Epirus. Persuaded by the pope to violate the treaty and attack the Ottomans, Scanderbeg won eight splendid victories, the last, with 24,000 men, over Mohammed II., who had 100,000. He died at Alessio, Jan. 17, 1468, and was buried at Scutari in Albania. When in 1477 the Ottomans captured Scutari, they broke open his tomb, divided his bones into fragments as precious relics, had them set in gold and silver, and wore them around their necks as talismans to give intrepidity and success. Despite his ferocity and lack of faith, Scanderbeg is deservedly honored and revered as the "hero of Albania."

E. A. GROSVENOR.

**Scandina'via:** a name applied by the Romans to a supposed great island N. of Germany, probably the southern point of Sweden, extended by moderns as a geographic name for the peninsula between the Baltic Sea and Gulf of Bothnia on the one hand, and the North Sea and Atlantic Ocean on the other. It includes Norway, Sweden, and part of Finland. The name is sometimes used in an ethnographic sense, when it also includes Denmark. See NORWAY, SWEDEN, DENMARK, FINLAND, and LAPLAND. M. W. H.

**Scandinavian Languages:** the name applied collectively to the Teutonic languages of the Scandinavian north, inclusive of settlements from Scandinavia, notably Iceland and the Faeroes. With Gothic and West Germanic Scandinavian forms the Teutonic branch of the Indo-European family of languages. An earlier classification made Scandinavian and Gothic East Germanic as opposed to West Germanic, but, although coincidences in some points exist, no other relationship than the one at present assumed is probable. The linguistic territory of Scandinavian is Norway, Sweden, including parts of Finland and Esthonia, Denmark, including the adjoining northern parts of Schleswig and the Danish dependencies of the Faeroes, Iceland, and Greenland. At an earlier period Scandinavian was, at least for a time, the language of conquered territory elsewhere—viz., in Swedish settlements in Russia from the ninth to the eleventh century; in Norwegian settlements in the Orkneys and Shetlands from 800 to 1800; in the Hebrides, Northern Scotland, and the Isle of Man from 800 into the fifteenth century; and in Ireland from 800 to 1800; in Danish settlements in England from the ninth into the eleventh century; and in Danish and Norwegian settlements in Normandy from 900 until after 1000. From the Shetlands, Ireland, Scotland, England, Normandy, and Russia there is, however, no extant monument from ancient times.

In its historical development Scandinavian falls chronologically into several periods. Common Norse, the first, extends from the earliest time down to the beginning of the Viking age in 700. It is the homogeneous parent language of the north before it shows traces of dialectic differences. The second period is coincident with the so-called Viking age, from 700 to 1050. Instead of a single language, three dialects appear—Old Norwegian, Old Danish, and Old Swedish, including the sharply defined dialect of the island of Gotland, Old Gutnic, to which was added after the settlement of Iceland, principally from Western Norway, in the ninth century, a fourth, Old Icelandic. This dialectic separation, furthermore, proceeded in such a way that two groups were formed—an eastern, made up of Old Danish and Old Swedish, together, accordingly, called East Norse, and a western, comprising Old Norwegian and Old Icelandic, together called West Norse. At the end of the Viking age these dialects again had differentiated into languages, properly so called, whose early or "old" period extends to the Reformation, or about the year 1530, at which time the modern or "new" period begins. The whole development of the Scandinavian languages down to the Reformation is commonly included under the one term Old Norse. In Scandinavia itself, in the Viking age and later, *dǫnsk tunga*, Danish language, was applied to the language of the entire north; in the same signification *norðrǫn mál*, Norwegian language, also occurs in Norway and Iceland, but it is usually limited specifically to West Norse.

Common Norse is only scantily preserved in Scandinavian loan-words adopted by the neighboring Lapps and Finns in the early centuries of the Christian era, and in something over a hundred runic inscriptions in the earlier Germanic alphabet of twenty-four characters, the oldest of which date from about the year 500. Of the Teutonic dialects Common Norse even more than Gothic stands nearest in essential points to Common Teutonic. Important differences be-

tween Scandinavian and Gothic observable in the earliest time are: Norse retention of final *a*, *i*, *u* of stem in substantives, syncopated in Gothic; Norse *a*-stems end genit. sing. -*as*, dat. sing. -*e*, Goth. -*is*, -*a*; *an*-stems end genit. and dat. sing. -*an*, Goth. -*ins*, -*in*; *u*-stems end dat. sing. -*iu*, Goth. -*au*; *r*-stems end nom. pl. -*iR* (*R* palatal liquid), Goth. -*jus*; 1 sing. pret. of weak verbs ends -*o*, Goth. -*a*. The most important points of coincidence with Gothic are the development of Teutonic *jj* to Gothic *ddj*, Norse *ggj*; Teutonic *uu* to Gothic *ggw*, Norse *ggw*; Teutonic *z* to Gothic *s*, Norse *k*.

During the Viking age (700-1050) it is possible to obtain for the first time a tolerably complete view of the language. The sources of information are, as in the earlier period, loan-words, and not only in Finnish-Lappish, but in Celtic, Russian, and Anglo-Saxon. Runic inscriptions, besides, occur in great numbers over the whole Scandinavian north, written after the middle of the ninth century exclusively in the shorter or Old Norse alphabet of sixteen characters. To these, after the end of the ninth century, is to be added a literature consisting of the oldest Eddic lays and early Skaldic poetry cited in Icelandic MSS. of the thirteenth century, until then orally transmitted and still preserving an archaic form. The Viking age was not only pre-eminently a period of rapid organic change, but local differentiations occur also at an early period, as has already been noted, in two well-defined groups, and after the introduction of Christianity, which marks the end of the period, there are four languages instead of the one at its beginning. After the middle of the twelfth century a native literature begins in Icelandic-Norwegian, soon abundant enough to show comprehensively the facts of the language. The alphabet used is essentially the Latin. From the runic alphabet *f*, thorn, was retained, and the Anglo-Saxon *ð* was borrowed. To indicate new vowel-conditions the MSS. use, but inconsistently, various digraphs and modified forms. Vowel-length in the oldest MSS. is indicated by accent.

Old Norse in the literary period exhibited the following phonetic conditions:

#### A. Sonants:

Vowels: Palatal. Short: *i*, *j*, *e* (*ę*), *y*, *ø*. Long: *ī*, *ē*, *q*, *ý*, *ē*.  
Guttural. Short: *a*, *o*, *u*, *v*, *q*. Long: *ā*, *ō*, *ū*, *q*, *ē*.

In the function of sonants (only in unstressed syllables):

Nasals: *m*, *n*.

Liquids: —, *l*, *r*.

Diphthongs: *ei*, *au*, *øy* (*ey*); *ja*, *jo*, *jō*, *ju*, *jā*, *jō*, *jē*, *jū*; *va*, *ve* (*vg*), *vi*, *vq*, *vā*, *vē*, *vā*, *vī*, *vō*.

All vowels and diphthongs may be nasalized. *e* has a twofold value: close Teutonic *e*, whose corresponding long form is *ē*; open *e*, by umlaut from *a*, whose long form is *ā*. The two values fall together in most MSS. *ø* has a twofold value: short close *ø* from close *e* or *o*, the long form *ē*; or short open *ø* from open *e* or *q*, the long form lacking *ē*, which is used in most printed texts, was borrowed from German in the sixteenth century.

#### B. Consonants:

| CLASSES OF CONSONANTS.             | Labials.                           | Interdentals. | Dentals.            | Palatals and gutturals.    |
|------------------------------------|------------------------------------|---------------|---------------------|----------------------------|
| Explosives: voiced....             | <i>b</i>                           | —             | <i>d</i>            | <i>g</i>                   |
| voiceless..                        | <i>p</i>                           | —             | <i>t</i>            | <i>k</i>                   |
| Spirants: voiced.....              | <i>f</i> , <i>v</i>                | <i>ð</i>      | —                   | <i>g</i> (i. e. <i>ɣ</i> ) |
| voiceless....                      | <i>f</i>                           | <i>þ</i>      | <i>s</i>            | <i>h</i> , <i>ç</i>        |
| Nasals.....                        | <i>m</i>                           | —             | <i>n</i>            | <i>ɲ</i> (i. e. <i>ɳ</i> ) |
| Liquids.....                       | —                                  | —             | <i>l</i> , <i>r</i> | —                          |
| In the function of consonants..... | <i>u</i> , <i>v</i> , ( <i>w</i> ) | —             | —                   | <i>i</i> , <i>j</i>        |

There was, in addition, breath (laryngeal) *h*; *ts* is represented by *z*; *ks* by *x*.

The consonants occur long (geminated), with the exception of the spirants where *s* is the only one lengthened. *ff* occurs in loan-words. Common Norse palatal (dorsal) *R* (Teutonic *z*) is merged in Old Norse *r*.

Of the Common Teutonic vowels Old Norse maintained, under circumstances, in direct continuity: Short: *a*, *e*, *i*, *o*, *u*. Long: *ā*, *ē*, *ī*, *ō*, *ū*. Diphthong *au*. Teutonic *ā*, *ē*, is represented throughout by Old Norse *ā*, by *i*, *R*-umlaut *ē*. Teutonic *ai* by Old Norse *ā*, by *i*, *R*-umlaut *ē*; by *i*-umlaut *ei*, which in its turn as final is contracted to *ē*, and sporadically to

1. *Asymptotic* — *Asymptotic*. Uniform, which is the same as saying  
 that a sequence of functions  $f_n(x)$  is uniformly convergent to  $f(x)$  if and only if  
 for every  $\epsilon > 0$  there exists a positive integer  $N$  such that for all  $n > N$  and  
 for all  $x$  in the domain of  $f$ ,  $|f_n(x) - f(x)| < \epsilon$ . The word "uniform" is  
 used to emphasize that the  $N$  depends only on  $\epsilon$  and not on  $x$ .

[illegible]

a following is (a), (v). The  
are  $a, d, c, p, q, s, t, u, v, w$ ,  
respectively  $g, h, i, j, k, l, m, n$ ,  
presumably through  $v, g, h$

... I believe the only instances of compound  
... respectively; of compound, a bo-

etymology of *malinal* is varied. A variant originated in the Chontal Nahuatl period; it had, in the other hand, the other West Nahuatl literature caused to be an error. A tradition was accumulated later, but is, nevertheless, assumed to be one of the Nahuatl period.

...the case of *Chrysomela* in Old Sweden, Old Denmark, and elsewhere, there followed in the most variable manner, and in proceeding that time is not immediately perceived. According to the quality of the patients, the disease is either a fracture,  $B = 20 \times 20$ , or  $20 \times 10$ , or  $20 \times 15$ , or  $20 \times 25$ , or  $20 \times 30$ , or  $20 \times 40$ , or  $20 \times 50$ , or  $20 \times 60$ , or  $20 \times 70$ , or  $20 \times 80$ , or  $20 \times 90$ , or  $20 \times 100$ , or  $20 \times 110$ , or  $20 \times 120$ , or  $20 \times 130$ , or  $20 \times 140$ , or  $20 \times 150$ , or  $20 \times 160$ , or  $20 \times 170$ , or  $20 \times 180$ , or  $20 \times 190$ , or  $20 \times 200$ , or  $20 \times 210$ , or  $20 \times 220$ , or  $20 \times 230$ , or  $20 \times 240$ , or  $20 \times 250$ , or  $20 \times 260$ , or  $20 \times 270$ , or  $20 \times 280$ , or  $20 \times 290$ , or  $20 \times 300$ , or  $20 \times 310$ , or  $20 \times 320$ , or  $20 \times 330$ , or  $20 \times 340$ , or  $20 \times 350$ , or  $20 \times 360$ , or  $20 \times 370$ , or  $20 \times 380$ , or  $20 \times 390$ , or  $20 \times 400$ , or  $20 \times 410$ , or  $20 \times 420$ , or  $20 \times 430$ , or  $20 \times 440$ , or  $20 \times 450$ , or  $20 \times 460$ , or  $20 \times 470$ , or  $20 \times 480$ , or  $20 \times 490$ , or  $20 \times 500$ , or  $20 \times 510$ , or  $20 \times 520$ , or  $20 \times 530$ , or  $20 \times 540$ , or  $20 \times 550$ , or  $20 \times 560$ , or  $20 \times 570$ , or  $20 \times 580$ , or  $20 \times 590$ , or  $20 \times 600$ , or  $20 \times 610$ , or  $20 \times 620$ , or  $20 \times 630$ , or  $20 \times 640$ , or  $20 \times 650$ , or  $20 \times 660$ , or  $20 \times 670$ , or  $20 \times 680$ , or  $20 \times 690$ , or  $20 \times 700$ , or  $20 \times 710$ , or  $20 \times 720$ , or  $20 \times 730$ , or  $20 \times 740$ , or  $20 \times 750$ , or  $20 \times 760$ , or  $20 \times 770$ , or  $20 \times 780$ , or  $20 \times 790$ , or  $20 \times 800$ , or  $20 \times 810$ , or  $20 \times 820$ , or  $20 \times 830$ , or  $20 \times 840$ , or  $20 \times 850$ , or  $20 \times 860$ , or  $20 \times 870$ , or  $20 \times 880$ , or  $20 \times 890$ , or  $20 \times 900$ , or  $20 \times 910$ , or  $20 \times 920$ , or  $20 \times 930$ , or  $20 \times 940$ , or  $20 \times 950$ , or  $20 \times 960$ , or  $20 \times 970$ , or  $20 \times 980$ , or  $20 \times 990$ , or  $20 \times 1000$ , or  $20 \times 1010$ , or  $20 \times 1020$ , or  $20 \times 1030$ , or  $20 \times 1040$ , or  $20 \times 1050$ , or  $20 \times 1060$ , or  $20 \times 1070$ , or  $20 \times 1080$ , or  $20 \times 1090$ , or  $20 \times 1100$ , or  $20 \times 1110$ , or  $20 \times 1120$ , or  $20 \times 1130$ , or  $20 \times 1140$ , or  $20 \times 1150$ , or  $20 \times 1160$ , or  $20 \times 1170$ , or  $20 \times 1180$ , or  $20 \times 1190$ , or  $20 \times 1200$ , or  $20 \times 1210$ , or  $20 \times 1220$ , or  $20 \times 1230$ , or  $20 \times 1240$ , or  $20 \times 1250$ , or  $20 \times 1260$ , or  $20 \times 1270$ , or  $20 \times 1280$ , or  $20 \times 1290$ , or  $20 \times 1300$ , or  $20 \times 1310$ , or  $20 \times 1320$ , or  $20 \times 1330$ , or  $20 \times 1340$ , or  $20 \times 1350$ , or  $20 \times 1360$ , or  $20 \times 1370$ , or  $20 \times 1380$ , or  $20 \times 1390$ , or  $20 \times 1400$ , or  $20 \times 1410$ , or  $20 \times 1420$ , or  $20 \times 1430$ , or  $20 \times 1440$ , or  $20 \times 1450$ , or  $20 \times 1460$ , or  $20 \times 1470$ , or  $20 \times 1480$ , or  $20 \times 1490$ , or  $20 \times 1500$ , or  $20 \times 1510$ , or  $20 \times 1520$ , or  $20 \times 1530$ , or  $20 \times 1540$ , or  $20 \times 1550$ , or  $20 \times 1560$ , or  $20 \times 1570$ , or  $20 \times 1580$ , or  $20 \times 1590$ , or  $20 \times 1600$ , or  $20 \times 1610$ , or  $20 \times 1620$ , or  $20 \times 1630$ , or  $20 \times 1640$ , or  $20 \times 1650$ , or  $20 \times 1660$ , or  $20 \times 1670$ , or  $20 \times 1680$ , or  $20 \times 1690$ , or  $20 \times 1700$ , or  $20 \times 1710$ , or  $20 \times 1720$ , or  $20 \times 1730$ , or  $20 \times 1740$ , or  $20 \times 1750$ , or  $20 \times 1760$ , or  $20 \times 1770$ , or  $20 \times 1780$ , or  $20 \times 1790$ , or  $20 \times 1800$ , or  $20 \times 1810$ , or  $20 \times 1820$ , or  $20 \times 1830$ , or  $20 \times 1840$ , or  $20 \times 1850$ , or  $20 \times 1860$ , or  $20 \times 1870$ , or  $20 \times 1880$ , or  $20 \times 1890$ , or  $20 \times **Swimming of Short Fins.**—Body short-tailed and deep. The tail is a somewhat elongated. Composed of a single dorsal fin and anal fin. The fins are small and the fish is a poor swimmer.

long vowels immediately before another vowel) is depressed in unstressed syllables, late in stressed syllables, and, in the reflexive condition, all long vowels of the reflexive condition are short.

of *l* and *r* — In words originally trochaic almost  
all vowels in the penult were syncretized at an early  
date. The loss of vowels in Old Norse is that in syllables  
of one or more vowels is syncretized wherever by the  
loss of an ending, with an initial vowel it stands in open  
syllable. The most solution of words originally disyllabic  
in unstressed vowel is to be made best when it had not been  
lost in the two segments, since vowel is only lost when  
it stands in closed after it. In words originally trochaic  
the vowel in the penult is only in exceptional cases lost and the  
first vowel retained. An important result of the  
syncretism of vowels in the requirement of penultimate  
vowels, *i*, *e*, *u*, which figures in them through this loss  
of vowels at a certain stage immediately before them.  
In the case of *Umlaut* — In unstressed syllables *i* and *e*, *u*  
and *o*, *ö*, *ü* are not distinguished, are indistinguishable

1. *Common Norm: /t/ change to the Form of Articulation.*—  
 Common Norms *k* & *g* precede the end of the Common  
 Norms concerned because the voiced explosives *k* & *g*  
 follow the workings of the law of voiced-voiceless  
 change. *k* & *g* become *t* & *ts* before *i*, *e*, or *y*, which then  
 become *i* & *y* become *e* which went over to *k*. The  
 Common Norms *k* & *g* become, in part, in Common Norm,  
*t* & *ts* directly *k* before vowels (that, however, >  
*ts* of *ts* after vowels and *r*, and in unstressed  
 syllables, *t* after vowels and *k*, *r*). The voiced  
*t* & *ts* possibly in Common Norm, become a final  
*t* & *ts*, as *t*, *ts*. As the result of the work-  
 ings of the voiced-voiceless change, *t* & *ts* before *i* & *y*  
 become voiceless explosives *k*, *t* in unstressed syllables

after vowels frequently become the spirants *y*, *ɥ*. This change is accomplished even in the oldest MS's. A few *ty* questions are frequent. It is later, namely the spirants stand rapidly as final after vowels. The half-sound *ɥ* in the twelfth century is changed to voiced *f*. In the Common Norse period see the entries to

*Section in Case of Anisometropia*.—The bilateral parents *A* & *B* became, in the thirteenth century, the corresponding heterometropes, both within  $\delta$ . The *stigmata* post-*er*ly even before the common focus period induce pseudopia more complicated. The change of system *A* to length *b* has already been noticed.

Change in *Chondrich*.—Lengthening—bustling—  
Constitutional weakness—Is either right, and in progress.

*Regularity*.—Apparently useful as the terming some part of the normality of the model to a following  $A, \exists, \forall, \sup, \inf, \leq, \geq, \cap, \cup, \text{exp} \rightarrow \text{pr}$ , the normalities are  $\exists! \geq \Pi$  with compensatory conditioning of the preceding vowel. Female  $\exists, \forall, \sup, \inf, \leq, \geq, \cap, \cup$  respectively. The examples of an irregular vowel occur the following:  $\exists, \forall, \sup, \inf, \leq, \geq, \cap, \cup, \text{exp} \rightarrow \text{pr}$ . Other instances occur sporadically.

[illegible]

**Sharpening.**—A long consonant immediately following another consonant is invariably shortened in unstressed syllables. Old T. *stānne* pronunciation is always *stanne*.

*Loss of Consonants.*—Fricative *f* at an early time was lost as initial. Fricative *v* was lost in the following cases before *a, b, g, q*, and their initials before *l, r*, and final *l* final in the Common Norse period became *h*, which was then lost according to the rule that *h* noon and final was everywhere dropped. Old Norse *y* is lost except before *a, b, g, q, s, z, v*. Old Norse *z* is lost before *a, b, g*, and their initials, before consonants and final. There are many instances of extrinsic loss.

*East Norse and West Norse.*—The principal characteristic correspondence of the languages of the West Norse group (i. e. Old Icelandic and Old Norwegian) is contrasted with East Norse, i. e. Old Swedish and Old Danish, are as follows: West Norse retains *u*, *R*, *u*-diphth in final *u* where in East Norse it has been expressed through analogy by the uninflected form. West Norse has fricative of old *u* alone; East Norse of *u* and *r*. West Norse has *u* in many words where East Norse has *u*. West Norse changes *u* to *u*-sound *u* (to the *u*-sound) *u* in the event of hiatus. West Norse assimilates the *u*-sound to a following *u*, *u*, *u* where East Norse in many instances still retains *u*, *u*, *u*.

Within the West Norse group the principal differences between the two languages are as follows: Old Icelandic retains *au*-diphthong before *a* and *u* in which position in Old Norwegian it has been replaced through analogy by the unmutated form. Old Icelandic has *ja* where Old Norwegian has a progressive diphthong *je* in stressed syllables. Old Icelandic *ð*, before the middle of the thirteenth century, became *dh* and *ay* becoming *g* in Old Norwegian they were retained. Old Icelandic changes *g* to *ay* before *ay*, *ad*; Old Norwegian retained *g*. Old Icelandic lengthened *u*, *o*, *a* before *l* = minimum, and later *u*, *a*, *o*, *y* before *au*, *ay*; Old Norwegian retains the short vowel. Old Icelandic retains initial *ð* before *t*, *n*, *r*, which in Old Norwegian is lost at an early period.

Within the East Norse group differences in the earliest period of the languages are comparatively insignificant. Important characteristics are as follows: Old Danish changes *b, h, þ* to *f* in vowels, at first only in initial, to *p, g, d* respectively; Old Swedish maintains the original conditions; Old Danish changes *r* to *re* and final *n* in many cases to *nn* or *nnn*; Old Swedish has *gn*.

Specifically Scandinavian and characteristic of all members of the group are the following:

The *Medic-Puaster*.—Found in a single form only, of the old Tertiary *Medic-Puaster* are still to be found in common *Norfolkia*. During the Viking age a new *Medic-Puaster* appears, which is peculiar to Scandinavia. It is formed by the enbute addition of the relative pronoun *ad* to the

corresponding active form, which then ends in *-k*, *-sk*, *-zk*. These endings were supplanted early in the thirteenth century by *-z* or *-s*, which somewhat later became *-zt* or *-zst*. Modern Icelandic has *-st*; Swedish and Danish have *-s*.

*The Use of the Definite Article.*—The definite article *enn* (*inn*) stands before an adjective, but after a substantive, to which it is suffixed with (original) declension of both substantive and article. That it was originally free in the same position is shown by instances in the Old Icelandic Stockholm Book of Homilies, so called, from early in the thirteenth century.

For the history of the individual Scandinavian languages, see DANISH LANGUAGE, ICELANDIC LANGUAGE, NORWEGIAN LANGUAGE, and SWEDISH LANGUAGE.

**Scandinavian Literature:** the literary monuments of the Scandinavian language or languages. See SCANDINAVIAN LANGUAGE, DANISH LITERATURE, ICELANDIC LITERATURE, NORWEGIAN LITERATURE, and SWEDISH LITERATURE.

**Scandinavian Mythology:** the system of myths pertaining to the Scandinavian peoples. It is frequently called Norse or Northern mythology, but might more properly be denominated Teutonic mythology, since its chief deities were worshiped not only in Iceland, Norway, Sweden, and Denmark, but also in Germany and England—in short, by every branch of the Germanic or Teutonic race.

*Original Sources.*—Some information in regard to this mythology is to be gleaned from the old runic inscriptions found on monumental stones throughout the lands inhabited by Teutonic races, but mainly in the Scandinavian countries. Heathen Germany supplies a few ancient laws and glossaries containing mythological words. Formulas are also preserved by which converts to Christianity renounced the old gods and in which names of heathen divinities accordingly occur. Richer veins of information are such German heroic poems as the *Nibelungen Lied*, the *Gudrun*, the Saxon *Heliand*, and the Anglo-Saxon *Beowulf*. Cæsar, in his *De Bello Gallico*, gives us glimpses of the manner in which the Teutonic Druids preserved their mythological songs and epics, and with Cæsar Tacitus ranks as a source of information. Next after Cæsar and Tacitus come the Christians who wrote in Latin down through the Middle Ages, but they are, as a rule, very silent on the subject of the heathen religion. Among this class of writers Denmark furnishes a remarkable exception in Saxo Grammaticus. The first eight books of his *Historia Danica* contain an outline of Scandinavian mythology, the deities being presented as kings and potentates of early times. Mythological fragments must also be looked for in the customs, habits, speech, traditions, proverbs, ballads, folk-lore tales, and in the usages of the Christian Church throughout Teutonic lands. The chief sources of Scandinavian mythology are to be found in Iceland, and in Icelandic literature the most important documents are the *Elder* and the *Younger Edda*. (See EDDA and ICELANDIC LITERATURE.) The *Younger Edda* gives in prose a succinct account of the Odinic religion. It also contains some poetic quotations not found in the *Elder Edda*.

*Interpretations.—Modern Authorities.*—Both Snorre and Saxo Grammaticus present the euhemeristic interpretation of the myths, and this view prevailed until late in the eighteenth century. Euhemerism was finally superseded by the so-called physical interpretation making the divinities represent the various forces and phenomena of nature. This theory was most elaborately developed by the Icelandic

Finn Magnusson in his *Eddalæren og dens Oprindelse* (Copenhagen, 1824-26). More recently an ethical has been combined with the physical interpretation—that is, while accepting the phenomena and forces of nature as the basis of the myths, the scholar seeks to establish its deeper, philosophic, poetic, and moral value to its votaries.

The most prominent writers on Scandinavian mythology of the nineteenth century are Finn Magnusson, *Lexicon Mythologicum* (Copenhagen, 1828); Jacob Grimm, *Deutsche Mythologie* (4th ed. 1875; an Eng. trans. by Stallybrass, London, 1880); Karl Simrock, *Deutsche Mythologie* (several editions); Wilhelm Mannhardt, *Germanische Mythen* (1858); P. A. Munch, *Nordmændenes Gudelære i Hedenold* (Christiania, 1847); R. Keyser, *Nordmændenes Religionsforfatning i Hedenommen* (Christiania, 1847); N. F. S. Grundtvig, *Nordens Mythologi* (Copenhagen, 1808-32); N. M. Petersen, *Nordisk Mythologi* (Copenhagen, 1849); Benjamin Thorpe, *Northern Mythology* (London, 1851); Rasmus B. Anderson, *Norse Mythology* (5th ed. Chicago, 1891). Finally, special attention should be called to the elaborate investigations made since 1880 by the Norwegian linguist Sophus Bugge (*Studier over de nordiske gude- og helte-sagns Oprindelse*, Christiania, 1890) and by the Swedish scholar Viktor Rydberg (*Undersökningar i germanisk mythologi* (Göteborg, 1886-90). Bugge attempts to show the influence of classical mythology and early Christianity upon Scandinavian myths, while Rydberg, in opposition to Bugge, vindicates the exclusive Teutonic origin, and seeks to establish the harmonious connection between the various myths as parts of an all-embracing mythological epic. In his conflict with Bugge he is ably supported by the German scholar Müllenhoff (*Deutsche Alterthumskunde*, vol. v., 1881). An English translation of Rydberg's work by R. B. Anderson appeared in London in 1889, and bears the title *Teutonic Mythology*.

*General Features.*—The various forces and phenomena of nature—heat and cold, night and day, the seasons, thunder and lightning, life and death—led the old Teutons to speculate on the rise, development, and fall of all living things. The Scandinavian myths are inferior to the Greeks in point of beauty, but, on the other hand, they outrank them in deep significance and wealth of thought. The Greek gods live a happy life, free from care. The life of the old vikings was characterized by constant struggle and warfare, and so their gods too are engaged in an unending conflict with the powers of evil which they never wholly overcome. A peculiar feature of the *asa-faith* is its eschatology, by which it presents in the clearest manner the idea that the present world must perish and give place to a new and better one. The gods themselves know that they are in common with all other beings are sinful and contaminated by evil. They are conscious that they can not escape death and destruction, but they seek in every way to ward off that terrible catastrophe as long as possible. They also know that after the destruction of this world and out of its fragments there are to rise a new heaven and a new earth which are to be more beautiful than the present universe and free from sin and sorrow and care. In the regenerated world gods and virtuous men shall enjoy eternal happiness. The Scandinavian myths form a drama, in which every detail leads up to Ragnarok, the twilight of the gods, which constitutes the final act.

*The Creation.*—In the beginning (the prechaotic period) there were two worlds, Niflheim to the N. and Muspelheim to the S., and between them was Ginnungagap, the wide abyss. In Niflheim were the well Hvergelmir, from which flowed twelve ice-cold streams, called the Elivoger, into Ginnungagap. Muspelheim, on the other hand, was intensely bright and hot, and in the midst of it sat Surt guarding its borders with a flaming sword in his hand. The Elivogs flowed far into Ginnungagap, where the venom they carried with them became ice. Vapors rose and froze to rime, and in this way were formed many layers of congelation. Meanwhile sparks flew from Muspelheim, and when the heated blasts came in contact with the frozen vapor it melted into large drops, and by the might of him (Surt) who sent the heat these drops quickened into life and took the form of an immense giant named Ymer and of a great cow named Audhumla (chaos). Ymer was nourished by the cow's milk, and the cow fed herself by licking the salt rime on the stones, and by this licking she produced in the course of three days a man named Bure. Bure begot a son, named Bor, by the giantess Bestla, daughter of the giant Ittithorn; Bor became the father of three sons, Odin (spirit),

the heel with a flat-edged spur. The spade-foot toads burrow by day and feed at night. In the breeding season they frequent temporary pools, and at this period their voices are very loud. The allied genera belong, with one exception, to the Old World.

**Scaphoid**, or **Navic'ular Bone** [*scaphoid* is from Gr. *σκαφον*, boat + *ειδης*, appearance, form, likeness; *navicular* is from Lat. *navicula*, dimin. of *navis*, boat]: a name applied to one of the bones of the wrist, and another of the foot, on account of their fancied resemblance to a boat in shape.

**Scaphop'oda**: See MOLLUSCA.

**Scap'ula** [Mod. Lat., from Lat. *scapula* (plur.; sing. not used), shoulder-blades, back]: the shoulder-blade, a bone of the anterior or upper extremity, forming part of the shoulder. It is regarded as a pleurapophysis of the occipital (fourth cephalic) vertebra. In man and nearly all mammals it is normally firmly united to the coracoid bone, which is regarded as a process of the scapula, though representing a hæmapophysis of the occipital vertebra. The dorsum of the scapula is marked by a prominent keel or spine. The scapula is developed from seven centers, and is in man not fully ossified till the twenty-fifth year of life.

**Scap'ular** [from Late Lat. *scapula*, shoulder, formed as sing. to Lat. *scapula*, shoulder-blades]: (1) a garment worn by lay brethren and professed monastics of various Roman Catholic orders. It is a long piece of serge, one end of which falls in front and behind the wearer. Its size, color, and proportions vary. (2) A small concealed emblem worn by many Roman Catholics, who bind themselves to a certain round of religious exercises called the Devotion of the Scapular. There are several scapulars, as that of the Passion and that of the Seven Sorrows of Mary, but the original one, that of Our Lady of Mt. Carmel, was, it is claimed, revealed by the Virgin to the Blessed Simon Stock, an English Carmelite and general of that order, who died in 1265.

**Scar'ab**, or **Scarabe'us**: a black or metallic-colored dung-beetle (*Scarabæus ægyptiorum* or *Ateuchus sacer*) found in tropical countries, particularly in Egypt, where it was regarded as the symbol of the god KHEPER (*q. v.*), and the emblem of the revivification of the body and the immortality of the soul. This was by virtue of the solar significance of the object, whose Egyptian name (*kheper*) signified to be or exist and also to roll, as of the sun. The daily revolution and re-appearance of the sun typified the return of the soul to life. The beetle places its eggs in a mass of ox-dung which it rolls into a ball. The ball is propelled by the beetle with its hind legs. According to Horapollo and early Greek and Syrian writers, the female did not exist, and hence, as procreated by the male only, the scarab was held to be a symbol of the self-begetting and of the immortal, while in the hermetic literature it was regarded as the type of the "only-begotten," of "generation," of "father," of "man," and of the "world." It is evident, however, that these latter ideas are for the most part foreign to the original Egyptian conception.

The Egyptian figures of the scarab were made of gold, silver, precious stones, granite, basalt, steatite, falence, and paste, and, in the Roman period, of glass. Those in stone, falence, and paste were usually glazed blue or green. They were inscribed with religious or historical texts, with names of gods, kings, and other persons, and with magical legends and devices which are impossible of clear explanation. It is doubtful whether they were ever intended to be read. They may most conveniently be classified, according to their purpose, as funereal, ornamental, and historical. Funereal scarabs were placed on the fingers or over the heart of the dead, and in the latter case the RITUAL OF THE DEAD (*q. v.*) prescribed that certain words should be inscribed on a scarab of green jasper and put in the place of the heart. When buried with the mummy they bore a variety of names or of magical emblems that were to serve for the protection of the dead. Ornamental scarabs were an adoption by the living of the trappings of the dead, and were apparently employed principally as charms. They were strung together lengthwise as necklaces, or used singly as rings or seals, and were inscribed with the name of the reigning sovereign, or some national hero, or with magical or ornamental designs. Historical scarabs comprise all those bearing royal names or historical texts or data. The number of the former is very great, and nearly every king from Menes, the first Egyptian king, to the Roman Antoninus is represented in extant specimens. The favorite names, if frequency and number may

form the test, were those of Thothmes III., Amenophis III., and Ramses II. Curiously enough a large proportion of these scarabs date from periods other than that of the Pharaoh in question. From the reign of Amenophis III. come four scarabs which contain actual historical texts, relating to his prowess as a lion-hunter, to the limits of his kingdom (from Nubia to Mesopotamia), to the arrival of his Semitic bride, and to the construction of a sacred lake in his eleventh year, which has intimate connection with the introduction of the solar monotheism of the "heretic" king of the succeeding reign, Amenophis IV., or Khunaten. When Egyptian influence extended to the East, the Phœnicians and others borrowed this design and produced objects to which the name *scaraboids* is usually applied. The design, and in part the symbolism, were also adopted by the Gnostics, and upon their gems they inscribed appropriate legends. The manufacture of forged scarabs is pursued to a large extent in Egypt, to meet the demand of travelers, some of the specimens being made with such skill as to deceive the unwary or even experts. See Birch, *Catalogue of Egyptian Antiquities at Alnwick Castle* (London, 1880); Loftie, *Essay of Scarabs* (London, 1884); Budge, *Catalogue of the Egyptian Collection of the Harrow School Museum* (Harrow, 1887); *The Mummy* (pp. 281 ff., London, 1898), and *Catalogue of the Fitzwilliam Collection* (London, 1894); Murray and Smith, *Catalogue of Gems* (London, 1888); Petrie, *Historical Scarabs* (London, 1889), and his various works, such as *Illahun* (London, 1891), *Hawara* (1899), and *Kahun* (1890); Meyer, *Scarabs* (New York, 1894). CHARLES R. GILLET.

**Scarborough** [O. Eng. *Skardeburge*, fortified rock]: town; in Yorkshire, England; 43 miles N. E. of York and 54 miles N. of Hull (see map of England, ref. 5-J). It rises like an amphitheater from a sandy bay, and is protected on the N. by a promontory which is crowned by an historical castle dating from 1136 and rebuilt by Henry II. Scarborough is one of the principal watering-places of England; it has an aquarium, a museum, a market-hall, a spa, with mineral springs discovered in 1620, and a promenade three quarters of a mile long opened in 1890. The harbor is inclosed by three piers, and has a floating dock and a lighthouse. Jet is manufactured and there is a considerable fishing-trade. Scarborough returns one member to Parliament. Pop. (1891) 38,776. R. A. R.

**Scar'f-skin**: See EPIDERMIS.

**Scar'ridæ** [Mod. Lat., named from *Scarus*, the typical genus, from Lat. *scarus* = Gr. *σκαρπος*, a kind of sea-fish (*S. cretensis*): a family of teleocephalous fishes known as parrot-fishes, from some resemblance of their mandibles to the beak of a parrot. The body is oblong and compressed; the scales large and cycloid; the jaws well exposed, and with the teeth soldered to them, so that they form a cutting edge, but with imbricated series of older worn teeth; dorsal single, with a longer anterior spinous part (containing nine spines), and a shorter posterior portion (with ten articulated rays); anal fin corresponding to the posterior half of the dorsal, and provided with two spines and eight soft rays; pectorals with branched rays; ventrals thoracic, with one spine and five soft rays; the lower pharyngeal bones are ossified together in a solid mass. The species are confined to the tropical regions, and in these latitudes are everywhere to be found on coral-reefs and among the groves of coral. They are reported to browse upon the coral, which they cut by means of their strong trenchant jaws, in order to obtain the living polyp.

A species of the family (*Scarus cretensis*) was known to the Greeks and Romans, and was the subject of several fables. In the reign of Claudius, according to Pliny, Optatus Porcius introduced it into the Italian sea between Ostia and Campania, where it became abundant. It was regarded, at least for a time, as being the very first of fishes.

Revised by F. A. LUCAS.

**Scarlati'na**, or **Scarlet Fever** [*scarlatina* is Mod. Lat. from Ital. *scarlattina*, liter., dimin. of *scarlatto*, scarlet]: one of the acute eruptive or exanthematous fevers. It is chiefly a disease of childhood, with immunity for adults, increasing as the period beyond puberty lengthens. It is an infectious disease, propagated often by close aggregation of children, as in schools, asylums, or at play; but the contagion retains vitality with great persistence, and may be conveyed by clothing, letters, food, etc. The disease occurs sometimes as local epidemics; at other times with a graver type and great mortality, involving whole communities. In different individual cases, as well as different seasons and epidemics, it

is directed to confining the temperature within limits by the use of warmth, diaphoretic drinks, blankets, the partial covering of warm the bed pack, in very cold cases, the use of a cool bath is absolutely essential. It is equally important to note the nature of the disease, as is shown also in the typical cases. 1) In favoring the action of the kidneys by diuretic and euhydratic drinks, as lemonade and saline, the ingestion of hard, pressed by the kidneys and of better of water, protects the skin and prevents bacteria from multiplying. 2) In maintaining the normal warmth and counteracting the poison of the disease, aspirin and tincture of iron are clearly indicated, in cold temperate cases. The patient should have liberal food and atmosphere, and mild alcoholic stimulants when necessary. 3) Inotropic and antispasmodic applications to the muscles are needed to prevent the anginous form of the disease from becoming and to prevent a spread of the disease to a temporary nature. Secondary kidney disease, dropsy and cloudy urine—calls for dry cups over the kidneys, the hot-water bath, electricity as a purge, digitalis, and other diuretics.

Starport Co. of Cyprus has a claim, one of the largest belonging to Turkey, mostly concentrated between Kibris and Larnaca, a number of broken rocks some of which are nearly 4,000 feet. The capital is Nicosia, the city under the Turkish flag, 16,000.

**Searren**, *Abel van*. *Petr.*: writer of hagiography, b. in Paris, France, in 1610; was destined for the Church, but spent his youth in the greatest dissipation, and was in 1637 arrested by parents, when deprived him of the sacred hierarchy. He then used, as literature as a means of sublimation, and developed a brilliant talent for hagiography, which could largely to him the vogue it enjoyed in France, as the result of our seventeenth century. His grammar and poems are beautiful, but his *L'Épique Tragedique* (1648), *Mystères* (1651), which during the war of th. French he wrote, in opposition to the powerful minister Mazarin, and which contain the parody *Agne of Austria* had enormous success, and inspired his *Romanesque* (1657), translated into English by Oliver Goldsmith 1756, because literary types, and are still read with interest. In 1659 he married Péronne d'Avouine, afterward Madame de Montespan and she, as well as the irresistible favour of her husband, made their home a centre for all the Parisian wits. D. in Paris in 1680. A complete edition of his works, in 10 vols., was published by Brunet de la Martinière (1747).

Revised to A. G. Thompson

**Senses:** another name for chloroform. See LAMEN. ME 1982

**Scepter** [sĕp'tĕr, Pr. from Lat. *scepterum* = Gr. *σκηπτῆρ*, staff, scepter, deriv. of *σκηπτειν*, prop. against, lean on], a rod or staff-like form by which and other emblems as an emblem of authority. It has been employed as part of the regalia of almost all monarchies of which there is any record. The English scepter was in use later than Charles II.'s time, it is cruciform. The scepter for Scotland dates from the time of James V.

**Scepticism, or Skepticism** [from Gr. *skepsastai*, the Scepter, a school of philosophers liber. plur. of *skepsastai*, thoughtful, hesitating, doubtful, of *skepsastai*, consider], the doctrine which sets up as its highest principle, doubt or suspense of judgment in view of the essentially-susceptible nature of phenomena. It endeavours to establish the subjectivity of all cognition, and to show their incompatibility with each other, it infers as a consequence, the impossibility of knowing truth and takes its stand simply and solely upon its own individuality. Scepticism therefore despises and intimates mental independence, and is regarded as a necessary clearing up preparatory to philosophic thinking. At least since the time of Descartes this has been the case, and some writers, as Herbert, for example, must upon the point that all beginning in philosophy is sceptical, and, on the other hand, that all scepticism is elementary philosophy. It is most important to note that all scepticism is based upon the observation of method, and in this respect is a higher activity of the mind than the mere dogmatism which it attacks. All modern philosophy is a struggle to found itself upon method, and thus to place its structure above the accidents arising from scepticism. Sceptical arguments coincide neither with the stage of *conception* nor with that of *simple reflection*—it is neither from the first nor second intention of the mind, so-called, but from a third, or rather a fourth, intention, a perception not of external objects, not of species or genera, but a perception of the activity or process of reflection itself. Hence simple common sense, aside from the deepest speculative insight, may be attacked and undermined by scepticism, but sceptical arguments can have no weight except for those minds that abandon other points of view and give attention to the method of cognition.

The ancient scepticism is directed against sense-perception, and usually counts Pyrrho of Elis as its founder. (Clement, the Stagirite, had reached the doctrine of omniscience, nothing exists, nothing can be known if it does exist. Socrates had asserted that he knew only that he knew nothing. The Megarian Stilo had shown the contradictions in sense-perception involved in postulating immutability of individual objects. The scepticism of the second and third schools of the Middle Academy, founded respectively by Arcesilaus and Carneades, was of a milder type. But Pyrrho, who seems to have learned much from Stilo, de-

veloped scepticism as a system of philosophy, and made universal doubt the highest principle, and *εὔρεσις* (suspension of judgment) and *ἀταραξία* (tranquillity of mind, imperturbability) the practical objects to be attained. With Pyrrho, Timon the Sillograph and Ænesidemus are reckoned as the representatives of the old sceptics. The last named collected Pyrrho's arguments in the form of ten tropes, as follows: Knowledge of truth is uncertain, because of the difference (1) in the organization in animals resulting in different modes of knowledge (how can we decide?); (2) in the human constitution in tastes, feelings, desires, capacities, etc.; (3) in the structure of the organs of sense, the same object being white to the eye, sweet to the taste, rough to the touch, etc.; (4) in the mental and physical conditions at different times; (5) in the position, distances, and intervals of objects; (6) in the appearance of objects by reason of their complication with each other; (7) in the appearance of objects owing to their variation in quantity, size of parts, etc.; (8) in objects on account of the general relativity of things known; (9) in the frequency with which objects are observed; (10) in regard to education, all customs, habits, laws, ideas, faith, and theories being derived from it. The later school of sceptics includes Agrippa, Favorinus, Sextus Empiricus, and others. Agrippa reduced the tropes to five: (1) The discordance of opinions renders all uncertain; (2) every proof rests upon grounds which again need proof, and so *ad infinitum*; (3) all our ideas are relative; (4) all systems rest upon hypotheses; (5) the vicious circle, demonstrating the grounds on which the proof rests by that which is proved by them. Sextus Empiricus has left us a complete account of ancient scepticism, and himself sums up the whole as follows: Nothing is certain in itself, as is proved by the diversity of opinion, and nothing can be made certain by proof, since it derives no certainty from itself, and, if based on other proof, leads us either to the *regressus ad infinitum* or to a vicious circle.

Among famous sceptics of later times are Algazel the Arabian, Duns Scotus the Schoolman, Agrippa of Nettesheim, Glanvill, Nicolaus Cusanus, and Hirnhaym, who reject science in the interest of faith. Montaigne, Charron, Sanchez, and Le Vayer revive the ancient scepticism. Hume is the greatest modern sceptic. He saps all dogmatism by making habit or "invariable sequence" the origin of the idea of causality, and thus occasions by way of reaction the rise of the Kantian system and its derived schools, which "criticise the faculty of cognition" and build their structures upon insight into method, and thus eliminate scepticism by making its partial view (of method) a complete one.

WILLIAM T. HARRIS.

**Scerodite:** See SINTERS.

**Schabzieger Cheese:** See CHEESE.

**Schack, shaak, ADOLF FRIEDRICH, Graf von:** poet; b. at Schwerin, Mecklenburg, Germany, Aug. 2, 1815; studied law at Bonn, Heidelberg, and Berlin, devoting much of his time to the study of Oriental and European languages; traveled in Italy, Egypt, Syria, Turkey, Greece, and Spain, where he made extensive researches into the history of the Spanish drama; was called to Munich by King Maximilian of Bavaria where he resided up to the time of his death, Apr. 14, 1894. He published *Epische Dichtungen aus dem Persischen des Firdusi* (1853); *Stimmen vom Ganges* (1856); *Gedichte* (1866); *Nächte des Orients* (1874); *Weihgesänge* (1878); *Lotusblätter* (1883); *Memnon* (1885); and a number of epic and dramatic poems. Like Rückert, with whom he may be compared in many respects, he was a master of the poetic form, not only in his translations from Oriental literatures, but also in his original productions, which, moreover, are distinguished by their deep philosophic thought.

JULIUS GOEBEL.

**Scha'dow, FRIEDRICH WILHELM, von:** painter; b. in Berlin, Sept. 6, 1789. He was a son of J. G. Schadow, the sculptor, and was thoroughly taught. In 1810 he went to Rome with his brother Rudolph, the sculptor, and there was influenced by Cornelius and Overbeck; became a Roman Catholic and a member of the religious and somewhat mystical school which those painters had brought together. In 1819 he returned from Italy to Berlin, and was made professor in the Academy of Fine Arts. In 1826 he was made director of the Düsseldorf Academy. D. at Düsseldorf, Mar. 19, 1862. In the Berlin National Gallery are his picture *Christ at Emmaus* and a *Portrait Group* of his father and brother with the sculptor Thorwaldsen. At the Stadel Institute at Frankfurt is the picture of the *Wise and Fool-*

*ish Virgins*; at the old Pinakothek at Munich is a *Holy Family*; and at the Cathedral of Anspach is a *Christ*. His last work was an allegorical painting founded upon Dante's *Divina Commedia*.

RUSSELL STURGIS.

**Schadow, JOHANN GOTTFRIED:** sculptor; b. in Berlin, May 20, 1764; studied drawing and sculpture in his native city and at Rome 1785-87, and was appointed professor at the Academy of Art in Berlin in 1788. His life was spent chiefly at Berlin from this time on, but he traveled much, especially in Italy. His style is founded upon classical traditions. His principal works are statues of Frederick the Great, in Stettin; Leopold of Dessau, in Zietzen, and the Count de la Marck, in Berlin; Luther, in Wittenberg; the monument of Marshal Blücher, at Rostock; and a number of busts, some of which are in the Walhalla on the Danube near Ratisbon, etc. He also modeled the quadriga over the Brandenburg gate of Berlin, and a frieze on the outside of the mint in that city. D. in Berlin, Jan. 27, 1850.

Revised by RUSSELL STURGIS.

**Schadow, RUDOLPH, called also Zeno Ridolfo:** sculptor; b. in Rome, July 9, 1786; was the oldest son of Johann G. Schadow. He studied with Thorwaldsen and Canova, and became famous at an early age. He was much employed, and perhaps too constant application caused his early death, at Rome, Jan. 31, 1822. Among his works are the bas-reliefs of the *Daughters of Leucippe, Socrates and Theodora*, and that of the tomb of the Marquis of Lansdowne; the statues of St. John the Baptist, Diana, and a Bacchus; a group of the Virgin and Child; and his last work, *Achilles defending the Body of Penthesilea*.

RUSSELL STURGIS.

**Schaeffer, shä'fer, CHARLES FREDERICK, D. D.:** theologian; b. at Germantown, Pa., Sept. 3, 1807; graduated at the University of Pennsylvania; studied theology privately; pastor at Carlisle, Pa., Hagerstown, Md., Lancaster, O., Red Hook, N. Y., and Easton, Pa.; professor of theology, Columbus, O., 1840-45, Gettysburg, Pa., 1857-64, and Philadelphia, Pa., 1864-79. D. in Philadelphia, Pa., Nov. 24, 1879. Among his more important works are the translation of *Lechler on Arts* in the English edition of Lange's *Commentary*, the translation of Kurtz's *Sacred History*, a revised translation of Arndt's *True Christianity*, and a *Commentary on Matthew*. Dr. Schaeffer was a prominent advocate of confessional Lutheranism, and his articles in *The Evangelical Review* of Gettysburg contributed powerfully to the movement that resulted in the establishment of the General Council.

H. E. JACOBS.

**Schaeffer, CHARLES WILLIAM, D. D., LL. D.:** theologian; nephew of Rev. Charles Frederick Schaeffer; b. at Hagerstown, Md., May 5, 1813; graduated at University of Pennsylvania, and Theological Seminary at Gettysburg, Pa.; pastor at Barren Hill, Pa., 1835-40, Harrisburg, Pa., 1840-49, Germantown, Pa., 1849-74; professor in the Lutheran Theological Seminary, Philadelphia, 1864-94, when, on his resignation of the chair of Church History, he was elected professor emeritus. Dr. Schaeffer was for many years president of the Lutheran Ministerium of Pennsylvania, has been president of the General Synod and the General Council, and has served the University of Pennsylvania as a trustee since 1850. He has published *Early History of the Lutheran Church in America* (1857), *Family Prayers*, and one volume of a translation of the *Halle Reports* (Reading, Pa., 1882).

H. E. JACOBS.

**Schaeffer, DAVID FREDERICK, D. D.:** Lutheran pastor and theologian; b. at Carlisle, Pa., July 22, 1787; graduated at the University of Pennsylvania 1807; studied theology privately; pastor at Frederick, Md., 1808, until within a year or two before his death. He conducted a private theological seminary, and directed the studies of a number of most useful pastors. He was one of the most active founders of the Theological Seminary at Gettysburg, and of the General Synod, of which body he was secretary for a number of years from its founding. He edited *The Lutheran Intelligencer*, the first English periodical in the Lutheran Church of America. D. at Frederick, Md., May 5, 1837. H. E. JACOBS.

**Schaff, PHILIP, S. T. D., LL. D.:** b. at Coire, Switzerland, Jan. 1, 1819; studied at Coire, Stuttgart, Tübingen, Halle, and Berlin; took the degree of B. D. and passed the examination for a professorship in Berlin 1841; traveled as tutor of a Prussian nobleman through several European countries; returned to Berlin and lectured in the university on exegesis and church history 1842-44; was called to a professorship in the theological seminary of the German Reformed Church

maintained there as a teacher till 1873. In 1877 he produced his first piano concerto. Since then he has composed largely for the piano and for orchestra, and also has written an opera, *Matasvintna*. In 1890 he visited the U. S. on a concert tour, and the next year he settled in New York, where he established a conservatory of music. D. E. H.

**Schauffler**, show'f'ler, WILLIAM GOTTLIEB, D. D., LL. D.: missionary; b. at Stuttgart, Germany, Aug. 22, 1798; resided in Russia during his youth; studied theology, and went to Turkey as an independent missionary 1825, but having soon convinced himself that he needed more thorough training, removed to the U. S. in 1827; graduated at Andover Theological Seminary 1830; was ordained Nov. 14, 1831; was missionary to the Jews in Constantinople, Turkey, 1831-55, and after that to the Moslems; he translated the entire Bible into Hebrew-Spanish and into Turkish, the New Testament, the Pentateuch, and Isaiah in the latter language having been printed in Germany under his supervision; and published an *Essay on the Right Use of Property* (1832). He was also author of a work entitled *Meditations on the Last Days of Christ*. D. in New York, Jan. 26, 1883.

**Schaumburg-Lippe**, showm'boorch-lip'pe: a principality and state of the German empire, between Hanover and Westphalia. Area, 131 sq. miles; pop. (1890) 39,183. The southern part is hilly and well wooded; the northern is flat, and here is found lake Steinhudermeer, occupying an area of 22,000 acres. The actual revenue in 1892-93 was 1,096,516 marks; the public debt in 1891 was 510,000 marks. Capital, Bückeburg; pop. (1890) 5,186.

**Schedone**, skā-dō'nā, BARTOLOMEO (called also SCHIDONE): painter; b. at Modena, Italy, in the latter part of the sixteenth century. He was supposed to have been a pupil of the Caracci, but his paintings seem to show a deep study of Correggio and Raphael. He worked in the palace and in the cathedral of his native city. His chief works are a *Madonna di Field*, at the Academy of Parma, the *Birth of Christ*, and a *Madonna*, at Loreto. His pictures at Capo di Monte, Naples, were painted for his generous patron, Duke Ranuccio of Parma. He is also well represented in the Louvre. He distinguished himself as a portrait-painter. He died at Parma in 1615 of grief at having lost a large sum of money through gambling. W. J. STILLMAN.

**Scheele**, shā'le, KARL WILHELM: chemist; b. at Stralsund, Pomerania, at that time a Swedish possession, Dec. 19, 1742; studied chemistry in Stockholm and Upsala, and settled in 1777 as apothecary at Köping, near Stockholm, where he died May 21, 1786. By his comprehensive chemical analyses he discovered tartaric acid, manganese, chlorine, baryta, glycerin, the pigment called Scheele's green, and the coloring-matter of Prussian blue. His papers were collected and published in French, English, German, and Latin (*Mémoires de Chimie*, 2 vols., Paris, 1785-88). In his *Chemical Observations and Experiments on Air and Fire* (Leipzig, 1777; translated into English, London, 1780) he described oxygen, unaware of its previous discovery by Priestley.

**Scheele**, KNUT HENNING GEZELIUS, von, D. D.: bishop; b. at Stockholm, Sweden, May 31, 1838; educated at Upsala, where he became Professor of Theology in 1879, whence he was appointed Bishop of Gotland, with residence at Visby, in 1885. He visited the U. S. in 1893 as special representative of the King of Sweden at the tercentenary of the Decree of Upsala, celebrated by the Swedish Augustana Synod. Among the more important of Bishop von Scheele's works is a work on symbolics, published in both Swedish and German, and an outline of the same subject in Zöckler's *Handbuch der Theologischen Wissenschaften*. H. E. J.

**Scheele's (sheelz) Green**, or **Swedish Green**: name given to the arsenite of copper. Scheele prepared it by slowly pouring a hot solution of 11 parts of arsenious oxide in 32 of potash into a hot solution of 32 parts of blue vitriol, with constant stirring. Sharples says the best results are obtained when a solution of 2 parts arsenious oxide and 8 parts cryst. carb. soda is mixed with a solution of 6 parts blue vitriol. The product is a yellowish-green powder, consisting essentially, according to Sharples, of  $\text{Cu}_2\text{As}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$ , or  $\text{CuO}$ , 51.49;  $\text{As}_2\text{O}_3$ , 41.93;  $\text{H}_2\text{O}$ , 7.93. It may or may not contain basic sulphate and carbonate of copper, according to the proportions and degree of dilution of the materials. *Parrot green*, *pickel green*, and many varieties of *Brunswick*, *Newwed*, and *mineral green* and *blue*, consist of Scheele's

green with more or less hydrate, basic sulphate, or basic carbonate of copper, and sometimes considerable gypsum. Scheele's green is little used in the U. S., being replaced by the more brilliant SCHWEINFURTH GREEN (q. v.).

Revised by IRA REMSEN.

**Scheffel**, JOSEPH VIKTOR, von: poet and novelist; b. at Karlsruhe, Germany, Feb. 16, 1826; studied law and German philology at the Universities of Heidelberg, Munich, and Berlin; practiced law for several years; traveled in Italy; and after his return, devoted himself entirely to literary pursuits. In 1854 he published his famous *Trompeter von Säckingen*, an epic poem of great poetic charm, and in 1858 his great historical novel *Ekkehard*, a story of the tenth century. Both of these works were little noticed at first, until the great events of contemporary German history and the subsequent establishment of the empire gave rise to a renaissance of German antiquity. Scheffel's artistic description of German life of the past, his delightful humor, and true patriotic feeling, then led to his being imitated by a host of followers, and for a long time the historical novel was the literary fashion of Germany. He became equally popular as a lyric poet, especially by his *Gaudeamus* (1868), a collection of lyrics of quaint and exquisite humor, many of which became favorite student songs. His *Bergpalmen* (1870), a later collection of poems, is less popular, though it probably contains his best lyric productions. D. Apr. 9, 1886. JULIUS GOEBEL.

**Scheffer**, ARY: historical and portrait painter; b. at Dordrecht, Holland, Feb. 10, 1797; son of Johann Baptist Scheffer, historical painter (1773-1809); pupil of Guérin in Paris; officer Legion of Honor 1825. He was not in sympathy with either the academic or classic style of painting taught by his master, nor with that of the new school of romanticists led by Delacroix and Géricault, and he formed a style of his own, more sentimental than vigorous and healthy. He was a devoted adherent of the Orleans family, and accompanied the Duc d'Orléans to the siege of Antwerp. After returning to Paris, he painted pictures of military scenes for the Versailles Museum, and when the Revolution of 1848 broke out he assisted the king and his family to escape from Paris, and retired to Holland. He went to England later, and returned to Paris after the *coup d'état* of 1851, but kept aloof from politics. D. at Argenteuil, France, June 15, 1858. One of his most noted pictures, *The Sultane Woman* (1827), is in the Louvre. Other works are in the museums at Versailles, Nantes, Marseilles, Montpellier, and Amsterdam, and in the National Galleries in London and Berlin. WILLIAM A. COFFIN.

**Scheldt**, skelt (anc. *Scaldia*, Fr. *Escaut*): the most important river of Belgium. It has its rise in a small lake in the department of Aisne, France, and by a circuitous passage enters Belgium near Tournay; thence flows N. N. W. past Tournay, province of Hainault, at Hérisson becomes the boundary of this province and East Flanders, and at Escamaffles becomes the common boundary between West and East Flanders; thence N. N. E., past Oudenarde to Ghent, where it receives the Lys on the left; thence E. S. E. to Dendermonde and N. N. E. to Antwerp, at which point it becomes a noble stream, with a fine harbor sufficient for the largest ships. Leaving Antwerp, its course is N. W. The island of South Beveland divides it into two arms; the left, or south, known as The Hond or West Scheldt, and the most important, enters the North Sea near Flushing. The right, or north, called the East Scheldt arm, is divided again by the island of North Beveland before it flows into the sea. It has an entire length of 210 miles, and is navigable to Condé, near its source. Among its numerous affluents, the Scarpe, Lys, and Darne, from the left, and the Dender and Rupel, from the right, are the most important. A system of canals connects this stream with the principal cities of Belgium. The entrance to the river is rendered somewhat difficult for large vessels by sandbanks which form at its mouths. These mouths are almost opposite that of the Thames, thus increasing its commercial and naval importance. Revised by M. W. HARRINGTON.

**Schelling**, shelling, FRIEDRICH WILHELM JOSEPH, von: philosopher; b. at Leonberg, a village near Stuttgart, Württemberg, Jan. 27, 1775; d. at the baths of Ragatz, Switzerland, Aug. 20, 1854. His father, distinguished as an Orientalist, was a country clergyman who became prelate at Maulbronn; he directed his son's education. In his sixteenth year young Schelling entered the theological seminary at Tübingen, and studied theology in connection with philosophy and

**Schem, shem, ALEXANDER JACOB:** author; b. at Wiedenbrück, Germany, Mar. 16, 1826; studied at the gymnasium of Paderborn 1839-43; at the university of Bonn 1843-45, and at that of Tübingen 1845-46; edited Westphalian newspapers 1849-51; removed to the U. S. 1851; was Professor of Hebrew and of Modern Languages at Dickinson College, Carlisle, Pa., 1854-60, after which he devoted himself to literature in New York, chiefly in the departments of geography and statistics; edited ecclesiastical almanacs for 1860 and 1868-69; wrote for religious and political newspapers; aided Rev. George R. Crooks in the preparation of his *Latin-English School Lexicon*; was one of the editors of *The Methodist* and of *The Methodist Quarterly Review*; was a contributor to Appleton's, McClintock & Strong's, and Johnson's *Cyclopedias*, and prepared a revised American edition of a *Conversations-Lexicon* in the German language (12 vols., 1869, seq.). D. at West Hoboken, N. J., May 21, 1881.

Revised by A. OSBORN.

**Schemnitz, shem'nits:** a large mining-town in Hont county, Northern Hungary; on the Schemnitz; 65 miles N. by W. of Budapest, at an elevation of 1,300 feet above the sea (see map of Austria-Hungary, ref. 5-G). It has a celebrated mining-school with chemical laboratories and a fine collection of minerals. The mines, which yield gold, silver, copper, and iron, extend below the city. Pop. 15,265.

**Schenck, skenk, ROBERT CUMMING:** diplomat; b. at Franklin, O., Oct. 7, 1809; graduated at Miami University in 1827; studied law and was admitted to the bar, beginning practice at Dayton; member of State Legislature 1841 and 1842, and member of Congress 1843-51; U. S. minister to Brazil, and employed on diplomatic missions to Buenos Ayres, Montevideo, and Paraguay 1851-54. Appointed brigadier-general of volunteers on the outbreak of the civil war in the U. S., he commanded a brigade at the battle of Bull Run July 21, subsequently in Western and Northern Virginia; engaged at the battle of Cross Keys Apr., 1862. At the second battle of Bull Run he was severely wounded and incapacitated until December, when, having meanwhile been promoted to be major-general from Aug. 30, he was placed in command of the Eighth Army-corps and Middle department. He resigned from the army Dec., 1863, and resumed his seat in Congress, having been re-elected, serving at the head of the committee on military affairs and that of ways and means; appointed minister to Great Britain Dec. 22, 1870; resigned 1876, and resumed the practice of law in Washington, D. C., where he died Mar. 23, 1890.

**Schenck, WILLIAM EDWARD, D. D.:** clergyman; b. at Princeton, N. J., Mar. 29, 1819; was educated at Princeton College and Seminary with one year in the study of law between the two courses; pastor at Manchester, N. J., 1842-45; Hammond Street church, New York, 1845-48; First church, Princeton, N. J., 1848-52; superintendent of church extension in the Presbytery of Philadelphia 1852-54; secretary, 1854-86, and editor, 1862-70, of the Presbyterian board of publication; permanent clerk of the General Assembly (Old School) 1862-70; and vice-president of the American Colonization Society since 1877. Dr. Schenck has published many minor works and several books, including *Children in Heaven*; *Historical Account of the First Presbyterian Church of Princeton, N. J.* (Princeton, 1851); *God our Guide*; *The Fountain for Sin* (1867-68; translated into German); *Church Extension in Cities*; *General Catalogue of Princeton Theological Seminary* (1881); and *Necrological Reports of Princeton Theological Seminary* (1874-84).

C. K. HORT.

**Schenectady:** city; capital of Schenectady co., N. Y.; on the Mohawk river, the Del. and Hudson and the N. Y. Cent. and Hud. River railways, and the Erie Canal; 17 miles W. of Albany (for location, see map of New York, ref. 4-J). It has connection with the West Shore Railroad at South Schenectady and with the Fitchburg at Scotia, on the opposite side of the river, and local roads connect it with Saratoga and Troy. The city is located in one of the most beautiful portions of the renowned Mohawk valley. The older parts are along the river-bank, the modern are on the heights which surround the valley here. The supply of water is by the Holly system. The city has gas and electric lights and an electric street-railway.

**Public Buildings.**—Among the notable public buildings are the Ellis Hospital, Children's Home, Home of the Friendless, Free Public Library, the Van Curler opera-house, and a State armory.

**Churches and Schools.**—Schenectady has 21 churches and

4 missions, the former divided as follows: Methodist Episcopal, 3; Roman Catholic, 3; Baptist, German, Presbyterian, Protestant Episcopal, and Reformed, each 2; and African, Congregational, English Lutheran, German Lutheran, and Jewish, each 1. There is a Y. M. C. A., with a commodious building. The city is the seat of UNION COLLEGE (q. v.), the academical department of Union University, and of Union Classical Institute, a preparatory school. The public-school system comprises graded schools, occupying six modern buildings, having about 2,500 pupils, and costing annually about \$41,000. There are two parochial schools, a business college, and several private schools.

**Finances and Banking.**—The city receipts for the year ending Feb. 28, 1894, were \$444,114, and expenditures \$415,977; the debt was \$470,569, and the property valuation \$9,399,186. In 1895 there were two national banks with combined capital of \$200,000, a State bank with capital of \$100,000, and a savings-bank with deposits of \$1,500,000.

**Business Interests.**—The manufacturing industries are numerous and extensive, and include the main plant of the Edison General Electric Company, the Schenectady Locomotive-works, Westinghouse Agricultural Works, car-works, copper and sheet-iron works, foundries, 3 knitting-mills, mica-insulator works, shawl-factory, women's underwear mill, shirt-factory, planing-mills, boat-yards, and carriage, varnish, and sash and blind factories. There are 3 dailies and 4 weekly newspapers.

**History.**—Schenectady is one of the oldest cities in the State. It was settled by Arent Van Curler in 1661; patented in 1684; burned by the French and Indians, who massacred all but sixty of its inhabitants in 1690; created a borough in 1765; incorporated as a city in 1798; and had almost its entire business portion burned in 1819. Pop. (1880) 13,655; (1890) 19,902; (1895) estimated, 24,000.

EDITOR OF "DAILY GAZETTE."

**Schenkel, DANIEL:** theologian; b. at Dögerlin, Zurich, Switzerland, Dec. 21, 1813; studied theology in Basel under de Wette and Hagenbach, afterward in Göttingen; was appointed pastor at Schaffhausen in 1841; Professor of Theology at Basel in 1849, and in 1851 at Heidelberg. He became professor emeritus in 1884. He edited *Allgemeine Kirchenzeitung* (1852-59) and *Allgemeine Kirchliche Zeitschrift* (1859-72), and *Bibel-Lexicon* (1869-75, 5 vols.); wrote *Das Wesen des Protestantismus aus den Quellen des Reformationszeitalters beleuchtet* (3 vols., 1846-51; 2d ed. 1 vol., 1862), which defended the thesis that Protestantism had for its end rather to found a new community of believers than a new theology or polity. This idea he again developed in his *Das Prinzip des Protestantismus* (1852). Up to this time he was orthodox, but with his *Christliche Dogmatik vom Standpunkte des Gewissens* (2 vols., 1858-59) he came out on the liberal side, and this altered position is yet more plain in his *Das Charakterbild Jesu* (1864; translated into English by W. H. Furness, 1866), which represents Jesus as a mere man without miraculous power. He was the founder of the German Protestant Union. D. at Heidelberg, May 21, 1885.

**Schenckendorf, MAX, von:** poet; b. at Tilsit, Germany, Dec. 11, 1783; studied law at the University of Königsberg; practiced his profession until the breaking out of the wars of liberation in 1813, when he entered the Prussian army. Though unable to fight on the battle-field, on account of the lameness of his right arm, he inspired his comrades by his excellent war-songs. Many of these songs, which appeared in the collection of his *Gedichte* (1815), possess the true ring of popular poetry, and, like the war lyrics of Körner and Arndt, they were a powerful help in arousing German patriotism against the tyranny of Napoleon. See A. Hagen, *M. von Schenckendorf* (1863). JULIUS GOEBEL.

**Scherer, she-rär, EDMOND HENRI ADOLPHE:** critic; b. at Paris, Apr. 8, 1815; was educated in the Collège Bourbonnais, Paris; studied theology at Oxford, England, and Strassburg, and was in 1845 appointed Professor of Exegesis at Geneva. His views of the inspiration of the Bible having undergone some modification, he resigned his chair in 1852 and settled in Paris, where he became one of the leaders of the liberal movement within the Protestant Church. For many years he wrote literary and political articles for *Le Temps*. Elected a member of the Legislative Assembly in 1871, he took an active part in politics. D. at Versailles, Mar. 16, 1889. His principal theological works are *De l'état actuel de l'Eglise Réformée en France* (1844); *La Critique et la Foi* (1850); *Alexandre Vinet, sa vie et ses*

rector of the theater at Manheim, announced *The Robbers* for representation on the stage, and Schiller, being refused leave of absence, went to Manheim without it, and witnessed the first successful performance of the play Jan. 18, 1782. On his return to Stuttgart he was arrested and temporarily imprisoned; the duke endeavored to exact a pledge from him that he would write no more poetry, and the probability of sterner measures being taken induced Schiller to take refuge in flight. In September of the same year, under an assumed name, in company with a musician named Streicher, he left Stuttgart, and for nearly a year afterward remained in concealment on an estate belonging to the noble family of Wolzogen, near Meiningen. During this time he completed his plays of *Fiesco* and *Intrigue and Love*. The first of these, rejected by Dalberg, was finally produced at Manheim, and became so popular that the author was offered the post of dramatic poet to the theater there, with a meager salary. He accepted the position, undertook also the editing of a new dramatic periodical, *Thalia*, and remained in Manheim until the spring of 1785, when an invitation from Körner (the father of the famous poet, Theodore Körner) drew him to Leipzig. Soon afterward he followed Körner to Dresden, and was supported in the most generous manner by that faithful friend during two years while writing his tragedy of *Don Carlos*, his historical sketch *The Revolt of the Netherlands*, the romantic fragment *The Ghost-seer*, and a number of lyrical poems. In the summer of 1787 Schiller visited Weimar for the first time, and made the acquaintance of the authors Wieland and Herder. He also met his future wife, Charlotte von Lengefeld, whom he returned to see the following summer, and in the garden of the Lengefeld family at Rudolstadt first met Goethe. The interview has a special interest from the fact that these poets, destined to be such friends and collaborators, disliked each other at first sight. Nevertheless, it was through Goethe's influence that Schiller early in 1789 was offered the place of Professor of History at the University of Jena. He at first hesitated to accept on account of want of preparation, but he was tired of his homeless life, and saw in the appointment the possibility of marriage. His opening lectures were remarkably popular. He married Charlotte von Lengefeld early in 1790, and devoted himself to a life of study and creative activity. But during the following year he was brought to the verge of the grave by an inflammation of the lungs; the report of his death was circulated, and he was already so well known beyond the boundaries of Germany that two Danish noblemen, the Prince of Augustenburg and Count von Schimmelmann, sent him the sum of 1,000 thalers annually for three years, in order that he might rest and recover his strength. His *History of the Thirty Years' War* was published in 1793, and in the autumn of that year he returned to Würtemberg, with his family, and remained until the following spring, his visit being wisely ignored by the duke. Through consultation with the publisher Cotta a literary periodical called *The Hours* was projected, and this led to the most important crisis of his life. Goethe's co-operation was too important to be overlooked; the two poets discovered unexpected points of sympathy, and soon became united in a personal and literary friendship as noble as it is rare in history. Schiller soon freed himself from the influence of Kant, which had for a time interrupted his poetical activity, but which had also been of great influence on his artistic development; stimulated by Goethe, he wrote his finest ballads and lyrics, and was greatly encouraged by the success of his periodical, *The Hours*. His plan for a great drama based on the history of Wallenstein was resumed, and the completion of the work as a trilogy or triple drama in the year 1799 placed him at once in the first rank of authors. His ill health, however, made it more and more difficult for him to discharge the duties of his professorship at Jena; a closer intercourse with Goethe became an intellectual necessity, and in the year 1800, after the grant of a liberal pension by the duke, Karl August, he removed to Weimar. His friendship with Goethe drew upon both the bitter hostility of most of the secondary authors of Germany, and many attempts were made to estrange the two great friends. The splendid rhythm, rhetoric, and artistic completeness of form of Schiller's *Song of the Bell*, *The Diver*, and his classical ballads bore down all narrow criticism, and secured his fame as a poet in the universal judgment of the German people. His *Wallenstein* was a great success upon the stage; not less so his *Maria Stuart*, which appeared in 1800, and the *The Maid of Orleans*, in 1801. In the year 1802

Schiller was ennobled by the emperor, Francis II. His next work, *The Bride of Messina* (1803), was an attempt to unite the stately formalism of the antique Greek chorus with the free romantic element of modern dramatic art. Notwithstanding passages of rare lyrical beauty, the experiment can not be considered successful, although the play is occasionally given on the German boards. *William Tell*, which appeared in 1804, although poetically inferior to *Wallenstein*, was Schiller's greatest dramatic success. He visited Leipzig and Berlin when it was produced, and was received with the greatest popular enthusiasm. There was a chance of his obtaining the post of director of the royal theater in Berlin, but the duke doubled his pension in order to retain him, and Schiller was also unwilling to relinquish his intercourse with Goethe. He began a new play, *Demetrius*, and was well advanced in the work when, in the spring of 1805, his failing vital power reached its limit. A simple cold apparently turned the balance, and on May 9, he died. A dissection showed that under no circumstances could his life have been prolonged for more than six months more. His remains were exhumed in 1826, placed in a granite sarcophagus, and transferred to the vault of the grand ducal family, where they now repose beside those of Goethe. While as a poet Schiller holds one of the most prominent places in German literature, ranking next to Goethe, his influence as a philosopher and critic must not be overlooked. Quite early in his literary career we discover a pronounced talent for philosophy, a talent which he afterward, by the careful study of Kant's system, developed to so great an extent that he ranks among Germany's greatest thinkers. His philosophic studies were, however, not directed to the logical operations of the human mind, but rather to ethics and aesthetics, and a number of essays (*Ueber Anmuth und Würde*, 1793; *Ueber das Erhabene*, 1793; *Briefe über die ästhetische Erziehung des Menschen*, 1795, etc.) give evidence of the profoundness with which Schiller grasped and solved the most difficult problems. In these brilliantly written essays the rigidity of Kant's ethics and the one-sidedness of his aesthetics are overcome, and the innermost thoughts of the great classical period of German literature, which culminate in the advancing of a modern ideal of humanity superior to that of the Greeks, find their powerful philosophic expression. The results of his philosophic studies Schiller with a remarkable skill undertook to turn into poetry in his famous philosophic poems (*Das Glück*, *Der Genius*, *Das Ideal und das Leben*, etc.), the like of which no other literature possesses. The influence of philosophy on Schiller's critical activity is also quite evident. He stands next to Lessing as a critic of German literature. While the former carefully established the subtle formal distinctions between the various branches of poetry, and laid down the laws which govern poetic production accordingly, Schiller discusses chiefly the nature of poetry and its different branches, inquiring besides into the psychological operations of the poet's mind. To him we owe the best critical estimate of Goethe's genius (*Correspondence with Goethe*), and his famous essay on *Nature and Sentimental Poetry* has influenced literary criticism to the present time.

In Schiller the interest belonging to individual character is associated with his genius, and lends to it the magnetism which accompanies universal popularity. On the hundredth anniversary of his birth, in 1859, a "Schiller fund," amounting to several hundred thousand dollars, was created in Germany, and the annual income is devoted to the assistance of needy authors, some fifteen or twenty of whom are now wholly or partially supported from this source. All the principal cities of Germany have erected statues in his honor. The unselfish devotion of his life to his art is recognized with a fervor which takes no note of his early irregularities; and without ever having made the slightest profession of democracy he is everywhere celebrated in Germany as the poet of the people. The explanation of this fact must be sought for in the sincerity of his nature, no less than in the persecution of which he was temporarily the object. Carlyle finely says of him: "He was a high ministering servant at truth's altar, and bore him worthily in the office he held."

Düntzer, *Schillers Leben* (1881); O. Brahm, *Schiller* (1888); J. Minor, *Schiller* (1890); Jacob Grimm, *Rede auf Schiller* (1859); Fr. Vischer, *Rede auf Schiller* (1859); Kuno Fischer, *Schillers Schriften* (1891).

of his contemporaries to the beauties of Old Germanic poetry, and by his letters on art in the *Europa*, a periodical which he edited while in Paris, he caused a revival in the plastic arts of Germany. But he is also, especially during the last period of his life, the chief representative of the pernicious elements of romanticism. He advocated the re-establishment not only of the papal hierarchy, but also of mediæval feudalism, and the injurious effects of his and his associates' influence in this direction were only gradually overcome. See R. Haym, *Die romantische Schule* (1870); W. Dilthey, *Schleiermacher* (1870); I. Minor, *Fr. Schlegels prosaische Jugendschriften* (1882). JULIUS GOEBEL.

**Schleicher**, shli'cher, AUGUST: comparative philologist; b. at Meiningen, Germany, Feb. 19, 1821; studied theology and comparative philology at Leipzig, Tübingen, and Bonn 1840-46; privat docent in science of language at Bonn 1846-48; newspaper correspondent in Austria 1848-50; appointed Assistant Professor of Comparative Philology at Prague 1850; Professor of Science of Language and Teutonic Philology at Jena from 1857; died at Jena, Dec. 6, 1868. His residence at Prague directed his interest toward the Slavic languages, which, with the related Baltic languages, became from that time central in his scientific work and interest. Though his favorite thesis, that the science of language is to be classed among the natural sciences, has not been maintained, the influence of his views has been powerfully felt in checking arbitrary empiricism and establishing stricter methods of investigation. Chief works: *Die Sprachen Europas* (Bonn, 1850); *Formenlehre der kirchenslav. Sprache* (1853); *Handbuch der litauischen Sprache* (2 vols., Prague, 1856-67); *Die deutsche Sprache* (Stuttgart, 1860); *Compendium der vergl. Grammatik* (Weimar, 1862; 4th ed. 1876); *Laut- und Formenlehre der polabischen Sprache* (St. Petersburg, 1871). BENJ. IDE WHEELER.

**Schleiden**, MATTHIAS JAKOB: botanist; b. in Hamburg, Germany, Apr. 5, 1804; first studied law at Heidelberg, then medicine at Göttingen, and finally botany at Jena, where he was appointed professor in 1839. In 1862 he resigned his office, and after a short stay at Dorpat (1863-64) as Professor of Vegetable Chemistry, he settled at Dresden. His principal works are *Grundzüge der wissenschaftlichen Botanik* (2 vols., 1842-49), which attracted much attention and gave rise to many controversies; it was translated into English by Dr. Lankester (1849); *Die Pflanze und ihr Leben*, translated into English by Prof. Hentfrey (1848); *Baum und Wald* (1870); *Die Rose* (1873). D. at Frankfurt-on-the-Main, June 23, 1881.

**Schleiermacher**, shli'er-maäh-er, FRIEDRICH ERNST DANIEL: theologian and philosopher; b. at Breslau, Germany, Nov. 21, 1768; the son of a Reformed clergyman; was brought up in the community of Moravian Brethren, receiving a profound religious impulse from them. From 1783 to 1787 he attended the pädagogium at Niesky and the seminary of the United Brethren at Barby. He completed his theological course at Halle, and after filling the positions of private tutor, assistant preacher, etc., became in 1796 the chaplain of the Charity Hospital at Berlin; in 1802 court chaplain at Stolpe, and in 1804 Professor (*extraordinarius*) of Theology and Philosophy at Halle. In 1809 he preached at the Trinity church in Berlin, and the following year received appointment as Professor (*ordinarius*) of Theology at the new University of Berlin, which position he retained till his death. During the ten years previous to going to Berlin he had studied and criticised the Kantian philosophy, and was greatly attracted by Jacobi's exposition of Spinoza. He subsequently studied and translated Plato, and did much by his lectures to encourage the study of the remains of the early Greek philosophy. His activity knew no limits. He labored to effect a union of the Lutheran and Reformed Churches on the broad basis that demanded unity in the spirit of Protestantism and allowed diversity as to doctrines and modes of worship. His failure in this led to a misunderstanding with Minister von Altenstein, which lasted for some years. D. in Berlin, Feb. 12, 1834.

The fundamental point of view of Schleiermacher's system is this: Religion is not a knowing nor a doing, but a feeling—a feeling of the universal life of the Infinite, and of the dependence of the Ego upon it. Hence, with him, religion begins with the feeling of dependence. Reflection upon this feeling gives rise to descriptions of it, and hence the statement of religious principles and dogmas. All religions are historic and positive. Among these Christianity holds a unique place, inasmuch as in it is found the recon-

ciliation with the Infinite, hence the very essence of religion itself. Upon the same framework of antithetic ideas of the universal and particular (infinite and finite, common and special, God and the Ego) he builds his system of ethics. The organizing activity of reason in the realm of the common or universal, securing identity of common usage, is the first province of ethical action—that of interchange among men. The second is that of organization in the realm of particular individuality, the province of inalienable personality. The third and fourth provinces of ethical action are not those of organization, but of "symbolism," the third being that of symbolism with identity in the realm of thought and language, and the fourth the symbolism with individuality in the realm of feeling. Corresponding to these four provinces are the four institutions: (a) State, in which each is for the whole; (b) civil society, organized for the benefit of the individual; (c) school (college, etc.), for community of culture; (d) church, "for individual symbolic activity." The most important of Schleiermacher's writings are: (1) *Discourses on Religion* (Berlin, 1799); (2) *Monologues* (1800); (3) *Confidential Letters on F. Schlegel's Lucinde* (1800); (4-7) *Four Collections of Sermons* (1801-20); (8) *Outlines of a Critique of Previous Systems of Ethics* (1803); (9) *Translation of Plato's Works* (1804-28); (10) *The Christian Faith according to the Principles of the Evangelical Church* (1821-22); (11) *Theological Encyclopædia* (1811). After his death were published (1835) lectures on the history of philosophy, dialectics, psychology, ethics, politics, and pedagogics. The lectures on the life of Jesus, which appeared in 1864, made an epoch when first delivered. According to the authority of Zeller, Schleiermacher is the greatest theologian of the Protestant Church since the period of the Reformation—"a churchman whose liberal ideas will yet prevail in regard to the union of Protestant confessions, the constitution of the Church, and the rights of conscience and individuality in religion"—"a deep-working religious teacher, who formed the heart by the understanding and the understanding by the heart—a philosopher who scattered fruitful seeds, who introduced a new era in the knowledge of Greek philosophy, and who assisted in Germany's political regeneration." He investigated the nature of religion more profoundly than any before him. Physically, he was small of stature, slightly deformed, quick and animated in his movements, his countenance kind and sympathetic. His *Autobiography* (covering only the first twenty-six years of his life) was published in 1851. His *Correspondence with J. C. Gass* appeared the following year in 4 vols. His *Biography* has been written by K. Schwartz, D. Schenkel, W. Dilthey, and others. WILLIAM T. HARRIS.

**Schleitz**, shli:ts: town of Reuss (younger branch), Thuringia, Germany, and residence of the reigning family; 24 miles S. S. W. of Gera, terminus of a branch railroad from Schönberg; elevation, 1,407 feet (see map of German Empire, ref. 5-F). It is well kept, has beautiful streets, tanneries, a foundry, factories of lamps, whips, and lace; also a college and schools for teachers, for deaf mutes, and for wood-carving. Near by is the château of Heinrichsruh. Pop. (1890) 4,928. M. W. H.

**Schleswig**, shles'wich (i. e. Bay of the Schlei): district and town of the southern part of the Danish peninsula (see map of German Empire, ref. 2-E). The district was a Danish province until 1864, when it was taken by Prussia by conquest and united two years later with Holstein to form the province called Schleswig-Holstein. The town is at the end of a slender arm of the Baltic Sea, which penetrates nearly half-way across the peninsula and is called the Schlei. Schleswig is an ancient town, was known to the Arabian geographers, and by 800 was a place of considerable commercial importance. This continued during the Middle Ages, but eventually the removal of the ducal residence, the rivalry of Lübeck and Kiel, and the silting up of the mouth of the Schlei caused its trade to decline, and it remained only of strategic interest, which, however, was lost as a result of the war of 1864. Southwest from the town are the traces of the Danewerk, a line of intrenchments connecting the Schlei with the Treene, which flows westward and empties into the North Sea. It was thrown up in the ninth century, or earlier, and was intended for the defense of the peninsula. It was used for this purpose for ten centuries, and was repeatedly renewed and strengthened until it was abandoned in 1864 by the Danish army under Gen. de Mera without striking a blow. Pop. of town of Schleswig (1890), 15,123. MARK W. HARRINGTON.

**Schmid, LEOPOLD**: cleric; b. at Zurich, June 9, 1808; studied theology at Tübingen and Munich; became professor in the priest seminary at Limburg 1831, and Professor of Theology in 1839 at Giessen. Although a strict adherent of the Roman Catholic Church, his broader and more liberal views, acquired by an extensive study of philosophy, brought him into collision with the ultramontane party. In 1849 his election as Bishop of Mentz was not confirmed by Pope Pius IX., who, however, dared not place his book, *Der Geist des Katholicismus oder Grundlegung der christlichen Irenik* (2 vols., Giessen, 1848-50), in the *Index*. The papal action led him to leave the theological and enter the philosophical faculty at Giessen. His little pamphlet *Ultramontan oder katholisch?* (1867) indicated his renunciation of the Roman Catholic Church. D. at Giessen, Dec. 20, 1869.

**Schmidt, shmit, FREDERICK AUGUSTUS**: theologian; b. at Leutenberg, Thuringia, Jan. 3, 1837; emigrated to the U. S. in 1841; educated in Concordia College and Seminary, St. Louis, Mo.; pastor Erie co., N. Y., and St. Peter's English church, Baltimore, Md.; entered the service of the Norwegian Synod in 1861; professor at Decorah, Ia., 1862-72; professor in Theological Seminary, St. Louis, Mo., 1872-76, at Madison, Wis., 1876-86, Northfield, Minn., 1886-90, Minneapolis since 1890. Dr. Schmidt was a chief opponent of Dr. Walther in the controversy on the subject of predestination that agitated the Synodical Conference, establishing and editing for this purpose the *Altes und Neues* (1880-85). H. E. JACOBS.

**Schmidt, HEINRICH JULIAN**: journalist and author; b. at Marienwerder, Prussia, Mar. 17, 1818; studied philology and history at the University of Königsberg; settled in 1847 at Leipzig as editor, afterward in connection with Gustav Freytag as proprietor of the *Grenzboten*, which supported the Prussian interest in Germany; removed in 1861 to Berlin and edited the *Berliner Allgemeine Zeitung* 1861-63; d. in Berlin, Mar. 26, 1886. Author of *Geschichte der Romantik im Zeitalter der Reformation und Revolution* (2 vols., 1850); *Geschichte der deutschen Literatur seit Lessings Tod* (3 vols., 1858); *Geschichte des geistigen Lebens in Deutschland von Leibniz bis auf Lessings Tod* (2 vols., 1860-64); *Bilder aus dem geistigen Leben unserer Zeit* (1870); *Geschichte der deutschen Literatur von Leibniz bis auf unsere Zeit* (1886). He was a much-dreaded critic, hostile to morbid romantic tendencies, and advocated healthy realism in poetry. See G. Freytag's *Erinnerungen aus meinem Leben* (1886). J. G.

**Schmidt, HENRY IMMANUEL, S. T. D.**: educator; b. at Nazareth, Pa., Dec. 21, 1806, where he was educated, and afterward taught 1826-29; Lutheran pastor, Bergen co., N. J., 1831-33, Boston, Mass., 1836-38, Montgomery co., Pa., 1844; professor at Hartwick Seminary, New York, 1833-36, Pennsylvania College and Theological Seminary, Gettysburg, Pa., 1838-43; principal of Hartwick Seminary 1845-47; Professor of German Language and Literature in Columbia College, New York, 1848-80. D. in New York, Feb. 11, 1889. He published *History of Education* (New York, 1842); *The Lutheran Doctrine of the Lord's Supper* (1852); *Course of Ancient Geography* (1860). H. E. JACOBS.

**Schmidt, JOHANNES**: comparative philologist; b. at Prenzlau, Prussia, July 29, 1843; educated at the Marienstifts Gymnasium in Stettin and at the Universities of Bonn and Jena; docent in Comparative Philology at Bonn 1868; assistant professor in Bonn 1873; autumn of same year professor in Graz; since 1876 Professor of Comparative Philology in Berlin; member of the Royal Prussian Academy. Author of *Zur Geschichte des indogerm. Vocalismus* (1871-75); *Die Verwandtschaftsverhältnisse der indogerm. Sprachen* (1872); *Die Pluralbildungen der indogerm. Neutra* (1889); *Die Urheimath der Indogermanen und das europäische Zahlssystem* (1890); also important articles in *Kuhn's Zeitschrift für vergleichende Sprachforschung*, of which since 1875 he has been coeditor with E. Kuhn. In wide and accurate scientific acquaintance with the details of the grammatical structure of the Indo-European languages he is unexcelled by any living scholar. BENJ. IDE WHEELER.

**Schmidt-Rimpler, HERMANN, M. D.**: ophthalmologist; b. in Berlin, Prussia, Dec. 30, 1838; graduated M. D. at the University of Berlin in 1861; was a military surgeon for some years, and after 1871 was brigade-surgeon at the Frederick William Institute; at that time he was appointed Extraordinary and in 1873 Ordinary Professor of Ophthalmology at the University of Marburg; in 1891 he accepted

the same chair at the University of Göttingen. His chief work, *Augenheilkunde und Ophthalmoskopie für Aerzte und Studierende* (Brunswick, 1885), has passed through several editions and has been translated into several European languages. S. T. ARMSTRONG.

**Schmucker, BEALE MELANCHTHON, D. D.**: clergyman and author; son of Samuel S. Schmucker; b. at Gettysburg, Pa., Aug. 26, 1827; graduated at Pennsylvania College and Theological Seminary, Gettysburg, Pa.; pastor at Martinsburg, Va., 1845-51, Allentown, Pa., 1852-62, Easton 1862-67, Reading 1867-81, Pottstown 1881-88. D. at Pottstown, Oct. 18, 1888. He was especially distinguished as a liturgical scholar and writer, being unexcelled in this department in the U. S. *The Church Book* (1867, 1892) of the General Council and *The Common Service* (1888) of all English-speaking Lutherans owe more to his indefatigable labor and investigations than to any one else. The American edition of the *Hallesche Nachrichten* was edited by him, with Dr. Mann and Dr. Germann, and furnished with exhaustive historical notes. He was secretary of the General Council's committee on foreign missions 1869-88, and secretary of the board of directors of the Theological Seminary, Philadelphia, from its founding in 1864 until his death. H. E. JACOBS.

**Schmucker, SAMUEL SIMON, D. D.**: theologian; b. at Hagerstown, Md., Feb. 28, 1799; educated at the University of Pennsylvania and Princeton Theological Seminary; pastor at New Market, Va., 1820-26; professor in Theological Seminary, Gettysburg, Pa., 1826-64. D. at Gettysburg, Pa., July 26, 1873. Schmucker represented the American Lutheran type of theology, as he termed it, which was characterized by indifference to the distinctive doctrines of the Lutheran Church. He advocated this tendency in his *Elements of Popular Theology*, first published in 1834; *American Lutheran Church* (1851); *Lutheran Manual* (1855); *Lutheran Symbols, or American Lutheranism Vindicated* (1856); *Church of the Redeemer* (1867), besides in numerous articles in the reviews and church papers. He wrote *The Definite Synodical Platform* (1856), as an American recension of the Augsburg Confession to be adopted by the synods of the General Synod, in which the Lutheran doctrines of original sin and the sacraments were greatly modified. He also labored in the cause of Church union, and was one of the founders in 1846 of the Evangelical Alliance. H. E. J.

**Schneider, JOHANN GOTTLIEB**: classical scholar; b. at Collmen, near Wurzen, Saxony, Jan. 18, 1750; began his philological studies at Schulpforta, which he continued at Leipzig, and at Göttingen under Heyne, who recommended him to Brunnck at Strassburg to aid the latter in his edition of the Greek poets. Here he added to his classical studies that extensive and thorough acquaintance with anatomy, botany, and zoölogy which gave so great value to his editions of the ancient authors who treat of those subjects. In 1776 he was appointed Professor of Ancient Languages and Eloquence in the University of Frankfurt-on-the-Oder. When, in 1811, the university was removed to Breslau, he accompanied it, holding the same office, which he resigned in 1816 on his appointment as chief librarian. Of the many valuable editions published by him may be mentioned: *Scriptores Rei Rusticæ* (4 vols., 1794-95); *Vitruvius* (3 vols., 1807-08); *Aristotle's Historia de Animalibus* (4 vols., 1812); *Works of Theophrastus* (5 vols., 1818-21); *Ælian, De naturali animalium*; *Nicander's Alexipharmaca and Theriaca*; and *Orpheus's Argonautica*. On his large *Griechisch-Deutsches Wörterbuch* (2 vols., 1797-98; 3d ed., with supplement, 1819-21) Passow based his lexicon. D. at Breslau, Jan. 12, 1822. Revised by A. GUDEMANN.

**Schneider, KARL ERNST CHRISTOPH**: classical scholar; b. at Wiehe, Prussian Saxony, Nov. 16, 1786; studied theology and philology at the University of Leipzig; in 1816 appointed Professor of Ancient Literature in the University of Breslau; published *De Originibus Tragædiæ* (1818); edited, with a critical commentary, *Plato's Republic* (3 vols., 1830-33; supplement, 1854); German translation of same (*Platon's Staat*), of the *Timæus* (1847), and an edition of Proclus's *Commentarius in Platonis Timæum* (1851); *Cæsar's Commentarii de Bello Gallico* (2 vols., 1840-55), with elaborate commentary; edited a portion of the *Plato in Didot's Bibliotheca Græca* (Paris, 1846-53). D. at Breslau, May 16, 1856. Revised by A. GUDEMANN.

**Schneidewin, FRIEDRICH WILHELM**: classical scholar; b. at Helmstedt, Brunswick, June 6, 1810; entered the Uni-

relatively to one another. It would be unjust to tax them with their shortcomings in history and the natural sciences; those elements of human learning they borrowed from their predecessors, and they were too busy as pioneers of a mighty intellectual movement, as the schoolmasters of the young nations, to devote attention to special and minor departments of the world of knowledge, even if their value were as clear to them as to us. To one of these schoolmen, Vincent of Beauvais, we owe the famous *Speculum*, forerunner of our modern encyclopædias, in which the divisions of human science and their respective claims are justly observed and recognized. Withal, Albert the Great and Roger Bacon recognized fully the bearings of the study of nature, and the great moral poem of Dante is a study in social and political questions of the highest order. The annalists, chroniclers, and historians of the time, themselves schoolmen or trained in the schools, show an ever-widening interest in human affairs, much shrewdness, a large extent of observation, and a well-developed political sense. It may also be noted that even in the schools during the latter half of the twelfth and in the thirteenth century the technical and oratorical styles were in a constant struggle for the mastery, a phase of this movement which is well illustrated by the contemporary Alexander of Hales and William of Paris, the former representing the didactic and the latter the larger, more rhetorical manner. A glance at the weighty philosophical problems which constantly attracted the attention of the schoolmen is sufficient to impress a frank, intelligent mind with respect. They were the relations of faith and reason; the nature and means of knowledge; the reality of observations, phenomena, experience; the personality of man; the nature of the universe, immortality, the future life; the rights and duties of the factors of society, the forms and functions of government, etc. And all this, not in a loose, inconsistent, contradictory manner, but with logical coherency, and a consciousness that they were contributing in a systematic way to the creation of a great whole in which faith and reason have each the share that is demanded by the peculiar nature and office of each. The most perfect specimen of this philosophic spirit is St. Thomas Aquinas, and the most admirable of the scholastic works is the *Summa Theologica* of that stupendous genius—"a vast encyclopædia of the moral sciences, in which whatever could be known of God and man and their relations was set down; a monument severely harmonious, magnificent in design, but yet unfinished, like so many other of the great mediæval undertakings." (*Ozanam*.)

*Sources of Scholasticism.*—Inasmuch as this term implies a rounded and consistent body of doctrines, it sums up all previous knowledge of a higher order, and draws upon all the fountains of human learning then known. In theology the written word of God, the decisions of councils and popes, the writings of the Fathers, Church history, canon law, the liturgy, and popular religious custom and feeling, furnish the materials of the scholastic writings. In philosophy Aristotle, as known to the Middle Ages, with Boethius and the pseudo-Areopagite, form the sources of their logic and metaphysics. The schoolmen accepted without question the teachings of the Church, and proceeded to co-ordinate them by means chiefly of the Aristotelian method and principles, to illustrate, explain, and defend, to reduce the propositions of theology to formal theses, against which they marshaled all possible objections, which were answered briefly and in order, but not before the theological truth in question had been defined and proved. Thus theology grew under their hands into a perfect science, with the aid of the dialectic method, and all the teachings of the Catholic Church were built up as into a vast edifice, which had its vestibule or preparation in natural theology, its framework in the revealed and defined truths of religion, its roof or completion in their orderly presentation by the schoolmen, and its decoration in the countless services rendered by human reason to the entire process.

*The Processes of Scholasticism.*—The doctors of the schools wrote usually on two distinct lines. Sometimes they composed independent, original writings, and thus arose their sums of theology, their controverted and so-called quodlibetal questions. Again, they wrote commentaries on some favorite work, like the Bible, the pseudo-Areopagite, Boethius, Peter Lombard, or Aristotle. In either case they usually divided their subject-matter into parts, which were in turn subdivided into questions and articles—the bulk of the doctrine being always given in the latter, and the outlines furnished by the titles or theses placed at the head of each division and subdivision. Each article opened with a series

of formal objections, after which the doctrine, theological or philosophical, was stated, and the sufficient grounds for it assigned, whereupon the answers to the objections followed. Clear statement, compressed sentences, close dialectic reasoning, frequent fine distinction, and a sharp insistence upon the point at issue mark these brief treatises of theology, which were as pleasing to the mediæval mind as the dialogue was to that of the Greek. There is in the writings of the best of the schoolmen a magnificent play of reason, which recoils before no difficulty, reminding us often of certain wonderful feats of skill that the contemporary architects successfully attempted. Before them there had been theologians without number, and scarcely a point in theology had been left untouched. But they created the science of theology; they impressed the most rational of philosophies into its service; they mapped out all the multiplex relations between God and man, and in all this they preserved a certain free and speculative spirit, with minds turned habitually toward investigation, and, within certain limits, filled with an insatiable curiosity.

*History of Scholasticism.*—The origins of this method or system are not to be found in a sudden discovery and adaptation of the philosophy of Aristotle; they are as old and as deep as those of other great phenomena of the time. The philosophy of Aristotle had been handed down through Boethius, and that of Plato through the pseudo-Areopagite. Ecclesiastical science had found numberless exponents, from Bede and Isidore of Seville down to the meager annalists and collectors of canons in the darkest years of the tenth century. The rational and scientific presentation of theological truths had been happily performed by many writers long previous to the rise of what is known as scholasticism. Usually, however, its history is said to begin with St. Anselm of Canterbury (1033-1109), in whose *Monologium* the outlines of the scholastic dialectic method are distinctly visible. Abelard, William of Champeaux, Roscelin, Peter Lombard, the Blessed Albert the Great, St. Thomas Aquinas, St. Bonaventure, and Duns Scotus mark its progress to the end of the thirteenth century, which was its true apogee, and in which its highest exponents were the Blessed Albert the Great, St. Thomas, and St. Bonaventure. Their theological systems are at once complete and grandiose, and awaken forever the astonishment of dispassionate students, for the keen, searching analysis of details, the regular proportions of the parts, and the successful boldness with which they are fitted together, and resist all antagonizing forces. Other great doctors of this brilliant period were Alanus of Lisle, Alexander of Hales, Henry of Gant, Richard Middleton, Peter of Poitiers, William of Paris, etc. From an early date, however, divergent currents and tendencies, arising from various sources, made themselves visible. Thus the Dominicans and Franciscans represented opposing views in theology and philosophy, and again within each great body there were fresh clefts. The second period of scholasticism covers the fourteenth and fifteenth centuries, and is marked by a tendency on the one hand to free philosophy and the other sciences from their ancillary dependence on theology, and on the other to gather from the latter all possible benefit for the practical, ascetic, spiritual needs of the soul, as opposed to the purely scientific satisfaction of the intellect. Thus the differentiation of the sciences (Roger Bacon, Raymond Lull) and the growth of mystical theology as a specific branch (Master Eckhart, Tauler, Suso, Ruysbroeck, Thomas à Kempis, the "German Theology") divide with theology proper the interest of students in this second age. It was inevitable that the succession of men like St. Thomas and St. Bonaventure should fall upon weaker shoulders, and several other circumstances combined to hasten the decline of the great intellectual movement of the thirteenth century. The Western Schism, the Franciscan controversies, and the political changes drew men's minds more to practical immediate interests, and the cultivation of dogmatic philosophy and theology was neglected for moral and legal questions. It is the age of the moralists and jurists, of the commentators on the law of the Church, and the civil law. Durandus, Occam, Pierre d'Ailly, Gerson, Capreolus, Denys le Chartreux, Gabriel Biel, and Thomas of Strassburg represent this later and weaker stage of scholasticism, previous to the Reformation.

*Neo-scholasticism.*—As the theology and philosophy of the mediæval schools were not a sudden and foreign importation, but the natural outgrowth of the previous literary movement, so the true Catholic theology and philosophy of

**Schönebeck**: town; in the province of Saxony, Prussia; on the Elbe; 9 miles by rail S. of Magdeburg (see map of German Empire, ref. 4-F). It has large salt-works, breweries, and distilleries, and manufactures of powder, chemicals, soap, white lead, and vinegar. It suffered much from an inundation in Feb., 1876. Pop. (1890) 14,189.

**Schönfeld, Edward**: astronomer; b. at Hillburghausen, Saxe-Meiningen, Germany, Dec. 22, 1828; became an assistant to Argelander at the University of Bonn, where he took an active part in cataloguing all the stars of the northern hemisphere, down to the ninth magnitude. In 1875 he succeeded Argelander as director of the Bonn Observatory and Professor of Astronomy. In 1889 he received the Watson medal from the National Academy of Sciences at Washington for his work in cataloguing the stars. D. at Bonn, May 1, 1891. S. N.

**Schoolcraft, Henry Rowe**, LL. D.: ethnologist; b. at Watervliet (now Guilderland), N. Y., Mar. 28, 1793; studied at Union and Middlebury Colleges; devoted himself to a scientific study of the art of glass-making, his father being a manager of extensive glass-works; began the publication at Utica in 1817 of a work on *Vitreology*, which was left incomplete through lack of patronage; made a journey through the mineral regions of Southern Missouri and Arkansas in 1817-18, of which he published an account, *A View of the Lead-mines of Missouri* (New York, 1819); obtained from Secretary Calhoun in 1820 an appointment as geologist to an exploring expedition sent to the upper Mississippi and Lake Superior copper region, and published a *Journal* (1821); was in 1822 appointed Indian agent for the tribes of Lake Superior; was the principal founder of the Michigan Historical Society (1828) and of the Algic Society of Detroit (1831), an association for the investigation of Indian antiquities; was at the head of a scientific expedition which in 1832 explored for the first time Lake Itasca and the sources of the Mississippi; negotiated in 1836 a treaty by which the U. S. purchased from the Chippewas a tract of 16,000,000 acres on the upper lakes, after which he became superintendent of Indian affairs for the northern department, and in 1839 chief disbursing agent for the same department; published *Algic Researches* (2 vols., 1839), a collection of Indian tales and legends; removed to New York 1841; issued the prospectus of an *Indian Cyclopædia* (1842), afterward carried into effect in another form; superintended at Washington the publication of a series of reports on all the Indian tribes of the U. S. (6 vols., illustrated, Philadelphia, 1851-57), containing material of great value, but unsatisfactory as a whole from lack of systematic arrangement and from unwarranted theorizing. D. at Washington, D. C., Dec. 10, 1864. Among his numerous publications were a *Narrative of an Expedition to Itasca Lake, the Actual Source of the Mississippi* (1834; reissued in 1853, along with the account of the earlier exploration of 1820); *Oncleas, or Characteristics of the Red Race of America* (New York, 1844); *Notes on the Iroquois* (Albany, 1848); *Personal Memoirs of a Residence of Thirty Years with the Indian Tribes* (Philadelphia, 1851); and *Scenes and Adventures in the Semi-Alpine Regions of the Ozark Mountains* (1853).

Revised by J. W. POWELL.

**Schoolmen**: those philosophers of the Middle Ages whose labors were directed chiefly to adjusting the relations of the Christian religion to philosophy. See **PHILOSOPHY** (*History of Philosophy*), **NOMINALISTS**, **REALISM**, and **SCHOLASTICISM**.

**Schools**: collections of persons brought together and duly organized for the purpose of imparting and receiving instruction. The word school is commonly applied to an organization intended to provide elementary, secondary, or professional instruction, and not to an institution designed to offer exclusively non-professional studies of college or university grade. Thus we have elementary schools, secondary schools, normal schools, trade schools, theological schools, law schools, and medical schools, each group of which is treated below. See also **AGRICULTURAL COLLEGE**, **COLLEGE**, **COMMON SCHOOLS**, **KINDERGARTEN**, **MANUAL TRAINING**, **MILITARY ACADEMIES**, **UNIVERSITY**, etc.

#### I. HISTORICAL DEVELOPMENT OF SCHOOLS.

**The Orient.**—In India schools for the instruction of boys have existed from time immemorial. These were held in the open country, under the shade of trees, or, in case of bad weather, under primitive roofs. Exercises were first performed on the sand, then on palm-leaves with a stylus, and finally with ink. Among the Israelites great care was taken to instruct

the children, but until the Christian era, so far as is known, such instruction was limited to the family. In the year 64 A. D., however, the high priest Gamala decreed that each town should support a school under pain of excommunication. As given in the Talmud, if the number of children did not exceed 25, the school should be conducted by one teacher; if more than 25 and less than 40, there should be an assistant; if more than 40, there should be two masters. The Talmud describes in detail the duties of the teacher and the obligations of the pupil, showing conclusively that great reliance was placed by the Jews upon the effects of the training effected by the schools. Corporal punishment was inflicted only for children above the age of eleven. "After the age of six receive the child and load him like an ox." "Children should be punished with one hand and caressed with two." In case of disobedience the pupil might be deprived of food and even "struck with a strap of shoe-leather." In China the necessity of the most thorough provision for schools was inculcated by Confucius. The philosophy of the country demanded the most complete knowledge possible of the methods and characteristics of the fathers. To this end the provisions for education were systematic and universal. Huc, the famous missionary and traveler, declares that of all countries it is in China that primary instruction is most widely diffused, and another missionary asserts that "there is not a village so miserable, nor a hamlet so unpretending, as not to be provided with a school." When Japan adopted Chinese civilization, it adopted the Chinese school system, which continued until the opening of the country to European and American influences. In 1872 a law was passed providing for an elementary school for every 600 of the population. This law has been very generally carried out, and the benefits derived from it have been very great. In Egypt intellectual culture reached a very high point, but education was confined almost exclusively to the priestly caste, which guarded jealously all the sources of knowledge. Here, therefore, as in the other contemporaneous nations, schools were only imperfectly developed.

**Greece.**—The necessity of education in the most comprehensive sense was universally recognized among the Greeks, but schools were private and not subject to governmental supervision. The Athenian lad was put under a pedagogue (a conductor of boys, usually a slave), who took him at an early age to a *palestra* or primary school. Here the boy was taught gymnastics, reading, writing, mythology, and especially music. Homer was universally the boy's reading-book. From the *palestra* the pedagogue took his pupil to the gymnasium or secondary school. Here, as in the *palestra*, special attention was given to music, as a means of inspiring the soul with a love of harmony and order. Grammar and rhetoric were also taught. From the gymnasium the pupil either betook themselves to their several vocations or, in case of special ambitions, continued their studies in the schools of the sophists or under personal private instruction. It was to such pupils that Socrates, Plato, and Aristotle gave instruction. In the *Republic* and the *Laws* of Plato and the *Politics* of Aristotle the Greek ideas of education are set forth. The prevailing thought was the harmonious development of all the powers of the pupil, physical, mental, and moral. In Sparta education was regarded as equally important, but here special stress was placed upon the training of men physically for military duty.

**Rome.**—With the Romans education manifested two somewhat distinct types. During the republic it inclined to the Spartan, during the empire to the Athenian. Before the second Punic war no provision was made for schools, but education was limited to the care of the family. Under the empire a severe family discipline, coupled with the Roman ideals as to the civic and military virtues, succeeded in developing a remarkable race of men. With the introduction of a taste for Greek arts and literature in the third century B. C. the era of severe simplicity gradually gave way to new ideals. Schools of philosophers and rhetoricians came into existence, and the younger children were intrusted, as at Athens, to the care of pedagogues. But even under the empire education was not taken up as an affair of the state; each teacher followed his own method. Varro wrote of grammar, rhetoric, history, and geometry, and his works had much influence for several generations. Of more importance were the *Institutes of Oratory* by Quintilian, who gives a detailed account of the ideal education of an orator from the earliest childhood to manhood.

**Middle Ages.**—During the period of the invasions the pro-

railing turbulence made the establishment of schools impossible. Even the Christian Fathers were divided in their opinions as to the influence of a comprehensive education. Tertullian rejected all pagan learning, and St. Augustine, after his conversion, renounced his taste for classical poetry and eloquence. St. Basil, on the other hand, recommended that young Christians become familiar with the orators, poets, and historians of antiquity; and St. Jerome wrote a treatise on the education of girls which has elicited warm commendation. But the ideas of the time were monastic in their nature, and early monasticism was unfavorable to the establishment of schools of any kind. Here and there groups of young Christians, aspiring to the priesthood, gathered around the priest for instruction, but these were scarcely worthy the name of schools. Sidonius Apollinaris, writing in the fifth century, says: "Teachers no longer have pupils, and learning languishes and dies." It was not till the age of Charlemagne that an attempt was made to provide for systematic instruction. This great ruler not only established a kind of itinerant school, which followed the king on his travels, with Alcuin at its head, but he decreed the establishment of schools in various parts of his domain. Nothing gives a more depressing picture of the intellectual feebleness of the time than the description of the methods of instruction contained in Einhard's *Vita Caroli Magni*. (See Guizot, *History of Civilization in France*, lect. xxii.) Thus, notwithstanding the enlightened efforts of Alcuin, who has aptly been called the first minister of education in France, neither the clergy nor the people by their intelligence or their appreciation responded to the efforts that were put forth. No one of Charlemagne's successors took up his thought, and the Council of Aix-la-Chapelle, in 817, decided that no more day-pupils should be admitted to the conventual schools. It was not till the twelfth century that SCHOLASTICISM (*q. v.*), by the introduction of the Aristotelian processes of reasoning, awakened some intellectual activity. But even this was chiefly a mental gymnastic, and gave distorted views of all the affairs and relations of life. The fact that Abelard by the renown of his eloquence could gather about him in Paris thousands of students shows that there was an interest in learning, which, under wise, inspiring, and systematic guidance, might perhaps have accomplished important results. But no such guidance was at hand. It was not till that general awakening called the Renaissance that schools of any considerable importance were established. There were, it is true, ecclesiastical schools for the education of priests, but their methods were crude and their results narrow and distorted. In 1363 choirs and benches were forbidden, because they encouraged pride. The rod was freely used. "Day and night," wrote an abbot to Anselm, "we do not cease to chastise the children, but they grow worse and worse." "In the fifteenth century," says Montei, in describing the schools, "the rods are twice as long as those in the fourteenth." But it would be erroneous to suppose that the conditions generally prevalent in Europe were universal. On the contrary, after the rise of Mohammedanism in the seventh century, schools were established in all the principal cities in the East as well as in the West. The most celebrated were at Bagdad, Damascus, Cordova, Salamanca, and Toledo. Here grammar, philosophy, chemistry, medicine, and the various branches of mathematics were studied with great success. They gave algebra and trigonometry their modern forms, determined the size of the earth by measuring a degree, made a catalogue of stars, invented the pendulum clock, and discovered alcohol, as well as nitric and sulphuric acids. Their schools were largely attended by the most enterprising and aspiring youth of the other countries of Europe, and their influence was considerable in awakening the thought which led to the Renaissance.

**The Revival of Learning.**—It is of importance to note that the first general intellectual movement of modern Europe was through the universities. Cambridge, Oxford, Bologna, Salerno, Naples, Paris, Prague, Vienna, and Heidelberg were established before the beginning of the fifteenth century. The moral and intellectual tone of the universities was low, but their influence in behalf of learning soon made itself felt. Students had special halls or colleges in which they lodged and boarded under official superintendence. At first the universities were free associations, but they were soon recognized as elements of power by the Church and the rulers, and soon received special privileges. Before the end of the twelfth century contemporary authorities assert that at the University of Bologna there were 12,000 students and

a little later that at Paris there were 20,000. These were grouped into four faculties—those of theology, philosophy, law, and medicine, the classification which is still prevalent in Germany. During this period schools were greatly assisted by the writings of the most enlightened teachers. Besides Abelard (1079–1142), Gerson, chancellor of the University of Paris (1363–1429), Vittorino da Feltre of Padua (1379–1446), and Aeneas Silvius, afterward Pope Pius II. (1458–64), contributed greatly to improve the methods and spirit of instruction. In the secondary schools, which were mostly conventual, "the seven liberal arts"—viz., Latin, grammar, dialectics, rhetoric, music, arithmetic, geometry, and astronomy—were regularly, though not very efficiently, taught.

**The Reformation.**—The great religious upheaval of the sixteenth century was heralded by a number of eminent teachers and patrons of learning. Manuel Chrysoloras collected a vast number of Greek MSS. and introduced them into Italy. Pope Nicholas V. founded the Vatican Library and made Rome the center of learning. Agricola not only transplanted the spirit of letters from Italy to Germany, but gave most valuable advice to those engaged in establishing schools. To the authorities at Antwerp inquiring for a head master, he wrote: "Take neither a theologian nor a rhetorician, but one who knows how to teach, to speak, and to act at the same time. If you know such a man get him at any price." Reuchlin created great enthusiasm for the study of Hebrew, and Erasmus performed a still higher service in behalf of Greek and of polite learning in general. The impulse thus given was carried on by Luther, whose doctrine of justification by faith alone transferred from the Church to the individual the responsibility of saving knowledge. The logical result was a great movement in behalf of the means by which individual knowledge could be increased. Luther not only advocated the establishment of schools everywhere, but he gave important advice in regard to their organization and improvement. His teachings wrought a veritable revolution. He pushed forward the art of giving instruction, and provided for special instruction of the best scholars to fit them for the work of teachers. While he put great stress on the study of theology, and gave a very prominent place to studies in Greek, Latin, and Hebrew, he recommended mathematics and history. He made the support of the schools a charge upon the public treasury, and placed upon the parents the moral obligation to send their children to school. Perhaps the most important of all was the fact that he insisted upon an absolute emancipation from the old spirit of exclusiveness, for it was in this emancipation that the revolution really consisted. The gist of his teachings in this respect was contained in these words: "The monks have imprisoned young men like birds in a cage. It is dangerous to isolate the young. It is necessary, on the contrary, to allow young people to hear, see, and learn all sorts of things, while all the time observing the restraints and the rules of honor." This new spirit became the fundamental idea of education in Germany, and it exerted a vast influence in giving German schools of all grades the pre-eminence they have ever since maintained. These fundamental propositions were given definiteness of form two generations later by the great father of educational organization, Comenius. Michelet calls him "the first evangelist of modern pedagogy—Pestalozzi being the second." His particular service was in giving exactness to different grades of instruction, in defining the most important laws in the art of teaching, in determining how elementary instruction should be conducted, and in applying to all grades of teaching the laws of modern logic. The classification of studies outlined in his different works, of which there were twenty volumes, was essentially the same as that generally adopted at the present day by the best schools of Europe and America. While the work of Comenius was going on in Germany, England, and Sweden, other efforts were put forth in different parts of Europe. In Geneva the ecclesiastical policy of Calvin provided for the establishment of schools and teachers. Melancthon drew up the "Saxony plan," which was long the basis of organization in many parts of Germany. In Strassburg the school of John Sturm became so famous that it was sought by pupils from all parts of Europe. In all Roman Catholic countries schools were organized in the most thorough manner under the direction of the Jesuits. The foundation of all the Jesuit schools was the study of the classics, but they taught also philosophy, ethics, mathematics, and history. At the beginning

of the eighteenth century the fame of the Jesuits as teachers had become so great that they had been called upon to establish schools in every part of the world. In 1710 they were reported to have 612 colleges, 157 schools for the education of teachers, and twenty-four universities. The system proposed by Loyola in 1588, with the exception of some slight modification made in 1832, has remained unchanged to the present day. Thus far the organization of schools since the Reformation has been largely shaped either by individual teachers or by general religious considerations.

**Germany.**—From the time of Comenius until the nineteenth century the schools of Germany were multiplied, but there was no very radical change in the plan of organization. In 1715 A. H. Francke founded the first *Pedagogium*, or normal school for the training of teachers, and his organizing and inspiring power was such as to bring together more than 4,000 teachers and pupils in the institutions under his control. Methods were still further improved by Basedow and Rochow, and both Frederick the Great and Maria Theresa gave practical encouragement to the schools by declaring them entitled to the protection and care of the state. Even the eccentric Frederick William I. of Prussia published an edict of compulsory education. But notwithstanding all these efforts, the elementary schools remained in wretched condition throughout the eighteenth century. It was not till after the Napoleonic wars had shattered Prussia (see NAPOLEON I., *Jena Campaign*) that thoroughgoing reform took place. The methods recommended by PESTALOZZI and FROEBEL (*qq. v.*) were then generally applied in the elementary schools, and all grades of instruction were subjected to the most systematic and rigid revision, as well as state control and state superintendence. In a most solemn address to the German people, Frederick William III. recognized the great part that education must play if the nation was to be developed in internal power and splendor. Educational affairs of all grades were intrusted to a department of education, consisting of four of the most eminent professors of Germany, at the head of whom was Wilhelm von Humboldt. Order was soon evolved out of the chaotic conditions that formerly prevailed. After tentative orders in 1811 and 1812, a general statute was promulgated in 1816 constituting the fundamental school law of Prussia. Although this great ordinance was in some of its parts modified by the Prussian Code of 1854, and again by the Falk Laws of 1872, its general characteristics were those which have made the schools of Prussia the most famous in the world during nearly the whole of the nineteenth century. The organization may be briefly described as follows: Schools were classified in four general groups—primary schools, secondary schools, universities, and technical schools. In the fourth class the normal schools were to occupy the place of foremost importance. No teacher was to be employed who had not, after a severe course of pedagogical training, passed a rigid examination, not only in the matter to be taught, but also in the art of giving instruction. Pensions were provided for teachers honorably retired. The hours of instruction for pupils in the lowest grades are twenty-two per week; in the highest, thirty-two. In the elementary and secondary schools the work is strictly prescribed; in the universities there is absolute freedom. By the Falk Law of 1872 the middle school was specially adapted to commercial requirements. In Prussia, which may be regarded as the model, all the schools are under the immediate supervision of thirty-six district boards or committees. The laws compel an attendance of pupils from six to fourteen years of age, and in case of deficiency even a longer time. In Prussia, Saxony, and Bavaria, small fees may be exacted of each pupil, but in the other states elementary instruction is free. In all the German states the laws requiring compulsory attendance are enforced with rigor, and consequently the percentage of illiteracy is everywhere very small. The proportion of pupils who advance to the higher grades is very large. In Berlin, during the decade from 1881 to 1891, of the average of about 160,000 scholars in the public schools, about 9,000 were in the gymnasia, about 5,600 in the realschools of the first class, about 10,000 in the various trade and technical schools, and about 133,000 in the common schools. In Saxony, of 600,000 pupils, more than 11,000 were in schools of gymnasium grade. In all the states of Germany trade schools (see below) and schools of agriculture (see AGRICULTURAL COLLEGE) occupy a prominent place, and are generously supported.

**France.**—Before the Revolution the schools of France

were for the most part under the direct or indirect control of the clergy. Napoleon saw the necessity of thorough and comprehensive reorganization. His method (see *Reforma during the Consulate* under NAPOLEON I.) was not fortunate. The organization of an educational hierarchy with the university at Paris as its head proved to be so unwieldy that the primary and secondary schools never acquired life or efficiency. While the Germans were demonstrating the success of local boards of control acting under a wisely framed general law, the French, on the contrary, were showing the inherent weakness of a system that took all power out of the hands of those who were most interested in success. The war of 1870 proved even to the French themselves the superiority of the German system. The law of 1881 provided for a thorough reorganization. The schools were classified under the terms superior, secondary, and primary, and all were placed under the supervision of a Minister of Instruction. Professors in the universities are paid by the state, as are also in part those of the *lycées*. The *collèges* are supported by departments or municipalities, with occasional endowment of chairs by the Government. The normal schools are mainly supported by the central Government, the primary schools mainly by local taxation; but in case of necessity a "supplementary subsidy" is furnished by the general Government for the better payment of teachers. In all the public schools primary education is gratuitous. Of the 4,520,928 children in school in 1891, 3,453,071 were in public schools, and 1,067,857 in schools under private management, but subject to governmental inspection. The system of technical and trade schools is very elaborate, and extends to nearly every vocation. Since 1881 the system of schools of all grades has been made one of the most thorough in Europe, though the French methods of instruction have not yet become equal to those of Germany.

**Great Britain.**—The schools of Great Britain have had a peculiar history. Before the Reformation there were few schools except those connected with monasteries and cathedrals. At the beginning of the sixteenth century sixteen grammar schools had been founded, and this number was increased by as many more during the reign of Henry VII., by 63 during the reign of Henry VIII., by 138 in the time of Elizabeth, and by 142 in the reign of the Stuarts. These schools, established under private endowments, were not subject to general governmental control. In the eighteenth century a considerable number of charity schools were founded, largely for the purpose of giving religious instruction. While the charity schools were open to both boys and girls, the grammar schools were open to boys alone. The wretched condition of the English schools in the eighteenth century is amply revealed by the writings of Joseph Lancaster and Andrew Bell. In 1808 the Royal Lancasterian Society and in 1811 the British and Foreign School Society were organized, but they accomplished little except to demonstrate the need of governmental assistance. In 1816 a select committee on the condition of schools was appointed, with Henry Brougham at its head; but its achievements were mostly limited to the dissemination of knowledge. It was not till 1832 that Parliament made its first appropriation of £20,000 for the erection of school-buildings. In 1835 and 1838 committees of inquiry were appointed, and in 1839 a committee of the privy council on education was established. The first fruits of this committee were the establishment of model schools and the appointment of inspectors of all aided schools. The system thus entered upon was rapidly developed, and in 1858, when the annual grants amounted to £830,000, a member of the privy council was raised virtually to the position of minister of education. The result was a revised code in 1862, which swept away many of the worst features and made the distribution of funds depend on the efficiency and standing of individual schools. In 1867 the royal commissioners reported that of 3,000 endowed schools, 782 had been designated in the articles of endowment as grammar schools and the others as charity schools. This law was violently opposed as too radical, but it was followed by the much more radical Education Acts of 1870 and 1871, with which the name of the Right Hon. William E. Forster is inseparably connected.

These memorable acts, which may be regarded as the corner-stone of the present English system of elementary education, may be summarized under the following heads: (1) That either by voluntary organization and effort, or by the compulsory establishment of school boards, the supply of elementary schools should be made sufficient for all the school districts in the kingdom. (2) That every such ele-

## II. PRIMARY SCHOOLS.

This term is here applied to those schools which are planned to furnish the elementary education necessary for citizenship and for the ordinary duties of life. Such schools are now almost universally supported by the state. In point of time, they occupy the children from about the sixth to the fourteenth year, or during the first eight years of a course of study, the kindergarten not being included. Where schools are graded this period is frequently divided in the U. S. into primary, intermediate, and grammar departments. The obligation of the state to provide instruction for all its children is a modern conception. In ante-Christian society education was largely a state concern, but it was confined exclusively to the more wealthy classes. From the time of Christ practically to the beginning of the nineteenth century, all elementary education was controlled by the church. Occasionally the state intervened when a ruler more enlightened than his fellows took some step in advance. But the great achievements in this field have all been accomplished in the nineteenth century.

*In Great Britain.*—Until well into the nineteenth century primary or elementary education in England was practically left entirely to the care of the clergy of the Established Church. Parliament in 1832 for the first time voted money to aid in the building of schools. In 1846 money was first given for increasing the salaries of teachers; in 1853 grants began to be made according to the number of pupils in attendance; while in 1862 these grants were made to depend on the successful passing of examinations. The Elementary Education Act of 1870 as subsequently amended regulates elementary education in England and Wales, while the act of 1872 extended the system to Scotland. The central authority is a committee of council on education, the acting chief being the vice-president, who is a member of the cabinet. The local administrative unit is the district, to form which boroughs and parishes are grouped together. Each district has a school board, which may compel parents to send their children to school. Under this law, sufficient school accommodations must be provided in every district for all children between the ages of five and fourteen. The obligatory subjects of instruction are reading, writing, arithmetic, drawing for boys, and needlework for girls. Optional subjects are singing, geography, sciences, algebra, modern languages, cookery, and some others. Religious instruction is given. There are seven grades, and each pupil should pass one grade each year. After passing the fourth grade, the children may, if twelve years of age, leave school. This education became practically free only in 1891. The system of paying for results, or, in other words, giving grants in proportion to the number of examinations passed, still prevails, and with all its faults seems to have a strong hold. The schools are local or denominational institutions. The state aids them, but does not manage them. The managers of any schools may cut loose from the governmental connection at any time, the state's rights to supervision being based solely on its contributions to financial resources. The business of inspectors is solely to ascertain and report on the efficiency of the schools. Probably in no country is there so large local independence and power to adapt the school to the needs of the country as in Great Britain.

The schools of Scotland have long been famous. Here from 1695 to 1872 elementary education was regulated by the act of James VI., which ordained that every parish should have a school supported by revenues derived from the land, the teachers being appointed by the heritors and the presbytery of the Established Church. By the Elementary Education Act of 1872 the Scotch education department was instituted, and each borough and parish, or group of parishes, was required to have a school board to administer both elementary and secondary education and to enforce the attendance of children from five to fourteen years of age. In Ireland, since 1845, elementary education has been under the superintendence of the commissioners of national education in Ireland. Of these national schools

there were in 1893 8,459, having on their rolls 832,545 of the 939,694 children of school age.

*In Germany.*—The school laws of Prussia are, with slight modifications, the standard in all the German states. Thorough organization of the school system dates from the prostration of Prussia after her crushing defeat by Napoleon. The reform in education undertaken under the leadership of von Humboldt began first with the university, then extended to the secondary schools, and presently primary schools felt the same impulse. Since 1816 Prussian common schools have been usually considered the best in the world. The attendance on the schools is compulsory. The law of 1838 provided for making instruction free. About 18 per cent. of the cost of the schools is borne by the state and the rest by the community. The minister of ecclesiastical, educational, and medical affairs, a member of the cabinet, is the head of all the educational institutions of the kingdom. The course of study is prescribed in general outlines by the central Government, and the appointment of teachers must be approved by the Government. The course of study in the elementary schools includes religion, reading, writing, arithmetic, geography, singing, drawing, natural history, and history of man. Needlework and household economy is taught to the girls. Instruction in natural history, natural science, and history of man is entirely oral. Physical exercises are prescribed, and every school is provided with suitable apparatus. Industrial education for girls consists of knitting, crocheting, embroidering, sewing, darning, cutting, fitting, and patching, and is found in every school. The study of arithmetic is less extensive than in the U. S. Vocal music is continued through the entire course. The school hours are usually six a day. Schoolrooms are apt to be small and overcrowded. The school year consists of forty-five weeks, with six or seven weeks of vacation. Legal holidays are more frequent than in the U. S. Lessons usually last from forty to fifty minutes. Examinations are comparatively rare, are usually oral, and are conducted in the presence of parents and friends. In Germany, students who are to take a secondary course, as a rule leave the common schools and enter the secondary schools at the age of nine or ten.

*In France.*—The educational reorganization of France dates from the Franco-German war. School management is completely centralized. This was done originally by Napoleon in constituting the University of France. Since 1850 the central school organization has not been officially called university, though in common usage it still is. Previous to 1870 only one important effort had been made looking toward the education of the people. This was the passage in 1833 of Guizot's laws which imposed upon the commune the obligation of establishing primary schools. The law was not well executed. Jules Simon declared that it was the German schoolmaster that conquered at Sedan. As in Prussia after Jena, so in France in 1871 it began to be felt that the school was to be the instrument of national regeneration. The law of 1878 created a fund of 23,000,000 francs for the purpose of establishing necessary schoolhouses. The law of June 16, 1881, made instruction obligatory, that of Mar. 28, 1882, made it gratuitous, and that of Oct. 30, 1886, reorganized education, and declared that within a certain period all public schools should be under the charge of laymen. In 1857 France devoted to primary instruction the sum of 16,523,969 francs; in 1891, 173,372,524 francs, and in no modern country has the advancement in educational lines been so great and so rapid. The course of study for primary schools prescribed by the law of Mar., 1882, comprises moral and civic instruction, reading, writing, the elements of arithmetic and the metric system, history and geography, especially of France, object-lessons and the first notions of science, elements of design, of singing, manual work, needlework in the school for girls, gymnastic exercises, and in the school for boys military training. In the superior primary schools this course is much extended.

*In the United States.*—The school organization of the U. S. shows a general adherence to a certain type, with infinite variety in details. The great local differences work more to the disadvantage of the pupil than they would in Europe, since the people of the U. S. are proverbially migratory, and change of schools, with consequent loss of time, is very common. The success of primary schools is determined by (a) the intensity of public interest, (b) the thoroughness and comprehensiveness of organization and supervision, and (c) the aptitude and training of teachers. There is a general disposition on the part of the people to appro-

the common factor in the support of the common school. The foundation of our schools proper being the common and common-sense and purposes to making in the direction of common and common-sense, making a few superficial laws of government already exist in over half the states and territories. The most common are the inspired curriculum being the study of literature. Early successful efforts have been made to make a mark in the work in introducing better teaching in the common schools. Opportunities for professional advancement are few and still amply inadequate. Superintendents and school commissioners are paid for their labors, leaving the primary teachers to make their own progress. There are many good teachers, but few expert ones. Many experienced observations of the situation that the children in the schools of the U. S. are at advantage behind those of the same age in the better countries of Europe. A comparison of the school work in Great Britain, France, and Germany, as given above, with the system in the U. S. will show where the difference. As the general government has no control over the schools, the U. S. Bureau of Education has been charged with the function of collecting and disseminating information, the school system of each State must be worked by itself. The differences that appear in each country are very great.

C. H. TOWNSEND.

### III. Secondary Schools.

*U. S.*—In the U. S. what is known as secondary instruction uniformly means the youth in the twelfth year of the school study, inclusive, or from about the fourteenth to an accomplished year of life. The classification into primary, secondary, and higher education has been distinctly recognized since the nineteenth century, but as early as 1682 A. D. the teachers had division in the education of their youth into three specified parts, and to the three classes of instruction. As a term of general application, then, secondary school or course is the intermediate of the three periods in the complete educational plan. In the countries of the Old World, as given here, are filled with valuable definitions, but in the U. S. the three rank of higher and of primary education are constantly shifting, thus making the secondary school or course indeterminate. The U. S. Bureau of Education has reported from the forty or more studies taught in secondary schools in the U. S. the following as typical secondary school studies: Latin, Greek, French, German, Italian, Spanish, Philosophy, physics, chemistry, history, geography, U. S. history, English literature, and geology.

*Germany.*—With the exception of Great Britain, and in comparison France, all the European countries have combined the secondary with the German pattern. The typical German curriculum of secondary education is the gymnasium. This course enters into use as early as the sixteenth century, and is a traditional design ordered that all pupils of good reputation, such as the gymnasium, polytechnic, technical, Latin schools, etc., should have to enter at least fifteen. It has properly six classes, counted upward from the seventh, the first, and called sexta, quinta, quarta, tertia, secunda, and prima. In each of the three lower classes the course is one year; in each of the three upper it is two years, making five-year course and years. There are no divisions of instruction and generally two corresponding secondary course, one section comprising the scholars who remain in the school, and the other those who enter at Middleschool. The course is thorough, and the attainments of the graduates at graduation correspond in a general way to the attainments of American students at the beginning of their course in the best colleges. In 1892 a new provision was adopted for these schools, which is here given:

PROVISIONS OF GERMAN GYMNASIUM.

| CLASS | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9  | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 | 28 | 29 | 30 | 31 | 32 | 33 | 34 | 35 | 36 | 37 | 38 | 39 | 40 | 41 | 42 | 43 | 44 | 45 | 46 | 47 | 48 | 49 | 50 | 51 | 52 | 53 | 54 | 55 | 56 | 57 | 58 | 59 | 60 | 61 | 62 | 63 | 64 | 65 | 66 | 67 | 68 | 69 | 70 | 71 | 72 | 73 | 74 | 75 | 76 | 77 | 78 | 79 | 80 | 81 | 82 | 83 | 84 | 85 | 86 | 87 | 88 | 89 | 90 | 91 | 92 | 93 | 94 | 95 | 96 | 97 | 98 | 99  | 100 |

Attention is called to the provisions for religious instruction in Germany, and to the great number of persons who by the time of the gymnasium are required of students. Such by such with the gymnasium, make the real gymnasium and real school the better having Latin and in Greek and the better neither Greek nor Latin. These three last-mentioned are required in plan and purpose fairly well in the classical, Latin, German, and English courses which are found in the U. S. and by such in the same high schools. The way to any high position in the army, in the government service, and in all professional lines in Prussia is through some one of the higher schools. The right to one year voluntary military service, instead of the three years required of the conscripts, is one which belongs to every German youth who completes six years of the course in any one of the three higher schools. Graduates of the gymnasium are admitted to the universities, and to the study of any of the learned professions, as well as to the practice of teaching in all the branches. Graduates of the real gymnasium are excluded from the learned professions, and may study only with the philosophy and faculty of the university, and may become teachers only in mathematics and modern languages, but are thus qualified for positions only in real schools. The same high quality for admission to the technical high schools. Teachers in the gymnasium must be graduates of a gymnasium, who have attended a university three years, passed a severe government examination, and taught then on trial for two years. There is an ascending salary-scale for length of service. At the age of sixty-five teachers are entitled to a pension.

*In France.*—In France the system of education has been entirely reorganized since the summer of 1875-76. Secondary education is cared for by the lycées and communal colleges. Of these the representative establishments are the lycées. Pupils enter at eight years of age, and are expected to spend a year in each class, completing their course at eighteen. The discipline is rigid and rather mechanical. Both communal colleges and lycées have teaching departments. The scope of the instruction given is not materially different from the German standard.

*In Great Britain.*—In Great Britain there is no secondary education at the expense of the state, and for the great mass of children who go through the elementary schools there is no further opportunity, except in the numerous grammar schools and academies, both endowed and private, which are found there, but over which the Government has no direct control. The great public schools of England correspond to the best and most expensive private-endowed schools in the U. S. All are boarding schools, with their own traditions and customs. None of these schools have been distinguished by special commendation as particularly the public schools, although there are forty or more. Two of these nine are day schools. The others, which are unquestionably public schools, are, with the dates of their foundation—Winchester, 1087; Eton, 1440; Shrewsbury, 1561; Westminster, 1580; Rugby, 1567; Harrow, 1571; Charterhouse, 1092. These schools are for the most part well endowed. Eton, for example, has an annual income of about £200,000.

*In the United States.*—The earliest representative of the secondary school in the U. S. was the academy, which flourished in New England and New York. At the close of the eighteenth century New York had nineteen of these schools and Massachusetts about an equal number. They were to be found in almost every State, and were the characteristic educational agency of the period. Their course, not planned solely with reference to preparing for college, was frequently followed by a college education, but more often not. Of these schools the Boston Latin school, founded in 1635, was the earliest. Other notable ones are the Hopkins Grammar schools at Hartford and New Haven, Conn., 1657; German-town Academy, Germantown, Pa., 1764; Province School, Bedford, Mass., 1765; Phillips Academy, Andover, Mass., 1778; Phillips Exeter, N. H., 1781; and Flatbush Academy, New York, 1787. There soon developed two distinct types of secondary schools—public high schools and the private endowed schools or academies. The public high schools seem to have succeeded in large measure to the work of the old New England academies, which sought not so much to train for college as to give the best possible education for life to those who came within their influence. The academies, which sprang up in connection with the early colleges as preparatory departments in the same house, in the Eastern States at least, nearly disappeared and have been succeeded by the private endowed schools, which aim mainly to fit their

pupils for the different colleges, though they are managed in entire independence of these colleges. In Massachusetts, as early as 1797, the academies were virtually incorporated into the system of public schools by receiving endowments of land from the State. In 1834, by an act of the New York Legislature, the regents of the university were required to apply the surplus income of the literature fund beyond the sum of \$12,000 to the education of common-school teachers by distributing it to such academies as should undertake their instruction. Philadelphia organized a high school in 1837, the first of the kind in the U. S. outside of Massachusetts. Baltimore followed in 1839, Cincinnati in 1850, Chicago in 1856. The New York Free Academy was organized in 1849. Courses of study in the different high schools vary, as the schools themselves are subject to local influences. Private endowed schools also have different courses shaped mainly by the influence of the college to which the majority of their graduates are sent. Most public high schools receive and educate both sexes in the same class-rooms and under the same teachers. In a very few of the larger cities there are separate high schools for girls and boys. The following statistics on secondary education in the U. S. as to students and teachers in public high schools and private academies are taken from the report of the commissioner of education for 1890-91:

| PUPILS, ETC.                | Public high schools. | Private academies. | Total.  |
|-----------------------------|----------------------|--------------------|---------|
| Students .....              | 211,000              | 99,000             | 310,000 |
| Preparing for college ..... | 25,058               | 20,907             | 45,965  |
| Sex—male .....              | 85,000               | 51,000             | 136,000 |
| female .....                | 126,000              | 48,000             | 174,000 |
| Teachers* .....             | 8,270                | 6,281              | 14,551  |
| Male .....                  | 3,745                | 3,041              | 6,786   |
| Female .....                | 4,525                | 3,100              | 7,715   |

\* Incomplete; there are probably at least 20,000 teachers in secondary schools in the U. S.

The constitutions of at least twenty-two States specify high schools as the object of legislative and general interest. The newer States universally recognize the high schools as part of the State system of education. In the East, Massachusetts has gone so far as to compel the offering of high-

school advantages to all her children. As high schools can not be established within easy reach of every one, the State pays for carrying children from sparsely settled districts to the nearest village or city high school. The public high schools are relatively best and strongest in the Western States; the private and endowed academies in the Eastern States. The question of introducing military drill and tactics in public schools is beginning to be agitated. In most high schools participation in military drill is yet optional.

Provisions for the preparation of secondary teachers are meager as compared with such provisions in the foremost European countries. The best secondary teachers are college graduates, who, however, rarely have been able to obtain any special professional training. Colleges and universities are beginning to establish chairs in pedagogy to supply this professional training in some measure. A unique contrivance to meet a special want is the summer school for teachers, a feature in many leading universities. These schools are attended largely by secondary teachers, who find opportunity not only for studying their own specialties, but also in most cases for taking work in psychology and pedagogy.

No account of secondary schools would be complete without mention of the work of the committee on secondary-school studies appointed by the National Educational Association July 9, 1892. This committee consisted of ten prominent educators. It appointed nine sub-committees or conferences, each numbering ten, on the various subjects comprising the secondary curriculum. These sub-committees met in Dec., 1892, and prepared elaborate reports, which were transmitted to the central committee as material for their work. The report of the main committee, with the reports of the conferences as an appendix, was published by the U. S. Bureau of Education in Jan., 1894, and has since been the center of educational discussion in the U. S. The committee prepared four model programmes for secondary schools, which are inserted below. No school is known to be actually following any one of these; but since the report appeared a number of schools have modified their programmes to conform closely to these model programmes, and it is certain they will form for some years to come the standard toward which a large number of schools will more and more closely approach.

C. H. THURBER.

\* In any school in which Greek can be better taught than a modern language, or in which local public opinion or the history of the school makes it desirable to teach Greek in an ample way, Greek may be substituted for German or French in the second year of the classical programme.

most persons who prepare for teaching follow that business for life, so that the number of new teachers that must be supplied each year is comparatively small, but little over 5 per cent., the average length of service for Prussian teachers during the last 50 years being 16.9 years, while in the U. S. about 30 per cent. must be renewed each year. This fact greatly enhances the cost and labor of preparing teachers in the latter country. To supply trained teachers for all schools it would take—e. g. in the single State of Illinois alone—142 normal schools, each having 100 students (the usual number in a German normal school), a three years' course of study, and graduating 33 students annually. Illinois has in reality two State normal schools, each graduating from 25 to 50 persons every year—that is, instead of furnishing the 4,000 or 5,000 new teachers needed, the normal schools of that State furnish less than 100 annually. (2) The attendance in German normal schools is unbroken save by accident, so that each year there are nearly as many graduating as entering students; but in the U. S. the attendance is so irregular that rarely more than a fourth or a third as many students graduate as enter. This irregularity of attendance causes discontinuity in study, and explains the fragmentary nature of the instruction in the average normal school. (3) As a rule, the preparation enjoyed by students of German normal schools is of uniform amount and excellence, being special instruction in public or private schools for three years after the close of the Volks-school course at the age of fourteen, and concluded by a public examination before school commissioners. The preparation for entrance to normal schools in the U. S. varies much, ranging from that given in the poorest country school to that furnished by the best city high schools. Under such conditions the German method of training teachers can be much more effective in every way than can that in the U. S., with its broken attendance and great variety in preparation. (4) The supply of learned and skillful teachers in Germany being practically unlimited, and the direction of the normal schools being in the hands of state officials and educational experts, it naturally follows that these schools are supplied with thoroughly efficient corps of instructors; whereas in the U. S., in which no such body of trained teachers exists, and where the administration of the normal schools is intrusted to State boards who concern themselves with business rather than with educational affairs, it is not surprising to find a teaching corps in the normal school which varies as much in preparation and fitness to teach as the student body itself does in scholarship and ability.

The normal schools of the U. S. and Germany are practically agreed as to the need of training-schools in which the students may have an opportunity to observe and practice teaching under criticism and direction. The training department usually covers the field of elementary instruction, sometimes including on the one hand the kindergarten and on the other the high school. In Germany it is common to have one class to represent the ordinary country school. In general the student teacher prepares more trial lessons and teaches less in the practice school than is customary in the U. S. Thus there is in Prussia one trial lesson a week for each student during the second and third years, whereas class-teaching in the training-school is reserved for the last year. In the normal schools of the U. S. it is usual to give the actual conduct of a class in the early part of the second year, but it is less common to have repeated trial lessons under searching criticism, followed by thorough discussion on the part of teachers and students.

The following table exhibits the amount and distribution of professional and academic work that is accomplished in the German normal schools, and will furnish a basis for further comparisons:

| SUBJECTS.   | HOURS PER WEEK EACH YEAR. |         |        | Per cent. of whole. |
|---|---------------------------|---------|--------|---------------------|
|   | First.                    | Second. | Third. |                     |

| 8. Mixed choir singing.....   | ..                        | ..      | 1      |                     |
| Total required.....   | 37                        | 37      | 32.1   | 100.0               |
| XII. FRENCH (optional).....   | 3                         | 3       | 2      |                     |

It can be seen from the foregoing table that no subject is pursued for less than one year, while many subjects, such as history, geography, drawing, gymnastics, and certain branches of music, are studied throughout the entire three years. Many other subjects are pursued continuously for two years. It is curious to notice that the number of hours per week assigned to any given subject does not exceed two, except for arithmetic and algebra, biblical history, and teaching in the training-school. On the other hand, the normal schools of the U. S. usually pursue whatever subjects they have in hand for four or five recitation periods of forty-five or fifty minutes each per week.

There has been a decided movement in many States of the U. S. for the abolition of all academic instruction in normal schools, the argument being that the State should not have to pay for this, since the academies and high schools profess to impart academic knowledge. It is declared that the high schools should teach the *what* and normal schools the *how*. This movement has resulted in securing perhaps a higher grade of academic instruction, but it has nowhere driven it out of institutions for the training of teachers.

The conditions of admission to normal schools in the U. S. do not greatly vary in the different States, and may be summarized as follows: (1) The candidate must be not less than sixteen years of age; (2) must possess sound health and a good moral character; (3) must be able to pass a satisfactory examination in reading, spelling, writing, arithmetic, and the elements of English grammar, or be a graduate of an accredited high school; (4) must sign a declaration of intention to teach for a certain specified time, usually two or three years, in the common schools of the State. In city normal schools it is often customary to require graduation from the high school as a condition of admission. That the actual instruction in normal schools is not, or at least need not be, so elementary as might be inferred from a study of the curriculum that follows, becomes evident when the age of the average normal student is considered. Answers from twenty-four representative State normal schools show that the average age at graduation is twenty-two years. Since, however, their courses do not exceed three years in length, it is clear that the average entrance age

at Marseilles, by Martin at Marmontier, and by Honoratus on the Leryns, about 400. The schools of Armagh, Aran, and Clonard in Ireland, Whitherne, Lantwit, and Llan Elwy in England, may have been founded in the fifth century, and the school of theology at Constantinople owed its origin in the seventh to an independent movement; but it was the Benedictine order and discipline that gave lasting fame to the foundations of Columban at Luxeuil, St.-Gall, and Bobbio, and efficiency to the great schools of Bangor, Iona, Lindisfarne, Canterbury, and York. The *regula* of Chrodegang of Metz (754), made binding on the entire Church in Aachen in 814, provided for an episcopal school at each cathedral. Both episcopal and monastic schools received enthusiastic support by Charlemagne. His palace school, where Alcuin and Erigena taught, set an example followed not only by Tours and Fulda, Corvey and Ferrières, but also by the cathedral schools of Orleans and Rheims. The tenth century marks the ascendancy of Liège, the eleventh that of Le Bec. In this Norman cloister Lanfranc and Anselm laid the foundations of scholasticism, and their influence was quickly felt in Chartres and Rouen, in Glastonbury and Oxford. The mendicant friars brought the heritage of Le Bec to the new centers of learning.

**University Schools.**—From the thirteenth century theological schools began to be connected with the universities. The *studium generale* rarely had its origin in an episcopal school, never in a monastery. Of the forty-six universities founded before 1400, twenty-eight had at the outset no theological faculty, having generally grown out of city schools, medical schools, or law schools. Among the other eighteen many were new creations and some sprang from private schools like that of Abelard. But the Franciscans and the Dominicans, besides founding their own colleges, gradually secured generous representation on the theological faculties. Probably no other school of theology ever enjoyed the prestige of the Collège de Sorbonne. The theological course at Paris (twelfth century) was open only to masters of arts and covered ten years, five for the baccalaureate and five for the licentiate. The student began with a biblical course familiarizing him with the literal, tropical, allegorical, and anagogic interpretations. This was followed by dogmatics based on Lombard's sentences. Instruction was given by lectures, repetitions in the colleges, and disputations. Substantially the same rules prevailed in all mediæval universities. In advance of Cambridge (twelfth century), and next to Paris in importance, was Oxford (twelfth century). Toulouse was founded in 1229, Coimbra in 1291, Salamanca in 1355, and Valladolid in 1418. Bologna had no theological faculty until 1362; but Rome (1303), Pisa (1343), Florence (1349), and Padua (1363) taught theology at the beginning. Prague (1347) was the first German university. Then followed Vienna (1365), Erfurt (1379), Heidelberg (1385), Cologne (1388), Leipzig (1409), Rostock (1419), Freiburg (1457), Tübingen (1477), and Mayence (1477). Geneva had a university in 1368 and Basel in 1460, Upsala in 1477 and Copenhagen in 1479. Famous Louvain (1431) reflected the wisdom of the *fratres docti*.

**Modern Catholic Schools.**—The Renaissance inaugurated a new era. Classical antiquity returned, the Semitic world drew nearer, the physical universe expanded and attracted minds emancipated by nominalism, and the religious life demanded greater earnestness and freedom. The intellectual forces of the modern world began to operate. But the renaissance influence has been felt in varying degrees in different parts of Christendom. While the Romance and Teutonic nations claimed the heritage of Byzantium, the Slavs, so long under her tutelage, had not yet reached their majority. But the Orthodox Church, by nurturing national life and letters, has proved a faithful tutor in Russia, Servia, and Bulgaria, not less than in Roumania and Greece, and these nations are making rapid progress. The religious academies of St. Petersburg, Moscow, Kiev, and Kasan may not be consciously affected by Occidental thought, but they are flourishing institutions, and especially devote praiseworthy attention to non-Christian religions and to missionary history. The universities of Bucharest (1869) and Czernowitz (1876), as well as that of Athens (1837), have theological faculties.

The Roman Catholic Church owes it largely to a new order of theological schools that her influence, still so marked in the Romance nations, has survived the Renaissance. By the establishment of colleges, at the universities or independently, embodying Sturm's humanistic and their own religious principles, Loyola and his successors sought

to meet the demands of the age for spiritual earnestness, classical learning, and biblical erudition. Few schools have attained the efficiency of the Collegium Romanum (1550). The *studia superiora* comprised four years of philosophy, three years of positive or biblical theology and dogmatics based on Thomas Aquinas, and three years of casuistry. Other famous colleges were the Germanicum (1552), the Anglicanum (1580), the Claramontanum at Paris (1562), and those of Pont à Mousson (1572) and Dijon (1581). Clerical seminaries were also established at Rome (1585), at Milan (1572), and elsewhere by Borromeo, and subsequently in every Roman Catholic country. Had the searching criticisms of the Port Royalists been heeded, the Society of Jesus might have been saved from spiritual decay and loss of power. When, in 1773, Clement XIV. dissolved the order, it had 669 colleges and 176 seminaries, and controlled 80 theological faculties; but its moral influence was so shattered that not even the restoration of 1814 could rehabilitate it. Its system of education still survives, but scarcely to the profit of the Church. To this day Italy depends upon her 217 seminaries, no Italian university having a theological faculty. Spain is equally dependent, and though Coimbra teaches theology Portugal has many seminaries. France is better provided, with her Roman Catholic faculties at Paris, Lille, Lyon, and Toulouse. At Vienna, Salzburg, Budapest, Cracow, Innsbruck, Agram, and Gratz Roman Catholic theology is taught, and Prague has both a Czech and a German faculty, but there are forty-three seminaries besides in Austria. Freiburg (1457), Munich (1826), Münster (1773), Würzburg (1582), Bonn (1818), Breslau (1702), and Tübingen have Roman Catholic faculties. Besides Louvain, Belgium has sixteen seminaries. Since 1854 Ireland has had a Roman Catholic university at Dublin. England has twenty-seven Roman Catholic seminaries.

**German Protestant Schools.**—In the independent Teutonic churches the Renaissance bore richer fruits. The influence of Luther was strongly felt in the universities already leavened with humanism, and there the study of Lutheran theology remained in touch with other departments of learning. Luther's suggestions were nobly carried out by Melancthon. Under his presidency Wittenberg (1502) became a great center, and other universities modeled their instruction after it, as Marburg (1529), Tübingen (1536), Leipzig (1539), Königsberg (1544), Greifswald (1545), Rostock (1563), Heidelberg (1551), and Jena (1558). The change involved an extension of the biblical course, interpretation of the Hebrew and Greek texts of the Scriptures, and greater attention to Augustine. The theological faculty became an arbiter in doctrinal matters. In the period of orthodoxy occasioned by this arrangement, Giessen was founded in 1607 and Kiel in 1665. Metaphysics had crowded Bible study and personal piety into the background, when Spener and Francke made their plea for faithful exegesis and living experience, and embodied their ideas in the University of Halle (1694) and the *seminarium ministerii ecclesiastici* (1714). The indifference of pietism to theology as a science undermined orthodoxy and paved the way for rationalism. In the opposition against supernaturalism Göttingen (1737) became a leader. Kant's *Critique* made this conflict meaningless by a higher synthesis, but the new theological development started with Schleiermacher's and Hegel's teaching at Berlin (1810). To their influence the still dominant tendencies emanating from Baur in Tübingen, Reuss in Strassburg, and Ritschl in Bonn are largely traceable. Scientific methods prevail in the biblical departments and find increasing application in Church history, dogmatics, and practical theology. The professors in the seventeen evangelical faculties are free to present their own views and to modify them as research demands. Their lectures are the prominent feature. Disputations are seldom held. Seminars and theses try the student's strength. A triennium leads to the doctorate in philosophy, three additional years suffice for the licentiate. The doctorate in theology is conferred either *rite* or *honoris causa*, the recipient recognizing the honor by dedicating a work to the faculty. The annual average of doctors of divinity made in all Germany is forty.

**Other European Schools.**—The Universities of Upsala and Lund (1668), Christiania (1813), Copenhagen, Helsingfors (1827), and Dorpat (1832) supply the clerical needs of Sweden, Norway, Denmark, Finland, and Lutheran Russia. Preachers' seminaries have also been established by the Moravians at Gnadefeld and Nisky, the Baptists at Hamburg and Stockholm, the Methodists at Frankfort and Upsala, and the Congregationalists at Christinehamn. In

to the physicians of Philadelphia prior to 1751, and Dr. Hunter, of Newport, R. I., gave anatomical demonstrations in 1754-56. Dr. William Shippen, Jr., of Philadelphia, gave a course in anatomy to twelve students in 1762. These were all private enterprises. The first regularly organized school of medicine was the College of Philadelphia, which was founded by Dr. William Shippen, Jr., and Dr. John Morgan at the suggestion of Dr. John Fothergill, of London, in 1765. Dr. Morgan was appointed to the chair of Medicine in May, 1765, and Dr. Shippen to the chair of Surgery in September of the same year. The first course of lectures was given in Nov., 1765, and continued annually thereafter. The College of Philadelphia subsequently became the University of Pennsylvania.

The requirements for the degree of bachelor of medicine were: (1) A satisfactory knowledge of Latin, mathematics, natural and experimental philosophy; (2) one course of lectures in anatomy, materia medica, chemistry, theory and practice of physic and clinical lectures, and one year's attendance on the practice of the Pennsylvania Hospital and a public examination; (3) apprenticeship to a reputable physician.

The requirements for the degree of M. D. were: The candidate, being twenty-four years of age, and a bachelor of medicine of three years' standing, must present and defend an original thesis. The degree of M. B. was first conferred in 1768, and of M. D. in 1771.

The second medical school in North America was founded in New York in 1767 in connection with King's (now Columbia) College by Dr. Samuel Bard and Dr. Peter Middleton. The degree of M. B. was first conferred in 1769, and of M. D. in 1770. It was broken up by the Revolutionary war, but was reorganized in 1792 and merged with the College of Physicians and Surgeons in 1807. The third medical school was founded in connection with Harvard College in 1783, the fourth in connection with Dartmouth College in 1798, the fifth was the Maryland College of Medicine in Baltimore (now the University of Maryland), founded in 1807, and the sixth at Yale College in 1813.

From this date the growth of medical colleges was rapid, until almost every large city possessed one or more. Many, like those at Castleton, Vt., Berkshire, Mass., and Fairfield, N. Y., were established in small country towns independently of any institutions of learning or hospital facilities, and gave purely theoretical instruction by lectures, the effect being to lower the standard of medical education. In some schools a single course of lectures was exacted prior to graduation; in others two courses of four months each; in the vast majority two courses of not more than six months each; and in comparatively few colleges three courses of lectures. Since 1890 a movement to lengthen the number of courses to three, and in some cases to four, has gained strength, to the great advantage of medical education.

*Requirements for Admission to Medical Colleges.*—Prior to 1892 no uniform requirements for admission to medical colleges existed in the U. S. In 1892 the Association of American Medical Colleges established the following standard: (1) Ability to write an English composition of not less than 200 words. (2) To translate simple Latin prose. (3) A knowledge of algebra or higher arithmetic. (4) Elementary physics.

The regents in the State of New York require that all applicants for admission to medical schools must file a certificate showing:

(A) That they hold a degree of bachelor or master of arts, of bachelor or master of science, or of bachelor or doctor of philosophy; or, (B) That during or prior to the student's first year of medical study he has passed an examination conducted under the regents of the University of the State of New York, or by the faculty of a medical school or college in accordance with the standard and rules of the said regents, in arithmetic, grammar, geography, orthography, American history, English composition, and the elements of natural philosophy; or, (C) That he possesses one or more of the following equivalents:

(a) A certificate of having successfully completed a full year's course of study in any college or university under the supervision of the regents of the university, or registered by them as maintaining a satisfactory standard. (b) A certificate of having satisfactorily completed a three years' course in any institution subject to the visitation of the regents, or registered by them as maintaining a satisfactory academic standard. (c) A certificate of having passed the examination preliminary to the study of medicine, required

by the present medical act of Canada. (d) A certificate of having passed the matriculation examinations of any university in Great Britain or Ireland. (e) A regent's diploma. (f) Regents' pass-cards for any twenty counts not including reading and writing.

Many medical colleges in the South and West do not exact even these modest requirements.

A few medical schools require more, e. g. the University of Michigan, which requires an elementary knowledge of English, mathematics, including arithmetic, algebra and plain geometry, physics, botany, zoölogy, physiology, history, and Latin prose.

The requirements of Harvard Medical School are: English, Latin, physics, chemistry, and any one of the following: French, German, algebra, plane geometry, or botany.

The Johns Hopkins Medical School, at Baltimore, Md., requires: (1) An ability to pass the matriculation examination to enter any undergraduate course at the Johns Hopkins University; (2) a reading knowledge of French and German; (3) a knowledge of minor courses in physics (at least five class-room exercises and three hours' laboratory work each week for one year constituting a minor course), chemistry (five class-room exercises and five hours' laboratory work each week for one year), and biology (five class-room exercises and five hours' laboratory work each week for one year, or the degree of A. B. in the chemical-biological course of the university).

*Courses of Study.*—The best medical courses are graded and cover a period of four years. In the most advanced schools the first two years are spent in the study of anatomy, embryology, physiology, histology, bacteriology, pathology, physiological chemistry, and pharmacology; the third year is devoted to the study of medicine, surgery, gynecology, and obstetrics, and the fourth year to clinical work and special branches of medical practice. In the first two years laboratory work occupies a prominent place, and recitations and seminary conferences are held rather than formal didactic lectures.

Many schools have three courses of lectures which practically cover identical subjects, but this method of instruction is no longer popular, and laboratory work and graded recitations are fast taking the place of didactic lectures.

Medical educators differ as to the advisability of requiring a degree in arts or sciences preliminary to the study of medicine, and many are of the opinion that the majority of young men can not afford to sacrifice the time needed to secure a degree before commencing a course of medical study proper, extending over a period of at least four years. They prefer the arrangement of studies existing at Cambridge, England, whereby the last two years of study for the degree of B. A. constitute the first two years of medical study leading up to the degree of M. D. at the end of three years thereafter, thus practically giving a medical course of five years.

*Requirements for Degree of M. D.*—The requirements for this degree vary materially. In some schools in the U. S. the degree is conferred after three years of medical study and an attendance upon two courses of lectures. The majority of the medical schools since 1892 have required three courses of lectures. The leading schools require four courses of lectures and practical work in laboratories.

*Number of Schools.*—In 1891 there were 95 regular, 9 eclectic, 14 homœopathic, 2 physio-medical colleges, and 9 post-graduate schools of medicine, with 18,160 students and 4,931 graduates receiving the degree of M. D.

II. *Canada.*—There are 12 medical schools in Canada. The requirements for admission are English, arithmetic, algebra, geometry, Latin, and Greek, French, German, or natural philosophy.

*Courses of study* extend over four years. During the first and second years, anatomy, physiology, histology, chemical physics, general chemistry, materia medica and therapeutics, toxicology, and botany. During the third and fourth years, theory and practice of medicine, including medical pathology; principles and practice of surgery, including surgical pathology; clinical medicine, clinical surgery, midwifery, diseases of women and children, medical jurisprudence, and sanitary science.

In Quebec the requirements for admission to the medical schools are nearly equal to the medium requirements for admission to the schools of Great Britain.

III. *Great Britain.*—*Requirements for Admission.*—*Minimum.*—English, Latin, mathematics, including algebra and geometry, elementary mechanics, and one of the following optional subjects: Greek, French, German, Italian, or

in modern languages: Latin, Italian, English, elementary German.

**Second year.**—Latin, Greek, French, German, Sanskrit or some two such languages, history and geography, mathematics, mechanical sciences, one of the following: chemistry, physics, and finally, experimental physiology and botany.

**Third year.**—Latin, French, Sanskrit and Sanskritized Hindi, Sanskrit, and short passages to be translated into Sanskrit, German, French, Greek, grammar and translation in a selected work. English language composition, literature, and history. French or German, grammar, and Sanskrit or English mathematics—arithmetic, algebra, trigonometry, geometry and trigonometry; geometry, plane and solid, with the elements of coordinate geometry; trigonometry. There is a special test in the examination for the B. A. degree at Oxford, Cambridge, and London.

The process of study except at least five years. After leaving the second course the students spend several years in the London University.

**Fourth year.**—The applicant for admission must present evidence of having successfully passed the final examination of the previous course. Eight semesters must be devoted to medical study. The first four are devoted exclusively to physics, chemistry, zoology, botany, mineralogy, anatomy, and physiology. The purely medical studies begin in the fifth semester, and must be pursued for two years. **First year.**—The applicant for admission must possess the degree of bachelor in letters, and the "diplôme de bachelier en sciences exactes," which are equivalent to a B. A. of London University, with considerable knowledge of French, English, history, zoology, and elementary solid geometry of solids. These must be pursued at one of the principal faculties of France, viz. Paris, Montpellier, Lyons, Lille, Lyons, and Rouen, and must cover four years.

**Second year.**—Physics, chemistry, anatomy and dissection, zoology, physiology, and histology; second year, anatomy and dissection, histology, general pathology, surgery, physiology, and anatomy, physiology, medical psychology; third year, anatomy, surgery of pathology and clinical medicine; fourth year, anatomy, surgery, and clinical medicine; fifth year, anatomy, surgery, and clinical medicine; sixth year, anatomy, surgery, and clinical medicine; seventh year, anatomy, surgery, and clinical medicine; eighth year, anatomy, surgery, and clinical medicine.

**Third year.**—*Quadratura et Adversaria.*—Latin, mathematics including algebra, geometry, plane trigonometry, and astronomy, mechanics, elementary physics, chemistry, and natural history.

**Fourth year.**—Medical studies are to be pursued at one of the universities of the University of Italy. The courses are to be pursued in the order of studies, but the following order is generally observed: First year, zoology, anatomy, dissection, chemistry; second year, physics, organic chemistry, comparative anatomy; third year, anatomy, physiology, fourth year, general pathology and pathological anatomy; fifth year, general pathology and surgery and anatomy, physiology, anatomy, surgery, and clinical medicine; sixth year, anatomy, surgery, and clinical medicine; seventh year, anatomy, surgery, and clinical medicine; eighth year, anatomy, surgery, and clinical medicine.

**Fifth year.**—The applicant for admission must present evidence of having successfully passed the preliminary studies. The courses must be pursued at Upsala or Lund, or the Medical University of Stockholm. The period of study is ten years. The first three years are spent in preliminary studies, the last seven years spent in the study of anatomy, physiology, and pathology of chemistry, general pathology, pathological anatomy, and pharmacology. Two years are spent in the study of practical medicine, practical surgery, ophthalmology, dermatology, and forensic medicine. In addition there is a special course in a medical and surgical clinic, four years in a medical clinic, and two months in a psychiatric clinic.

**Sixth year.**—The following is a summary of the courses of study in Europe: 1. Germany, 2. Denmark, 3. France, 4. Greece, 5. Great Britain, Scotland, and Ireland, 6. Italy, 7. Netherlands, 8. Austria-Hungary, 9. Norway, 10. Sweden, 11. Portugal, 12. Russia, 13. Switzerland, 14. Spain, 15. Sweden, 16. Turkey, 17. United States, 18. Venezuela, 19. West Indies, 20. Zanzibar.

HENRY M. HARRIS.

## THE LAW SCHOOL.

**General remarks.**—With the revival of interest in medicine, the students devoted to the medical universities, medicine, dentistry, and pharmacy, and in countries where the study of law is considered to be the foundation of obtaining

the law, the legal education at a university is still maintained. Indeed, upon the continent of Europe a university law school is almost essential to the legal profession. In Germany, for example, the student for and studying at a legal school is almost essential. He must first complete the education of a jurist, he must first study law for three years at a university and pass an examination at the end of the course, after this theoretical study, he must, if he wishes to be a judge or an advocate, spend three years in the "service of practical preparation." Then, upon passing a second state examination, he may expect an appointment as an inferior judge when a vacancy occurs, or, if he prefers to practice, he may be admitted to the body of advocates. One wishing to be a law professor disposes with the three years of practical work, and seeks first, by passing a special examination, the position of private docent. His subsequent promotion to assistant professor and professor will depend wholly upon his ability and success as a private lecturer, for the ranks of the law professors are recruited, not from judges and successful practitioners, but exclusively from those who have won their spurs as younger teachers. What is true of Germany is, in the main, true of the other continental countries.

**In England.**—The history of legal education in England has been widely different. The English law was not Romanized and English lawyers were not bred at Oxford or Cambridge. Since the fourteenth century legal education has been in the hands of the four Inns of Court, Lincoln's Inn, Gray's Inn, the Inner Temple, and the Middle Temple. These, with the ten dependent Chancery Inns have been called by foreigners and taken a legal university. In the days of these writers the term was not inapt. The membership of the Inns of Court was made up of students, barristers, readers, and benchers. A student after eight years was admitted to the degree of barrister. From the barristers of longest standing were chosen annually two readers, each of whom was to give a dozen readings or lectures to the members of the Inn, and to preside at meetings. The readers after performing these duties became benchers or governors of the Inn. The two courses of readings were delivered in vacation, and each reading with the discussion that followed between the reader and some of the barristers occupied the morning hours. In term-time the members of the Inns would naturally be engaged in the business of the court. Both in term-time and vacation much time was given after dinner and after supper to bittings, i.e. conversational arguments upon cases put to the students by a benchman and two barristers sitting as judges in private, and to meetings, which were public arguments by barristers before the benchers. This continued discussion of points of law could not fail to develop legal acumen and the art of ready speaking. But the readings and the discussions came in time to be regarded as too great a burden. They were at first shortened and finally, in the latter half of the seventeenth century, given up altogether. Membership in an Inn of Court for three years became the sole requisite for a call to the bar. A legal education being no longer obtainable in the Inns of Court, students of law turned to private reading, supplemented at first by experience in attorneys' offices; but after Lord Mansfield's time the chambers of special pleaders, conveyancers, or equity draftsmen were resorted to instead of attorneys' offices. Since the middle of the nineteenth century attempts have been made to convert the Inns of Court into a general law school, but there has been very little success. Annual courses of lectures on five subjects have been introduced, upon four of which students must pass examinations before being called to the bar. The attendance at these lectures is not large. At Oxford and Cambridge there are courses both in Roman and English law, but the attendance is small. Another generation may see the establishment of a true law school, but private study and the attendance at the chambers of a barrister are still the normal mode of learning law in England.

**In the United States.**—This same method was not only adopted so far as practicable by the English colonists in North America; but the English distinction between the upper and the lower branches of the legal profession was not falling, the law work of the barrister and the business of the attorney being united in the same person. For this reason the office of a lawyer in the U. S. regarded as a place for legal training, was distinctly inferior to the chambers of the English barrister. It is doubtful even now of the independence of a law office to give a satisfactory legal education that is due the early origin and later widespread success of the

American law school. It is claimed that the earliest law school in the U. S. was at the College of William and Mary in Virginia. Chancellor Wythe was certainly appointed Professor of Law in that college in 1779; but it may be doubted if a law school, in the proper sense of the term, existed there at that time. Be this as it may, the famous school at Litchfield, Conn., may justly be regarded as the parent of law schools in the U. S. This school was established by the Hon. Tapping Reeve in 1782. The Hon. James Gould was associated with him in 1798, and after Judge Reeve's retirement in 1820 remained in charge of the school until its discontinuance in 1833. This school was eminently successful in attracting a high class of students from all parts of the U. S., the average attendance being about twenty-five a year. The course, with two months' vacation, occupied fourteen months. The instruction was by lectures, thrown into the form of legal treatises, specimens of which may still be seen in *Reeve's Domestic Relations and Gould's Pleading*.

Mention should be made of sporadic and ephemeral courses of lectures delivered by Judge James Wilson at the College of Philadelphia in 1791 and 1792, by James Kent, Esq., afterward Chancellor Kent, at Columbia College, New York, in 1797, and by Prof. Stearns at Harvard College from 1815 to 1817. But it is still true that the Litchfield school was for many years without a rival, the Harvard Law School, the oldest of all existing law schools, not being established until 1817. The first dozen years of this new school were full of discouragement. Most of those who desired a law-school education still resorted to Litchfield, or, during the years 1823-29, to another successful private school at Northampton, Mass., conducted by Judge Samuel Howe and John Hooker Ashmun. The prosperity of the Harvard school dates from its reorganization in 1829 when Judge Story and Mr. Ashmun were appointed professors. In 1833, when the Litchfield school was given up, there were law schools at Harvard, University of Maryland, Yale, University of Virginia, Cincinnati College, and at Transylvania University, Kentucky, with less than 150 students in all. There were two new schools in the next decade, at Dickinson College, Pennsylvania, and at the University of Indiana. Five more were established between the years 1846 and 1850. In 1860 the number of law schools had risen to twenty-two, with a total attendance in that year of about 1,000 students. The following table gives the law schools existing in the U. S., with the date of their foundation, the length of the course, and the number of students in the academic year 1893-94:

| NAME OF LAW SCHOOLS.                    | Date of establishment. | Length of course, years. | Number of students in 1893-94. |
|---|------------------------|--------------------------|--------------------------------|
| Harvard.....                            | 1817                   | 3                        | 353                            |
| University of Maryland.....             | 1822                   | 3                        | 146                            |

\* Prior to 1895-96 the course was two years.

Fifty-three law schools have been organized since the civil war—seventeen in the period 1890-95. There were 3,006 students in law schools in 1888-89, and 7,804 in 1893-94. This shows the rapidly growing conviction that a legal education is best acquired in a law school. It is noticeable also that at only eight of the seventy-five schools is the course limited to a single year. In eleven the course extends over two years. It is highly probable that in a few years a majority of the schools will have the three years' course. Furthermore, but seven of the seventy-five schools are university schools. The significant feature of legal education in the U. S. will be seen, is the wide departure from English tradition in favor of study with a practicing lawyer and the closer approximation to the continental principle of university legal training. This result has been reached not by imitation of continental methods, but by an independent development. There are still important differences. Upon the continent of Europe the student's attendance at the university law school is compulsory, while in the U. S. it is optional. In continental countries a collegiate education is a prerequisite to admission to the law school. In the U. S. the great majority of law students have no academic degree, and the standard of admission requirements is lamentably low, although gradually rising. The Harvard Law School, indeed, after the academic year 1895-96 will, with rare exceptions, give the degree of LL. B. only to college graduates.

*Methods of Instruction.*—There is, as yet, no consensus of opinion as to the best mode of teaching law in a law school. In the European universities the professors teach almost wholly by lectures, but the *seminar* courses, in which the students and the professor discuss the original authorities, are growing in favor. In American law schools, also, in early days the instruction was generally given in the form of lectures, but since the multiplication of legal treatises the lecture method has been largely superseded by the recitation method. The student reads a certain number of pages of a given text-book, upon which he is catechised in the classroom by the professor, who also expounds and criticises the treatise. In 1870 the inductive and genetic method, which is almost universally adopted in the teaching of other sciences, was for the first time used in the teaching of law. To Prof. Langdell, dean of the Harvard Law School, belongs the honor of this innovation. The chief merit of the new system lies in its development of the habit of intellectual self-reliance. The text-books used contain, instead of treatise or commentary upon the original sources, but the original sources themselves, being collections of cases and arranged as to show the historical development of legal principles.

gested and compact body of facts and principles before its application to practical problems can be undertaken with assurance of success. The splendid researches carried out by a generation of scholars now passed away were essential to successful development of the school of technology, and in a still greater degree were the methods of scientific investigation necessary to that development. Observation and experiment came to the front, and for the first time in the history of education began to be esteemed at something like their full value. It came to be understood that the path to success was not alone through the study of books, but that the study of things was more important. What is known as the "laboratory method" of instruction began to be adopted in the most progressive institutions of learning, and soon proved itself to be vitalizing and powerful. All other departments of learning were forced to become the imitators of science in the use of this method, and the "new education" resulted. Many feared the effect upon the courses of study tending to produce what was long erroneously called a "liberal education," but it was soon found that if the simple "culture effect" be considered alone, the new education asks no odds of the old, while in the production of sound thinking and a virile intellectuality it is far and away ahead.

All of this was a necessary forerunner to the perfectly organized school of technology, but as a matter of fact the development of the latter was in a large measure contemporaneous with the evolution of the new education as outlined above. A class of professional schools has existed, indeed, almost as long as education itself, namely, those organized and maintained for the training of clergyman, lawyers, and physicians. Military schools have also long been in existence, and out of these latter came the beginnings of technical instruction.

In Europe this beginning is to be found in the creation of the celebrated *École Polytechnique* in France, in the third year of the Convention (1794). It was primarily for the training of young men in mathematics and drawing, to fit them for the Engineer and Artillery Corps of the French army. It owes much of its excellence to the labors of Carnot, who strove to give it a secure and proper foundation. The number admitted to its classes was limited, and only the best of the candidates were selected. Some of the most celebrated military and civil engineers of France have received their training there, and it has numbered among the members of its faculty such famous men as Lagrange, Laplace, Berthollet, Poisson, etc. It continues to adhere with considerable conservatism to the principal methods of its early history, and, in spite of innumerable competitors that have sprung up since its foundation, its rank is among the highest.

The famous School of Mines at Freiberg, earlier in its establishment by many years, has enjoyed a long and illustrious career, and is an excellent type of a technical school differing very decidedly from the *École Polytechnique*. In its early development, amid the rich mining resources and industries of Saxony, it illustrates the general principle that nearly every one of the first technical schools owes its origin to the demands of the leading industry in its immediate vicinity, by which also the character of its instruction was largely determined. Influenced largely by this principle, schools of technology became very numerous throughout continental Europe during the first half of the nineteenth century. Most of them have kept pace with the extraordinary development of science and scientific methods which has taken place during the last half of the century; their facilities for instruction have increased, and their courses of study have become largely professional. The polytechnic school has begun to assume its proper place in European schemes of education as something quite distinct from the earlier trade schools, from which, however, it was in many instances evolved. Besides France and Germany, Austria, Sweden, Switzerland, and Russia have maintained technical schools of high repute. Indeed, the U. S. is indebted to Russia more than to any other nation for some of the most important and valuable features of the modern school of technology. It was at two famous Russian schools, the Imperial Technical School, at Moscow, and the Institute of Technology, at St. Petersburg, that the experiment was first made of combining in the engineering courses the study of text-books, lectures, and other exercises long known to form a necessary part of scholastic training, with practical exercises in workshops in which the student was made familiar with machines, their construction and use, and the

nature of the materials upon which they worked. Many of the older and more conservative schools in Europe have been reluctant to follow the example of the Russians, but the numerous and great advantages of the method have been recognized in England and in a still greater degree in the U. S., where nearly every school of technology has adopted the Russian plan in a greater or less degree.

Great Britain, although contributing more largely, perhaps, than any other nation to those scientific discoveries upon which all technology is based, was slow to realize the necessity for technical education. It was not until it became evident that France, Germany, and other nations of continental Europe were likely, through their encouragement of technical schools and colleges, to deprive the United Kingdom of the prestige of first place in engineering and manufacturing skill, that the British began to develop this side of their educational system. Much interest was suddenly created, royal commissions were appointed, the work of foreign countries was examined and reported upon, and organized efforts resulted in the rapid advancement of the interests of technology. One organization, extensive in scope and comprehensive in plan, deserves more extended notice, even in a brief treatment of the subject. It is the City and Guilds of London Institute for the Advancement of Technical Education. The Prince of Wales is the president of the institute, and among its vice-presidents are the lord mayor of London, the president of the Royal Society, the president of the Institute of Civil Engineers, and many other of the most eminent men of Great Britain. The operations of the institute include the management of three London colleges and the system of technological examinations. The three colleges are the City and Guilds Central Technical College, which is "a college for higher technical instruction in mechanics and mathematics, civil, mechanical, and electrical engineering, and chemistry," the City and Guilds Technical College at Finsbury, and the London Technical Art School. The scheme of technological examinations is very elaborate and ambitious. Examinations are conducted once every year at various centers in the United Kingdom, upon a wide variety of technical subjects, more than sixty in number. Prizes and honors are awarded, and in some cases grants of funds are made. The object is to encourage local development of technical education, and the results are commensurate with the magnitude of the undertaking.

In the U. S. the earliest foundation for technical education was that of the Rensselaer Polytechnic Institute at Troy, N. Y. It was established in 1824 by Stephen van Rensselaer as a School of Theoretical and Applied Science. In the early years of the republic it was the necessary custom to employ learned and skilled foreigners in various public works, and most of the engineers at first engaged on the construction of canals and roads came from France. Many young men were sent there from the U. S. to be educated, and the Rensselaer School evidently owed its origin to a desire on the part of its founder to create an institution capable of supplying this demand. Its work has been mostly confined to the education of civil engineers, in which it has had a long and successful career.

About the middle of the century the importance of the sciences of chemistry, physics, geology, etc., had become so evident that several of the more important colleges established special departments for scientific work. The old education still held sway, and was at most only willing to admit the new as a sort of annex, but carefully avoiding responsibility in most cases by providing quite a distinct organization for the scientific school. The Sheffield Scientific School of Yale University was the earliest of these, having been founded in 1847. It was followed by the Lawrence Scientific School of Harvard University in 1848, and the Chandler Scientific School of Dartmouth College in 1852. The first two were for a long time schools of science rather than its applications, although they have latterly taken more of the character of schools of technology with thorough courses in several branches of engineering. The school at Dartmouth College has confined its work largely to civil engineering. All have done work of a high order.

Technical education in the U. S. received its greatest impetus, however, during the later years of the civil war and those first following its close. This must be attributed to two causes: First, the passage of the Morrill Act by which large land grants were made to the several States for the purpose of enabling them to establish institutions for giving instruction in agriculture and mechanics; second, the very

ized. General industrial schools, in which a number of trades are taught, are found throughout the two empires, while special trade schools, in which one particular branch is dealt with, are distributed according to local needs. Thus there are special trade schools for silk-weaving, linen-weaving, watch-making, wood-working, mason-work, machine-work, brewing, etc. Courses in these schools are generally from three to five years in length, and embrace, besides practical trade-training, instruction in mechanical and free-hand drawing, geography, business forms, mathematics, book-keeping, and science. From the nature and extent of the instruction many of these schools should more properly be classified as technical schools, and even when the object is merely to combine the elements of a general education with the training of a handicraftsman the large amount of time required prevents their benefits being very generally reaped by the artisan class. The actual effect of these schools is in consequence rather to prepare a limited number of graduates fitted for superior workmen and foremen than to supply a means of training the great mass of artisans.

The aim of the Belgian schools approaches more nearly to that of a true trade school than those of the schools just described. Trade proficiency rather than an all around education is the end sought. Mental instruction is indeed generally provided, but its character is limited to such branches as have a direct bearing upon the trade. Besides a number of institutions supported by guilds and trade-unions, as well as several parochial schools in which practical trade-training is furnished, two very comprehensive trade schools exist at Tournay and Ghent. In these schools the pupil upon entering selects a special trade, which he pursues for a course of three years. Instruction is given in these schools in drawing, mathematics, science, and industrial economy.

In no country is the character of trade and technical instruction more differentiated than in France. In each of the French schools the grade of product aimed at, whether it be artisan, foreman, superintendent, or engineer, is accurately defined. Of the first mentioned class are the manual apprenticeship schools, into which boys are admitted at twelve or thirteen years of age. These schools are municipal institutions receiving state aid. They are in fact elementary trade schools which devote the greater part of a three years' course to practical manual work. The aim is not to turn out full-fledged workmen, but rather to shorten the period of apprenticeship. Mental instruction to the extent of three or four hours a day is given throughout the course. There are schools of this character in Paris for the mechanical trades, for bookmaking, and for furniture-making. Other schools exist at Havre, St.-Etienne, Rheims, Nantes, and St.-Chamond. Besides these municipal schools there exists a system of national apprenticeship schools, which are divided into primary and secondary grades. The primary schools are similar in character to the municipal schools, but afford somewhat more advanced instruction. In the three secondary schools at Châlons, Angers, and Aix, the instruction in both theoretical and practical branches is very thorough, and is such as to fit the graduates to become superintendents and masters of industrial establishments. The course is three years in length, and pupils must be between fifteen and seventeen years at entrance.

**Great Britain.**—In Great Britain trade schools (with one or two possible exceptions) do not exist. There are a large number of technical schools representing a great variety of aims and methods in which workshop instruction plays a part, but the principle almost universally obtains that a trade can only be properly acquired in a regular shop.
